Refining Sorghum.—The culture of sorghum for syrup has had to combat prejudices of long standing in favor of molasses from the Southern cane, and of sugar-house syrups, cheapness being the prime inducement to purchasers of sorghum syrup. This has had a good market in spite of a peculiar flavor, more or less disagreeable, which it was impossible to remove. We have always felt that the one thing needed to establish sorghum as a northern staple crop, was a process of easy and perfect refining and deodorizing. We are inclined to believe that such a process has been discovered by Mr. Wm. Clough, and is now being introduced by a responsible company. Mr. Clough has exhibited his simple and inexpensive process to us, and astonished us by the complete and rapid removal of foreign and disagreeable flavors, odors, and solid dirt of all kinds from samples of sorghum syrup. This discovery appears to warrant the expectation of such a revolution in sorghum syrup and sugar making as will essentially and prosperously affect our farming interests everywhere.

Flat Culture for Corn.—"H. D.," Hampton, N. J. Hilling is discarded by the best cultivators. The plants will do their own bracing, better than you can do it for them, if you will thoroughly work the soil and keep down the weeds. The rain is more equally distributed and better retained with flat culture.

How Much Land to Support a Family?—"T. K. B.," Burlington, Vt. "Mechaness of land is a disease of the American mind. 'Ten Acres Enough' is a stumbling block and foolishness. In England there are many farmers who support large families on six acres, and pay large rents into the bargain. In Germany a farmer calculates to support his family on two acres, and get rich on the other three of his five-acre farm. None but market gardeners, in this country, have formed any adequate conception of the productiveness of good land, when worked up to its full capacity.

Cultivating Wheat.—"B. V.," Bethlehem, Pa. This is done to a considerable extent in England, and is one reason of the large crops harvested there. If the wheat is sown in drills, it is not difficult to pass a cultivator, with the teeth set the same distance apart as the drills, between the rows. All cereal grains would be as much helped by cultivating as is corn.

"Native Cattle."—"A. I.," Dutchess Co. There is no distinct breed of this name. The first importations to this country were from England, Holland, Sweden, and Denmark, and at the South from France and Spain. These were taken of necessity rather than from choice. They had no common likeness, and have been bred without reference to forming a distinct breed. It takes a great many years of skillful breeding to form a distinct race that will perpetuate its own good qualities. We have such races, or breeds, in the Short-horn, the Devons, etc., and a man can find almost any thing he wants in an ox or cow in some one of these breeds.

The Noxious Insects of Illinois.—

First Annual Report by Benj. D. Walsh, M. A., Acting State Entomologist. We should think that the title should have been *Active* State Entomologist. We believe that the appointment is not settled yet definitely, and Mr. W. very modestly signs himself Acting State Entomologist—and he is right, for he has acted very much like one, and presented a report of over 100 pages, which we have only glanced at. We can see that it is very characteristic, by which we mean that things are put in a plain and forcible way, and that the author says what he thinks is right, no matter how weighty may be the names in opposition to him. This we like, and are prepared to get much useful information from his report when we get time to peruse it. In the mean time we congratulate Mr. Walsh and our Illinois friends upon having established a relation that we doubt not will be mutually beneficial. When people are fairly instructed as to the habits of insects, they will then know the tactics of the enemy and be able to fight it. When the people know these things, the peddlers of tree medicines will meet with small sales. We regret that Ohio failed to appoint a State Entomologist. The amount of his salary for several years would have been saved to the people in one year if he had done nothing but take a cluster of the eggs of the tent-caterpillar and gone from town to town and lectured on that one insect alone.

The Diana Hamburg Grape.—

This variety was exhibited at the meeting of the Pomological Society at Rochester in 1864. We have not heard much of it since, save that the vine was tender. We had a vine of it in an experimental collection of the newer varieties, pruned it last fall, and left it unprotected like the rest. This spring we found it alive to the last bud, and more forward than any other variety save the Black Hawk. As far as this goes it would show this variety hardy in the vicinity of New York.

The Ives Grape Again.—

A gentleman writes us from Indian Hill, Ohio, that on notice of the Ives Grape in April "has created a good deal of surprise, not to say indignation here, at the head-quarters of that matchless wine grape." Our statement, to which exception is taken, is this: "When we discuss quality, we must put the Ives very low." But our friend omits what follows: "If it is a question of adaptability to, and profit in particular localities, then it takes a high rank." Now we don't know how we could put the Ives on any farther grounds. Our correspondent will not contend that as a grape it is equal to the Delaware, Diana, or Catawba. But it is a grape that he can grow, and we say by all means grow it. We have been blamed so much in other quarters for saying a good word for the Ives, that it seems a little odd to have one of its friends "down on us." Now we say very distinctly, that while we cannot rank the Ives high for "quality,"—by which we mean, in comparison with the grapes already named—we do think it a valuable addition to our list of grapes, and repeat what we said in April: Grow the best grapes you can; if the Ives is the best grape you can grow, let it be the Ives.

Sundry Queries.—

J. Bruck, Miami Co., Ill. "Will the crab-apple answer for raising dwarf apple trees?" We do not know what you mean by "crab-apple," as that term is applied to both wild and cultivated trees. The Paradise stock makes the most dwarf trees. "Has the Wild Locust ever been used for hedging with success?" If by "Wild Locust," you mean the Honey Locust, or Three-thorned Acacia, a tree with inconspicuous flowers and showy fruit—not the locust so valued for timber, and with long bunches of white, pea-like flowers—yes, it is one of our most valuable hedge-plants. "Are Peach trees grafted on Wild Plum secure against borers?"—No.

Peach Planting and Peach Prospects in Maryland.—

A friend of ours, who has gone into peach culture in Maryland, sends us the following account of what he is doing, and what appear to him the prospects of the crop in that region. It is on the Md. and Del. R. R., not far from Ridgely Station: "I have had many men and several teams, preparing about twenty acres—fencing, ploughing, digging, etc.,—for planting between 7,000 and 8,000 peach trees, 1 have this morning here now, of very fine trees, of 1 think mainly the best sorts, to wit: Hale's Early, (large proportion); Troth's Early Red; Early York; Large Early York, (Honest John); Haines' Early, (said by some to be same as the preceding); Crawford's Early Melocoton; George the Fourth; Grosse Mignonne; Crawford's Late Melocoton; Stump the World; Old Mixon Free; Ward's Late Free; Snock's Late Free; Morris' White. I have not yet seen any person, to be relied on, to give me a full list of best market sorts. After passing Clayton and Smyrna, in Delaware, towns not answering well to the dignity of the famous names they bear, I began to see peach and other fruit trees

blooming finely, and giving present promise of doing all that trees can towards an ample supply of the market. Notwithstanding the abundant bloom all along the road I traveled, in Delaware and Maryland, I have heard a few express doubts of a good crop. But I have examined for myself, and cannot doubt there will be as many peaches on almost every tree of adequate age as it can well hold. I think there are promising germs of peaches in five out of six of the blossoms; and these will be found more than the trees can well mature. I admired many of the peach orchards I saw—some very large—by the wayside or near, and obviously under good care and culture. Some appeared quite otherwise, yet even they are this year struggling to exhibit a fair amount of fruit. I observed one large orchard of small peach trees, averaging, I should think, but about five or six feet high, with compact, symmetrical heads, all blooming beautifully. It was doubtless in good hands, and if I may speak of a peach tree's purpose, every tree designed to reward well the care bestowed upon it."

Raising Seedling Strawberries.—

Those who wish to go into the difficult matter of crossing and hybridizing are referred to the special works upon the subject. On this point we may remark that we have little confidence in many of the alleged crosses, as the operation is attended by difficulties and requires the utmost care. The fact is, our best varieties have in them such a variety of blood, so to speak, that we are not surprised at any thing they may do from seed, even when self-fertilized. In raising seedlings, select the finest berries from the most productive plants, crush them with dry sand enough to separate all the seeds, and sow the sand and seeds in a well-prepared bed, in a shady place, or in boxes of earth where they can be properly shaded and watered. It is better to sow the seeds as soon as ripe, but if desired to keep them until the next spring, the berries may be crushed, the seeds washed out, dried, and kept like other seeds. The seeds should be sown in a light, rich soil; they will come up to a month or six weeks after sowing, and make good-sized plants before winter. Those in boxes should be transplanted to the open ground when large enough to handle, and proper attention to watering and shading given all through their early growth. The first winter, the seedling plants should be protected by a covering of leaves or litter. Fruit is borne the second year sometimes, but generally the third. Blackberries, raspberries, and other small fruits, may be sown in the same manner as strawberries.

Hemlock for Hedges.—

"M." You have answered your own question, and place a just estimate upon the hemlock. The trouble is that young trees from the forest are not sure to live. They should have a year's probation in a nursery row, which should be naturally or artificially shaded. The young hemlock trees that live through the first year with this treatment can be used for a hedge or screen with confidence.

Grubs Again.—

Geo. W. Dodge, Bureau Co., Ill. thinks that Mrs. Chappellsmith, whose observations we gave in April last, is wrong in her charges against the Tumble-bug. He says: "The Tumble-bug deposits but one egg in each ball, and the young only emerges as a perfect beetle, the mature serving as food for the grub until it changes into the pupa form. There is no doubt whatever about this, as we have opened them in all stages of development. If Margaret Chappellsmith will open some of the balls a few weeks after they are buried, I think she will find some lesser than 'seventy' grubs, and I hope she will no longer blame the poor Tumble-bug for hiding his ball in her strawberry bed, rather than leave it in the maize heap, or bury it in the hard path." This is a matter of observation which can be readily decided. We find in our European exchanges many articles concerning the larva of their Cuckoo-beetle, which seems to be the equivalent of our white grub, the larva of our May-beetle. All applications to the soil in the way of special manures are found to be worthless as far as the destruction of the grub goes, and it is found to pay, even in field crops, where these pests abound, to employ children to follow the plow and hand-pick them.

Toad Shelters.—

"B. H." Milton, Pa. The gardener has no better friend than the toad. He loves insects, and will devour a multitude of them. He wants no better shelter than a board raised an inch or two from the ground, by pitting small stones or blocks underneath. Here he can have his coveted retreat, and digest bugs, when he has caught enough to stock his larder.

A Southern Item.—

With an increasing Southern subscription, we get many Southern letters. We cannot print all of them, yet we trust our friends will not feel that we are ungrateful of their favors. Now, here is a note from Memphis, Tenn., which, even in June, is enough to make those of us who live farther north, envi-

ous of the enjoyments of the writer. "Kent" writes as follows: "This latitude is about the northern limit of the *Magnolia grandiflora*, a beautiful evergreen, with its large, glossy leaf, and its magnificence, yet delicate white, fragrant blossom,—almost too fragrant,—and quite too frail for a touch, as that causes it to change its color very soon to reddish brown; so that it is difficult of transportation. The mildness and brevity of winter encourage the cultivation of flowers; the earlier ones, as the Crocuses and the Hyacinth, being looked for to open in Feb., while the roses continue on nearly or quite through Dec. In the open air. Of course, the interval can be filled with a variety of heavy, and of insidious fruits. We are having green peas from our open gardens; had radishes 30th March; strawberries and new potatoes in market, from New Orleans. Last year 'we' had strawberries the 5th of May; dewberries 10th of June. Some of our most successful transplanting of shrubbery was done in Jan.; but these early 'fits' have their drawbacks, as they start out vegetation too early—as in the case of the strawberry—the first blooms having been blighted, both this year and last, by the cold weather. Last year fruit was mostly a failure from this cause. Fruit prospects at present are good. On the whole, this region holds out its full share of encouragement, both from soil and climate."

Medicinal Plants.—

In many parts of the country people are very properly looking about for new fields of industry, and among many letters we have a number asking about the production of drugs, such as Opium, Rhubarb, &c. With every desire that our country shall produce, as far as possible, the articles that it consumes, we cannot hold out any strong inducement in the way of raising drugs, and for this reason: The value of drugs is governed much by climate and soil. The same Rhubarb which in Asia will produce a valuable root will here produce a worthless one. The common Hemp, which no one here suspects of any medicinal effects—though it sometimes suddenly terminates life—in India produces a gum which is one of the powerful articles of the *matéria medica*. Foxglove (*Digitalis*) in cultivation is about worthless, while in its native localities it is a most potent drug. Now, to all those who have written us upon these matters we must say that the thing is too uncertain to allow of any investment. It presents an excellent field for experiment, but no drug raising that we can at present think of promises as a speculation. We are sometimes asked about our native drugs, such as Bloodroot, Mandrake, &c. These are consumed in large quantities, and in the apothecaries' stores have a high price, but any one who has lived in the West, where these things are gathered, knows that the store-keepers get them "in trade" at a ridiculously small price.

Crooked Lake Gone.—

The great vineyard region of the State of New York was now Crooked Lake. We used to get our best grapes from Crooked Lake. Valuable experience and words of wisdom used to come from the borders of that beautiful but crooked sheet of water. But Crooked Lake is no more. It has not dried up, nor has the bottom fallen out, but it has had its name changed to the aboriginal Kenka.—May its vines bear as abundantly, may its fruits be as luscious, may its people be as hospitable and as happy, and—may it help it with all their Indian-osity—may the lake be as crooked as ever, even if it is called by a new name, which everybody will be sure to confound with Cayuga.

Propagating from Green Wood.—

A. Wilder, De Kalb Co., Ill. We can only understand your question as referring to the propagation of grapes, raspberries, &c., from green wood, i. e., the young growth of this spring. We cannot advise you to try it unless you have a suitable propagating house; it will be of no use, as a general thing, to attempt it in the open air.

Information Wanted.—

Will any of our friends who have well-tested recipes for dyeing—especially for carpet warps—please give them. Red and green are the colors most asked for, and we would like plain directions, with the quantity of materials required for a given weight of stuff. Will "A Subscriber," at Brackton, tell us how she colors her materials for rag carpet?

Mowing Machines.—The Decision

of Paris.—John A. Fellows asks: "Will you please inform me and many others who desire to know the truth, through the columns of the *Agriculturist*, which Mowing and Reaping Machines did take the premiums at the Paris Exhibition of 1867. Several claim this honor, and we desire to know the truth from disinterested parties."—*Answer*: Through the politeness of Mr. J. C. Derby, U. S. Agent, we have received the "Official Catalogue of the Products of the United States of America, exhibited at Paris in 1867," etc., printed in English, French, and

German. It appears that there were five American-built machines entered—three mowers and reapers, one mower, and one reaper. These were entered by C. H. McCormick, Chicago; Clipper Mowing and Reaping Machine Co., New York; W. A. Wood Mowing and Reaping Machine Co., Housick Falls, N. Y.; J. G. Perry, Kingston, R. I. (Mower); Seymour, Morgan & Allen, New York, (Reaper). The prizes awarded were a Gold Medal to McCormick, a Gold Medal to the W. A. Wood Co., and a Bronze Medal to Perry. The decision of Paris in 1887 is not an "apple of discord"—for though important and creditable to those concerned, yet no decision is given concerning the rival claims of the two machines, which, as we understand it, divide public favor in Europe, and the decision certainly will have very little influence in favor of these machines or against their competitors here, and which were not represented in Paris. The two parties who take gold medals are the only American Mower and Reaper manufacturers who have made especial efforts to secure an European Market for their machines—having for years had agents there, having there taken out numerous patents, and having put themselves prominently before the European public in various ways.

Weigh your Milk.—"G. R.," Orange County. "Three pailfuls a day," is a very indefinite statement, and may mean twenty-five, or thirty-five quarts, beer measure. In all statements of the yield of milk, it is best to give the weight. Accurate knowledge is of great importance to the dairyman. He should know just how much each cow gives in the flush feed of summer, that he may determine what cows it will pay to keep, and what should be turned off in the fall for beef. With a set of Family Scales in the milk-room, a pail may be weighed in a second, and the result noted in a book kept for the purpose. Weighing, too, every day, would enable one to determine whether extra feed paid. The farmer might get rid of guess work, and know just what he was about.

Self-Milking Cows.—The importance of stopping at the very beginning any tendency in a cow to suck herself, need not be dwelt upon. The habit, once fixed, is an exceedingly great disadvantage, and such cows occurring near cities, usually "tie up" at some milk stable where they are kept constantly tied. Mr. E. A. Conkling recommends the occasional application of a solution of aloes to the cow's teats, and says its efficiency is confirmed in his own experience. "R. W.," of

Ingersoll, recommends a simple bit of board inserted in the nose, as shown in the engraving. An oval hole, 3 inches long and 2 inches wide, is cut in the middle of the long side, and near the edge of a 4x6x½ inch oak board; then the thin side, which should be about ½ inch wide, is cut out just enough to allow the broad, gristly nose to be crowded through. The hole must be large enough to fit loosely, and the ends which enter the nostrils rounded so as not to scrape or hurt the skin. The application of aloes might cure a case taken early, but we are confident it would not help an inveterate sucker. The other contrivance does not prevent eating; and, though we think it would stop most cows sucking, yet, applied to one of some ingenuity and with long teats, we doubt its efficiency. We give the explanation and engraving because the cure is so easily applied, and will, no doubt, be of avail in many cases. In case the nose-jewel should be caught in any thing, it would probably tear out, or one side would split off, and the cow get no serious harm.

Fish Ponds.—Dr. A. Thomburg, Georgia. There is no doubt about your making fish multiply, if your springs are capacious enough to keep the water running through the summer. The pond would be too small for salmon, and probably too warm in summer for trout. Stock with the best fish in your neighborhood. One kind is enough. See Dr. Garlick on Fish Breeding.

What Calves to Raise.—"Dairyman," Norwalk, Conn. We find the large milk producers for the supply of our towns and cities are decidedly in favor of raising their own cows. They may cost a little more, but they more than pay for the expense, in the quantity and quality of the milk they yield. The difference between an average and an extra milk is fully one thousand

quarts of milk in a season, worth sixty dollars, or half the price of an extra cow. The calves to raise are the heifers of your best milking stock, sired by a thorough-bred bull of good milking stock. This matter is so well understood, that dairymen, who have their eye-teeth cut, will give any reasonable price for a cow who has such a pedigree. It is satisfactory and profitable to raise one's own cows, and see the steady improvement of the breed.

Artificial Manure for Corn in Ohio.

—An Ohio writer asks: "Will it pay to use concentrated manure of any kind on corn, on strong clay loam? If I could raise enough more corn to pay for such manure I would use it, for I like to raise good crops, even if it pays no better. And the next crops would be likely to pay." That is the right feeling. If twenty dollars worth of manure will give you twenty dollars worth of extra crop, it will pay well. The land will be cleaner, and the extra crop enables you to make an extra quantity of manure, and there is scarcely any concentrated manure (we think of none, except nitrate of soda and sulphate of ammonia) that does not leave something in the ground for the next crop. The trouble, however, is to get a manure that will pay on corn the first year. We have never yet found such a manure. Plaster, at \$3 a ton, will pay on corn, and this is the only concentrated manure that has paid us, on ordinary Western New York land. Bone-dust, if genuine, will pay well in two or three crops, provided you can get it for \$30 or \$35 per ton.

Mutton as Manure.

—"M. S. II.," of Warren, Ohio, writes: "I would like to have you advise me what to do with a few loads of the remains of sheep, that were butchered here last fall for their hides and tallow. After the tallow was taken out, the soap makers took what they could get, and now the remains, bones, flesh, and ashes, are all mixed up together. Is it worth drawing three miles, and if so, how can I use it to the best advantage on our soil, which is a strong clay loam?" We would spread the leached ashes and the finer portions of the animal remains on grass land. The solid animal matter, if there is any, we would break up and make into a compost with muck, or soil of any kind. Turn it two or three times, and by next fall it will make a capital top-dressing for grass, or excellent manure for wheat land.

Goats as Milkers.

—"C. S.," Westbury, R. I. Any of your Irish fellow-citizens would inform you that goats' milk is exceedingly wholesome, and raised at much less cost than that of the cow. The great objection to the goat is its lawless habits, when allowed freedom. If kept tethered, as it may easily be, it is as orderly as the horse or cow. It will eat much herbage that is rejected by the larger animals, and may be of great service in clearing up brush pastures, and destroying briars and Canada thistles. A good animal will yield from two to four quarts of milk a day for ten months in the year. The milk is much used in Europe, and is considered more wholesome than that of the cow.

The True Way to Enrich Land.

except in the vicinity of large cities, is to depend on home resources. Along the sea-coast we can use fish manure, or Peruvian guano, superphosphate, etc.; but in the interior, say for instance on a "strong clay loam" in Ohio, it will not pay to send corn a thousand miles to the Atlantic cities, and take back manures to grow it with. Feed the grain on the farm, and send us nothing but beef, pork, wool, etc. On such a soil, "tillage is manure." Cultivate the corn thoroughly. Consider it a summer-fallow crop. Decrease the area of grain crops, and increase the area of clover. Never sow a wheat crop, or barley, or oats, without seeding it down with clover, even if it is to lie but one year. Plow under the clover, or feed it out on the farm, and do your best to make "Ohio oil-cake" become a very scarce article in the English market.

Profits of Egg Raising.

—We have received from "A. P. N.," of Newtown, L. I., an account of his poultry yard, which we must abbreviate, in order to find room both for it and for the lessons which it teaches. The account extends from February to December, 1867. Two hundred fowls, fifteen of which were cockerels, were kept. The egg account runs from 1305 in February, worth \$60, and \$243 in March, worth \$100, to 688 in December, worth \$34.30. The greatest number laid in any one month was in March, above stated; the least in November, 655. The greatest number of eggs laid in one day was 117; the least, 14. The price of fresh eggs, received during the period named, was from 5 cents to 60 cents a dozen. No day of the eleven months passed without some eggs being produced; and no month passed without the production of eggs, the value of which exceeded the cost of feed consumed. The principal feed was wheat screenings, corn, and pork-scraps. The fowls were fed as much grain as they would eat up clean, twice a day; and were supplied with lime and cracked oyster shells,

and ranged together over an acre of ground. They were hatched in three separate apartments, not well constructed, offering cold comfort only in bleak winter weather; with properly constructed and warm apartments one-third more eggs might have been laid during the months of February, November, and December. Mr. N. says, he would warn every one not to engage in this business on a large scale, without experience and a taste for it, in other words, a delight for it, greater than for any other pursuit; for the constant care and persevering attention absolutely necessary to success will be given by only a few persons.

The great profit of egg raising lies in having the hens lay when the market price for eggs is high. To secure this, a good portion of the hens should be young. Liberal feeding is absolutely essential. Animal food should be accessible summer and winter; and pork-scraps is as good an article as can be generally obtained. Warm, light quarters in winter are essential also to success.

Shape of Trout Ponds.

—"Salmo" writes: "It is much the best plan to build trout ponds long and comparatively narrow. Trout brooks in their natural state do not shape themselves into broad squares or circles, in which three-fourths of the water is nearly stagnant, like some of the artificial ponds that we see. It is a pretty safe principle, we know, to imitate nature as closely as possible in our artificial cultivation of natural products, and this principle is certainly never more true than in its application to fish culture. I would therefore recommend as the result of both reflection and experience, to build trout ponds long and narrow—say in the proportion of 1 rod by 4—so that there may be something like a current flowing directly through, and that the trout may know whether they are heading up stream or not."

Grind-Stone for Mowing Machine

Knives.—It is an awkward thing to grind mowing machine knives on a common grind-stone, yet one may be easily dressed so as to be very convenient for this purpose, and yet not be seriously injured for most other uses. The accompanying engraving shows a stone which has had the original edges taken off and brought to V-shaped edge, giving two grinding faces. The exact angle between these faces is immaterial; one of 45 degrees is convenient. Care must be taken not to grind too much on the edge of the stone, or it will soon be rounded off and the angle will be lost. The best stones for this purpose are rather narrow ones, of a firm but not hard texture, with sharp grit, and of even quality. Be careful in grinding not to widen the bevel of the knives, as this gives a weaker edge, dulling quicker, and more liable to injury from striking stones or sticks.

Market Fairs.

—"A. M. S.," Putnam Co., N. Y. These fairs are as much needed in this country as in England, and would be productive of quite as great benefit, both to seller and purchaser. Private sales give the speculator a very great advantage over the producer. He studies the crop prospects, which are much better known in the centers of trade than in any limited agricultural district. A market fair in every county or convenient local center would bring a large number of buyers and sellers together, and enable men to compare views, and fix fair prices. Some attempts have been made to append sales to the annual fairs of agricultural societies, but very little dependence is yet placed upon these occasions to dispose of the products of the farm. Where there are permanent fair grounds, and buildings for the protection of stock and other farm products, the most expensive preparation for a fair is already made.

Chester White Swine.

—"H. T. S.," Angola, N. Y. If we take the popular vote upon the best swine for farmers' use, it is unquestionably in favor of the Chester Whites. At the great State fairs of Michigan, Wisconsin, Ohio, and Pennsylvania, last fall, there were more of this breed in the pens, than of all others united. At Pittsburg the only impression left upon the mind in the piggins was Chester Whites. They are well-proportioned animals, grow rapidly, and make excellent pork. Whether they will make more pork out of a given quantity of food than the Suffolks is a question we should like to see decided by accurate experiments. Many breeders prefer the Suffolks, but the popular verdict is as we have stated. The Chester Whites are widely distributed, and animals for breeding can be had at moderate prices.

Channel Island Cattle.

In making a collection of pictures to illustrate for our readers the cattle of the Channel Islands, we found so great a variety among them, yet such characteristic specimens, that we cannot drop the subject without exhibiting two more engravings of them. One is a mature cow, taken in a strikingly beautiful attitude. We fear our artist will long try in vain to procure a similarly spirited "pose" in the animals which he photographs for us. There is the obvious difficulty in taking cattle and sheep, that it is almost impossible to make them take a position to show their good points and not look stupid and devoid of animation. This engraving comes very near to perfectly satisfying us, and certainly is the best wood cut of a cow

we ever saw. The cut of the Guernsey cow published last month is its equal in every thing but vivacity, and this was gained in the present case by letting the cow's calf gambol on the grass plot at the rear of the photographer. Her owner, Mr. Edward Howe, of Princeton, N. J., writes: "I agree with you that the engraving is a great success and a very true likeness of the cow. Diana is seven years old, a very dark fawn color, with a beautifully developed udder of a rare yellow color. She is of imported stock; her

dam, 'Miss Fannie,' and sire, 'the Bryce bull,' were both imported by Mr. Wm. Redmond." The heifer "Hocy" was two years old last June (the photograph was taken in August). Her owner, Mr. James P. Swain, says: "She was sired by Col. R. Hoe's imported bull Saturn, dam Lap Horn, imported by the late Thos. Richardson. Both parents were from the Island of Jersey. The bull was chosen for his beauty, and the cow selected (out of nearly one hundred imported by Mr. Richardson) for her milking qualities, and was about the roughest specimen of a cow I ever saw of any breed."

SELLING MANURE.—The farmer who sells manure off his place, sells his children's birthright. It may be necessary, to support their lives; if so, well. It may be necessary, in order to obtain money for some pressing need; if so, it would be better, probably, to sell land. It is,

at any rate, putting a mortgage upon the soil, which will probably never be taken up. The mortgage may be removed by the purchase of more manure, or its equivalent; but every year manure grows more and more valuable, and the temptation never to restore it, greater. To the farmer the manure pile is his working capital.

four causes of deterioration—pulling up by the roots, and preventing seeding, manuring, and manuring. No soil can possibly stand this treatment for a long course of years without injury, and very good lands may become so exhausted that it will take years of rest to recover them without the aid of man. Pastures may

be brought up very rapidly with sufficient expense, but the question for the farmer is, how to renovate old pastures economically, and maintain them in a condition of productiveness. Old pastures that have carried a good stock of cattle for many years, and at once begin to fail, usually need phosphates in the soil, and these are best supplied by using bone-dust or some of the phosphatic guanos. Cows fed on these pastures will frequently intimate this lack in the soil by gnawing on bones, and some-

times they become actually diseased because phosphoric acid—that indispensable ingredient both to plants and animals—has been removed from the land. Sowing some kinds of grass seed is often very important, and so great is the benefit of clover, that it will usually pay to buy both red and white clover seed. If the hay from an old natural meadow free from weeds, and yielding a notable variety of grasses, be placed by itself so that the seed may be collected after the mow is empty, no mixture of grass

seed can be better; otherwise, it would probably be well to obtain in addition to both the kinds of clover, the seed of red-top and Kentucky blue grass, called June grass at the East. White clover will often come in abundantly after sowing plaster, and 100 pounds of plaster to the acre will greatly promote the growth of both the red and white on almost any soil. It is not necessary to plow the land, although often a thorough harrowing is useful. The sowing of grass seed with whatever manure

may be applied, and bushing it in, is sufficient. Wood ashes is often one of the cheapest and best dressings. On sandy and gravelly soils, muck or peat that has been weathered a year, twenty cords to the acre, would give good grass. Compost, yard and stable manure, are always good for such lands, and will always pay, if made upon the farm, and certainly some kind of top-dressing should be used to give the

JERSEY COW "DIANA," SEVEN YEARS OLD.

The Management of Worn-out Pastures.

It is a very good pasture that will carry a cow or a bullock to the acre, through the season, and this might oftener be done than it is, on lands naturally good for grass. Instead of this, we have, in most parts of the grazing districts, pastures not half so productive, and in many parts five acres will not support a cow through the summer. The cows are frequently turned in on or before the first of May, before the grass

JERSEY HEIFER "HOCY," TWO YEARS OLD.

is well started, and it is kept close-cropped all through the season. In time of drouth there is no relief for the pastures. Many of the grass plants are pulled up by the roots, as one can see by examining the sod. The cows are kept in yards at night, and most of their manure is lost to the pasture. Few of the grasses have any chance to go to seed; and when winter comes, there is no covering for the roots. Here are

young clover and grass a good start. Finally, give the land a chance to recover, and the grasses time to become well established. They will seed abundantly, and the whole ground will become well stocked with all the varieties that you have sown, and others will fast work in. Then in the following years care should be taken not to overstock. Short grass is damaged both by drouth and freezing. Give ample time in the fall for a covering to grow and protect the roots. Pastures for cows and growing cattle need occasional top-dressings of yard manure, bones, and ashes, to keep up their fertility, while those fed by bullocks or sheep, and occasionally plastered, will grow better from year to year. In milk, and in the frames of cattle raised upon the land, large quantities of the material of which bones chiefly consist are removed—while in the production of fat and wool no such exhausting tax is laid upon the soil.

Walks and Talks on the Farm.—No. 54.

"Nineteen acres of potatoes, 200 bushels per acre, and \$1.25 per bushel, would bring \$4,750." This is a very simple sum in arithmetic. Had I made such a calculation last summer and acted upon it, I might have had to pay an income tax! I had nineteen acres of potatoes, and I sold them this spring for \$1.25 per bushel. The only trouble is, I did not have 200 bushels per acre. "Why?" The common answer would be, "owing to the dry weather." The true answer would be, "poor farming,"—and this arises in a good degree from want of faith in manure and good culture. I have no doubt that \$500 judiciously spent would have put \$2,000 in my pocket. It costs little more to plant and dig a crop of potatoes that yields 200 bushels per acre than one that yields only 75 bushels. There is no other country in the world where good farming, as compared with poor farming, will pay so well as in the United States at the present time. How long this state of things will last, it is not safe to predict. I do not wish to see the price of wheat, barley, oats, corn, beans, and potatoes, as high as at present. It is not healthy. What farmers want is reasonable compensation for their labor, and capital, and skill. Doubtless we shall have a change, sooner or later; and prices may go as much below the true standard as they are now above it. But, on the whole, the indications are that we shall never see as low a range of prices for farm produce as before the war. At all events, I am confident that those farmers who make an effort to clean and enrich their land will in the end make the most money. And the prospects are that they will not have as long to wait for returns as is generally supposed.

An unwillingness to wait is one cause of poor farming. I know a young man whose father has 640 acres of land in Iowa, that he offers to give him if he will work it. He proposes to go out there this summer, and "put in 200 acres of wheat, and then return and spend the winter in Rochester." If he does, he will know more about farming in a year or two than he does now. A few days since I asked a gentleman who commenced life poor and who is now reputed to be worth several millions, how he made his money: "I looked ten years ahead," he replied. This same man has a beautiful farm, and one of the best herds of Short-horns in the State. With a bank account good for a million, most men when they commenced farming would put up a grand house and a "model barn." Not so Mr. Farseeing. He looked "ten

years ahead," and commenced at once to improve his land and lay the foundation for a splendid herd of cattle. I know another gentleman who has a fine farm, an elegant house, and splendid buildings, and takes great pleasure therein; but, said he, mournfully, "I have not a son or a daughter that will stay at home. They all leave me, and it is rare that one of them spends a night in the house. They care nothing for farming." On the other hand, Mr. Farseeing's son takes charge of the farm and attends personally to the cattle, and is as enthusiastic about farming as the father himself. And as we were going to look at the cattle, young Ezra, the grandson, left his swing in the grove to come too, and his father lifted him on the broad back of a fine Short-horn cow as is to be found in the world, and there he sat as proud and as happy as one could wish even a child to be. And grandpa, too, was as happy for the moment as though he was as poor as myself. I do not respect a man merely for his wealth, but I cannot but admire the man who, like the one referred to, habitually looks ten years ahead, and lives and acts for the good of his race.

This same man, having an acre or two of waste land on the farm, has set it out with oaks, white ash, English elm, and other valuable trees. His pear orchard contains a few dwarf trees, but nine-tenths of them are standards. He was willing to wait; and he has not waited in vain, for already one of his standard Seckel trees bears ten bushels of pears a year.

I believe the time is fast approaching when we shall turn our attention to tree planting on hilly land. We have swamps enough growing up with second-growth soft wood, but that is not what we want. Such land, if drained, would be more profitable in grass, and thus add greatly to the beauty of the landscape and the healthiness of the country. But in many sections there is considerable dry land too poor or too hilly to plow or pasture with advantage, that it would pay to fence and plant with forest trees. The late Duke of Atholl planted over ten thousand acres of such land in Scotland, with larches, besides many acres of firs and other trees. And it is said that the timber from these trees, if now brought to the hammer, would sell for the enormous sum of fifty millions of dollars!

You should not speak so disrespectfully of our path-masters. They are useful men. We have too few holidays. Farmers, it is said, live isolated lives, and any opportunity should be improved that calls them together. Working on the road once a year is a social reunion. The young men perform feats of strength and skill, and the old men talk of the deeds of other days. And, on the whole, these gatherings do very little harm. The road, such is our splendid climate, is injured far less than one would expect. The holes they scrape out on the sides fill up again in a few years, and I never knew of any one being drowned in them. The cows, too, I have observed, seem to prefer to wade through the water rather than travel on the road. These holes are generally scraped down to the clay, and the bottom is consequently tolerably firm. This advantage would be lost if the ditch was cut level so as to carry off the water. These firm, clay spots would have to be thrown out. The water, too, would pass off so quickly that instead of standing on the sides of the road it would flood the fields and make it necessary to clean out the ditches and water-courses. Is it not a great deal better to let the water soak

away gradually? In our dry, hot climate it will all disappear, except in a few spots, by the 4th of July. It will not do to have firm, dry roads in the country. It would ruin the Doctors. The women would walk out every day and soon know more about what was doing, and what was not done, on the farm, and in the neighborhood, than their husbands. Even now, some of them want the grass mown in front of the house, and the weeds pulled out of the walks, and they want to send to Vick for posy seeds, and a hot-bed must be made, and they talk about asparagus and cauliflowers. Now, Sir, if they can get about in the spring of the year without having to crawl on the fences, I would like to know where this thing is going to end? Let your wife see a bed of hyacinths in flower, and she'll want just such a bed herself next spring—and what's more, she'll have it. Then the women will be changing seeds and plants, and at night it will be, "John, after you have smoked your pipe, instead of going to the corners, wont you just dig a place for some flowers I got to-day? They will spoil unless they are set out at once." And you'll have to stay at home and do it. You think you wont, but you will. Better nip the thing in the bud. Be careful who you elect path-master. If he should only take it into his head that instead of scraping dirt on to the low, wet places on the road, it would be cheaper to drain off the water from underneath, the evils I have spoken of will come upon us. And it is not improbable, even, that farmers' sons would polish their boots. And then the next proposition would be to have the buildings all spouted and drains cut to carry off the water, so that the young gentlemen could feed the pigs and do other chores about the farm without turning up the legs of their pantaloons.

I received a letter from a farmer in Ohio to-day, asking for advice, which, as I am not acquainted with all the circumstances of the case, it is not safe to give. He says: "I was a farmer's son and had the good fortune to be born poor. I stayed on the farm until I was 17 years old, and then went to a trade. My first earnings were scrupulously laid aside to purchase the farm where I now reside. It contains 103 acres. I am in my fiftieth year, and failing health and the impossibility of hiring skilled labor make things go quite slipshod. Have two sons, the eldest in college, the other too weakly to labor. My wife's health is too poor to have the family increased by work hands. I do not like the idea of selling out, but how shall we manage?"

A man is just in his prime at fifty, and should have as good health on a farm as in a city or village. If he has property enough to live on without work, and if he understands farming and likes it, I do not see why he should sell and move into the city; and if he has not, the question for him to decide is, whether he can do better at some other business. If he has doubts on this point, better stay on the farm. Put up a small tenant house. This is far cheaper and better than boarding men in the family. Take the general direction of the farm, keep things in order, do light work, attend to the stock. In this way a man who understands farming can often earn or save more money than he could by going into the field to plow. Farmers do not realize how much they get in the shape of house rent, fuel, fruit, vegetables, pork, lard, milk, butter, eggs, etc. Everything is now so high that people of moderate means have hard work to get along in the cities. If a man is on a farm

and doing well, he had better stay where he is; and if he is not doing well, let him "consider his ways," i. e., let him *sit down* and look the matter honestly in the face and ascertain where the fault lies. A little self-examination takes the conceit out of a man, and real humility is the parent of good resolutions, and leads to success.

One of the most prosperous farmers in this section was a city man—I think a painter—who saved a little money, and bought, twenty or more years ago, a piece of so-thought poor, sandy land, that the timber had all been cut from. He paid about \$500 for one hundred acres. It is now worth \$20,000. When he went on to the farm, his health was poor, and he has never been what is called a "hard-working man," but he attended closely to his business. He has a tool-house, and a place for everything, and keeps everything in its place. Everything in and around the house and barns is as neat as a pin, and order and system pervade all his operations. It was thought when he bought the land that it was "barren." He found, however, that it would grow clover, and in this case, as in so many others, plowing under clover made the land rich enough to produce anything he liked to sow or plant. I need hardly say he had a good wife,—one that interested herself in farming operations, and was not continually longing to get back to the city.

I never understood, till the other day, why farmers on hilly land do not irrigate their meadows. I was walking over a farm on the borders of Cayuga Lake. There was a little stream running through it. "For fifty dollars," I said, "that stream might be made to irrigate ten acres of land." "That is true," replied the owner of the farm, "but when you want to irrigate, the water is not there; it dries up in the summer." "That is of no consequence," I replied, "it is here now, and the early spring and late fall is the time to irrigate in this country." On further conversation it appeared that he thought the object of irrigation was to furnish water to the plants during dry weather. And he believed this was the common opinion. If so, it accounts for the fact that so few farmers adopt the practice, even when the land might be flooded at a mere nominal expense. Of course, streams which dry up will only make "catch meadows," but even in cases where you can only flood the land for a week or ten days in spring, the benefit is very great. It will give you a good bite of grass three weeks or a month earlier than where it is not irrigated; and in a spring like this, when if a man had had good grass butter in April, he could have got 75 cents a pound for it, early feed is a great object. Those who raise early lambs for the butcher can also appreciate the importance of such food for the ewes.

It is a great mistake to keep a poor horse. I have one that has been on this farm, or some other, for about twenty-five years. He has been a good horse in his day, and I can hardly make up my mind to give him half a pound of laurel, and let him rest from his labors. And yet I am sure I could not invest a dollar to better advantage. He eats just as much as one that does more than double the work. It costs at least one hundred dollars a year to keep a horse, and it is far better to pay four or five hundred dollars for a good team than take a poor one for nothing. Man and team, counting shoeing, harness, etc., cost about \$500 a year. And who does not know that a good team will do from one-third to one-half more than a poor one?

Farmers, as a general rule, keep too many

horses. In old times, when hay was worth only \$5.00 a ton, and oats 25 cents a bushel, it might pay better to keep an extra team than to hire an extra man. But who can now afford to let a team lie idle, while the teamster is hoeing corn or planting potatoes? With proper management the requisite number of horses can be profitably employed on the farm throughout the season. Of course, it is sometimes well to let a horse run to pasture a few weeks, but that is another question. To let him lie idle merely because you want the teamster to do work that another man could be hired to do for \$1.50 a day, is poor economy. Ellwanger & Barry, who study these matters closely, say each team and man costs them \$4 a day.

There are few things which annoy me more than being obliged in cultivating corn or potatoes to go twice in a row. A strong horse and a good steel-tooth cultivator will do *almost* all the work as well going through the row the first time, as by coming back in the same row. All that one gains is in being able, when the rows are not absolutely straight, to get nearer the hills of corn. The same object, however, might be attained by going only once in a row, and keeping the cultivator the first time through, close to the right hand hills, and the second time through, a few days later, to the left hand. Or, what would be better still, keep always to the right hand, but commence the second time through at the top of the field, instead of the bottom. In this way the cultivator would run the second time, in the opposite direction from the first. In this way the hills can be "dressed out" just as well as by going twice in a row, and the land gets an extra cultivating, or what is equivalent to it. I do not know that I make myself understood. The object of cultivating is to kill weeds, and enrich the land by exposing the particles of the soil to the atmosphere. Now no one will contend, that if we should run a cultivator up and down the row eight times in one day, it would kill as many weeds or expose as many different particles of the soil to the atmosphere, as if we cultivated the land eight times, once a week for two months. We should cultivate just as much in the one case as the other, but the effect would be very different. If only a day apart, or even half a day, so far as enriching the land is concerned, two cultivations are better than one, twice in a row.

Do I think it would pay to cultivate corn once a week for two months? I am sure it does on my land, especially if in making up the estimate the following crop is taken into consideration.

More About Beans.

After the article on Bean Culture which appeared in the last number, was in type, we received a communication from a farmer in whose judgment we place great confidence, from which we extract the following:

"With a good yield the price may be very low next winter. We have known beans sold for 75 cents a bushel, that would now bring \$5.00. At \$2.00 a bushel, beans are a profitable crop to raise. They are planted after all other spring work is done, and gathered in time to permit the land to be sown to winter wheat. If the land is in good condition and the crop is kept scrupulously clean, twenty bushels per acre may be expected in an ordinary season, and thirty bushels if the season is favorable.

The impression that beans do best on poor

land is a mistake. When the country was new and the land rich, there may have been some truth in this idea, but that time is past. On dry upland (and beans should be planted on no other) it is rare, indeed, to find soil that is too rich. The crop has such a short season to grow in that it is essential to have an abundance of plant-food immediately available and within easy reach of the roots. Another mistake, equally common, is in not keeping the land clean. We know a farmer who planted five acres of beans. He hoed half an acre, and then, other work pressing, gave up the job. The weeds soon smothered the crop, and he had more beans from the half acre that was hoed than from all the rest of the field. We have seen a twenty-acre field of beans so full of weeds that in the latter part of July not a single bean could be seen from the road. They were there, however, and were finally harvested, and bringing a high price, paid a fair profit. Had they been properly cultivated and hoed, they would have almost paid for the land. As it was, the farmer said he should raise no more beans because 'it was such an awful job to pull them.' To pull beans from among thistles is, indeed, unpleasant work, but that is not the fault of the beans. On clean land, beans can be pulled for \$1.50 to \$2.00 per acre.

Beans are generally planted on sod ground. But if the land is clean they do equally well on corn stubble or other plowed land. Some of the best crops we have ever seen were grown by nurserymen on land that had been cultivated for several years with young trees. A good rotation is to plow up an old sod, plant corn, and the next year plant beans, and then wheat. If the corn is heavily manured and thoroughly cultivated, the land will be in good order for beans. If it can be plowed early in the spring and again just before planting, say the first week in June, and the beans are cultivated once a week for a month, and once or twice afterwards, the land will be as clean and the wheat nearly as good as if summer-fallowed. When beans are raised on an extensive scale, they are sown with a drill. There are several excellent bean planters that do the work expeditiously and well. The drills are about thirty inches apart, and the seed is dropped in hills a foot apart in the rows, with four or five beans in a hill. It takes a bushel or a bushel and a half to the acre, according to the size of the beans."

Cotton Seed Meal for Feeding.

Cotton seed cake meal, now to be found in our markets, is the residue left after pressing the oil from the cotton seed, ground for feed. The cotton seed as it comes from the gins, is covered with a hull or shell, which in the upland variety is clothed with a short down of cotton fiber. The seed makes more and better oil, and better feed, if it is deprived of this hull; nevertheless, there is, or has been, considerable seed pressed which has not been thus decorticated. There are several patented processes for this hulling or decortication. After pressing, the cake is ground for feed as we find it, and sold at considerably lower prices than those of linseed cake and meal. Its actual value for feeding purposes is considerably higher. Prof. S. W. Johnson, in a report made to the Connecticut State Agricultural Society in 1877, says: "Cotton seed cake is much richer in oil and albuminous matters than the linseed cake. Three pounds of the cotton seed cake are equivalent to four of linseed cake of average quality. The value of the

article as a manure is obviously very considerable. The dung of cattle fed upon it will be greatly richer, both in nitrogen and phosphates, than that of animals fed on hay alone. Where stock is kept, probably the best manner of using this cake as a fertilizer is to feed it to the cattle, and carefully apply the manure they furnish. In this way, whatever is not economized as fat or flesh will be available as manure."

We have tested in the manger the soundness of these views from the laboratory, and have no doubt of their correctness. We overcame a prejudice in using the meal for feeding milch cows, and found it a very valuable article. All animals will not eat it at first. If it is not relished at once, it may be mixed in small quantities with corn meal, and sprinkled with it over cut feed. The most reluctant animal will soon come to eat it greedily. We would use the meal in connection with both roots and hay in the winter, feeding not more than four quarts a day. It is said to be dangerous to feed it to young calves while living in part upon milk. There are well-attested cases upon record of its having killed them. Whether this was owing to some defect in the preparation of the meal, we are not able to say. It is well for stock raisers to be cautious. It is a safe article for cows, increases the flow of milk, and keeps them in good condition. It stands at the head of all kinds of fodder in producing manure rich in nitrogen. As the value of manure depends mainly upon the food from which it is made, farmers ought to look a good deal more sharply at this matter than they have been accustomed to.

Sod Fences—Their Utility.

The sod fences of Ireland are famous,—and the hedge and ditch are met with throughout England. The moist nature of the climate has much to do with the maintenance of these fences in permanence and beauty. In this country sod fences will last many years in moist ground, but severe drouths will brown them, frosts will crack them where the grass dies out, and weeds will be found, we fear, in many places more hardy than grass. Nevertheless, sod fences have their uses with us. There is no better way of putting a fence across a swamp; sheep will go over them with ease, but they should never be pastured in low, wet land. Where there is a great scarcity of timber they may be used to advantage; and made broad on the top and surmounted by a hedge of thorn locust, even sheep will not pass them. In response to a request published a few months since, Mr. A. J. Sanborn, of Ogle Co., Ill., sends the *Agriculturist* an account of his experience, as follows:

"I have been a resident of Illinois for twenty-eight years and have helped build some sod fence, and have seen a good deal more built by

tion of the ditches and wall.] First a row of sods is set six inches from the edge of the ditch on each side, being backed with earth, to hold them in place. Then fill in between, and when the filling is high enough, lay another row of sods. When it is done, the wall will (or should) be five feet on the base, three feet high, measured on the slope, and three feet across the top. Each ditch will be three feet wide at the top, one

FIG. 2.—SOD FENCE.

foot wide at the bottom, and two and a half feet in perpendicular depth. Such a fence will last a good many years, and is the nicest place for lambs to play upon I ever saw, and the greatest nuisance that ever was in a neighborhood."

"J. McL., of Bergen Co., N. J., says that an excellent and lasting fence may be made as follows: (Figure 2 shows this plan in section.) "If a wall three feet high is required, which is equal to a fence five feet high, stake out lines five feet wide for the wall, and four feet for the ditch. First cut all the sods four inches wide where the ditch is to be, for a rod in length, and lay them where the wall will be made. Then lay them up on each side like brick, breaking joints, and at the same time filling in behind and between the two rows, or successive layers of sods. The earth must be trodden and pounded hard, and the sods settled firmly to their place by strong raps with the broad side of the spade. The sides must slope at such an angle that the wall will be three feet wide at the top. When the sods are all used up, more must be pared from the meadows adjacent, and the wall thus raised to the desired height. There will be plenty of earth in the ditch to make the wall. The top should be left flat, so that the rain will soak in, and if the filling settles, as it probably will, more earth may be taken from the ditch to fill it up level. If laid solid it will not give much, and the sods may be fastened by pins a foot long, cut from brush, as shown in the section."

The Cotton Moth.

In the *American Agriculturist* for December last, appeared a valuable article from "T. A." of Washington Co., Texas, on the Cotton Moth. One or two errors crept into it, and in pointing them out the author mentions some other valuable facts. In the beginning of the article the entomologist SAY is called Jay, and in the last paragraph, where the author advocates the use of Cresylic soap "in solution, for the prevention of the ravages of the cotton worm," and reports the results of some experiments which Mr. A. urged planters to make, it should read: "Many did so (experimented), but with a simple watery mixture of crude carbolic acid. And almost every experimenter made the same report, 'If the mixture is used in sufficient strength to kill the worm it also destroys the leaf of the plant.'" "As printed," Mr. A. says, "it makes me do great injustice to the valuable compound I used; which will not destroy the leaf, if used in such

solution as can be distributed over the plant. I find not more than two per cent of the acid will combine with water, so that, when applied to plants, (and so it is with petroleum), the water runs off the glossy surface of the leaf; but the acid adheres to the leaf, in its full strength, and destroys it. The solution of the saponaceous compound (cresylic soap) clings to the leaf.

"In confirmation of my belief as to the hyperbation of this insect, I found a healthy, active moth in an enclosed gallery of my house, about ten days ago, after several killing frosts.

"We are having a trying winter on stock, and thousands upon thousands are dying. No hay or rough feed, of any amount, was saved last fall, except by white labor. And with everything devolving upon us, the quantity saved was very limited. The *Migratory Locusts*, of which I sent specimens, ate up a great part of the green pasture. The 'Prickley Mesquit' of Texas alone escaped, and that only partially. Of the myriads of eggs deposited—and of which, too, you had specimens—I cannot now find a trace. Destroyed, I think, by the severe freezes. Sheep have suffered greatly—the more as they are all more or less fearfully infested with scab and other insects."

Wolf-teeth in Horses.

We notice occasionally in agricultural papers, and find not infrequent mention in our correspondence, something about wolf-teeth as affecting the sight of horses. This is an ancient prejudice and entirely without foundation in fact. The name wolf-teeth is given to small, supernumerary teeth, which occur occasionally

WOLF-TEETH.

in the mouths of horses, and are situated commonly in the upper jaw, but sometimes in the lower, as shown in the accompanying figure, just in front of the first grinding tooth. They are most usually noticed in the mouths of colts, and when the permanent teeth come are almost invariably crowded out, and thus shed are not renewed. Sometimes the root of one of the milk teeth is not absorbed properly, but crowded inward, where it remains, and is called also a wolf-tooth. This may cause the horse considerable inconvenience. A third application of the name is to points or edges of teeth not ground off by the action of the teeth upon each other in chewing and biting, when these points become so long or sharp as to cut the tongue or lips. It is an absurd prejudice, (for which, however, the ancients are responsible), that attributes diseases of the eye to the supernumerary teeth above mentioned. There is not the least foundation for such a view. The wolf-teeth may remain, or they may be taken out without fear of any evil influence upon the sight of the animal. If not shed they may be a nuisance, and are always a deformity, and may very properly be removed. This is easily done by an oak pin of convenient shape placed against the tooth and struck a smart blow with a mallet. The sharp angles or edges caused by unequal grinding are

FIG. 1.—SOD FENCE.

others. The best is made in this way: The ground is laid off twelve feet wide, with a strip six feet wide in the centre. The sods are cut with a spade from the three-foot strips on each side so that they will match and make a facing for the bank or fence. [Fig. 1 represents a sec-

best filed away. The engraving represents the lower jaw of a yearling colt, showing a rather large wolf-tooth in front of the first molar.

Quaker Practice on Canada Thistles.

Mr. Truman Mabbett, of Vineland, N. J., has too much pluck to run before even Canada Thistles, and in accordance with his Quaker principles he is averse to a fight. [We don't know who does not object to a hand-to-hand conflict with this weed]. Nevertheless he sends the *Agriculturist* a sketch of an instrument of death

MABBETT'S THISTLE PULLER.

to Canada Thistles, which, faithfully used, will, we doubt not, exterminate the pest. He writes: "I send you a drawing of a pair of long-handled wooden pincers, that any one handy with tools can make. This is to be used to pull up the sprouts which come up after mowing off the thistles just before they are in flower. This should be done either just before a shower or during a rain, in order to let rain run into the hollow stems and rot the root. In my case this instrument proved most satisfactory. I was living in Saratoga Co., N. Y., and bought a piece of good meadow land cheaply, because it was completely covered with Canada thistles. I mowed and pulled, as above described, for two years; and the third year, this land, being then quite free from thistles, made one of my finest meadows. I have now found the pincers to answer another good purpose on my Jersey five acres—that is, in pulling blackberry sprouts, when it is desirable to preserve the rows in regular lines. The handles being long, one can use the implement when standing erect. The total length of the pincers is thirty inches; the width of the jaws three inches; length of the same, eight inches. The pulling is more easily done after a rain, when the soil is moist, than at any other time."

Gang Plows and Sulky Cultivators.

Gang Plows are properly two or more plows united, or combined in one implement, to be drawn by one team or engine. The advantages offered by such combinations of plows are several, the principal of which probably is that a good driver is all the plowman and driver needed for two or three plows. Practically as things shape themselves in actual use, two plows, where deep plowing or sod breaking is to be done, are all that can be economically used, and when more than two are used they must be so light as to approximate to cultivator teeth, and the work performed would ordinarily be better done were a larger number of cultivator teeth substituted. Gang plows and sulky cultivators are therefore natural modifications of the same implement, and there are several in market, both at the East and at the West, recently brought out, yet having had several seasons' trial, which commend themselves to

agriculturists. Their desirable qualities are so obvious, if they are good for anything, that it has not been necessary to "push" and "pull" them in order to secure their introduction. But, as the number increases, there will be, of course, great efforts made to establish claims to superiority. These we do not attempt to decide, but most heartily commend the principle upon which they are constructed, as eminently useful in saving labor, both in simple plowing and in hoeing corn and other crops. In the lightest work done by them, as in hoeing corn, two horses are necessary, for the implements are driven astride the rows. In the culture of corn, potatoes, sorghum, sugar cane, cotton, and all crops planted in hills and rows, far enough apart for two horses to be used, and which require hand or horse tillage, a vast amount of labor may be saved by the Sulky Cultivator. In buying, select one which has little machinery, which is strong, but not heavy, which may be easily repaired if broken, and in which the plows or teeth may be easily changed. The

driver's seat must be easy and secure, and the feet should do a good part of the work of elevating the plows over obstacles, depressing, etc.

Whiffletree "Boot" for Plowing Orchards.

The benefit an orchard may receive from the tillage is often offset by the damage done by the careless plowing of a heedless plowman, so the labor may as well be spared. But it is not necessary to injure the trees. The old plan of slipping old boots over the outer ends of the whiffletrees answered a tolerable purpose; but a better plan is communicated to the readers of the *Agriculturist*, by Mr. Henry Körner, of Belmont Co., O. It consists of a strong piece of harness leather, wide enough to fold over the end of the whiffletree, (which should be square on the end) and extend along the chain trace, gradually tapering until it terminates in a strap, by which it is attached to the

WHIFFLETREE BOOT.

trace. The broad end is fastened to the whiffletree by a short strap buttoning over a screw head. We know no better name to give this tree protector than whiffletree boot. Mr. K. thinks rubber (such as worn-out pieces of belting, we presume) might be better than leather.

AVERAGE PRODUCTION OF CROPS IN NEW YORK AND IN GREAT BRITAIN.—The average production of wheat in 1865 in N. Y. State was 13.36 bushels to the acre, in Great Britain, the estimated average for 1867 was 24.4; of oats, 17.16 bushels to the acre, in Great Britain, 41.2; barley, 16.27 bushels to the acre, in Great Britain, 33.7; showing very nearly twice the product in Great Britain of all these cereals. The comparison of the root crops is quite as favora-

ble to England. Yet the soil and climate of New York are as well suited for all these crops, with the exception, perhaps, of turnips. The difference is mainly one of cultivation. With as much skill and capital invested in our farming we can show quite as good results. The English farmer, as a rule, does not own his land, but has a much larger capital invested in stock, tools, fertilizers, and labor. He manures liberally, and cultivates thoroughly, and gets his reward. If one who hires the land can afford to go to this expense, we who own our farms can much better afford it. The English average yield has been increasing for years; ours is decreasing. Is it not about time to farm more thoroughly, and turn the tables?

HENS' NESTS.—Among the numerous handy contrivances which Mr. J. H. Mabbett, of Jersey City, has in his very complete hen-house, are

Figs. 1 and 2.—HENS' NESTS.

his box nests, of which we made a sketch and present an engraving. These boxes are made of three-quarter inch boards, planed, and measure 12+12+15 inches, the measure from front to rear being greatest. They may be made with both bottoms and tops, if desirable, but it is better to use one box as the cover for another, or to cover one course of boxes with a wide board, which will form an alighting shelf for nest boxes set upon it. The square end presented to the front has a pear-shaped hole sawed in it, widest at the bottom. This remains open, but the piece which comes out of it is fastened by a screw in its small end, so as to form a lid to a hand-hole in the back end, as shown in fig. 2. These boxes may be arranged in three or four courses, and by alighting shelves and ladder made entirely accessible to fowls, while the eggs may be removed from the rear without disturbing the hens. Sitting hens may have eggs put under them, and by turning the nest box around they will be safe from the annoyance of others.

Harvesting Barley.

There is more than one good way to do a great many things, and circumstances alter cases in times and ways without number. It is impossible to advise positively in regard to what is absolutely the best way to conduct even simple farming operations everywhere. Hence no agricultural paper is an infallible guide for every body, in matters of practice, however excellent and practical its teachings. A correspondent who believes in doing things both well and cheaply, writes out clearly his way of harvesting barley. Referring to the article on barley culture in the April number of the *Agriculturist* he says: "I most heartily agree with the writer until he arrives at harvesting. He says: 'In harvesting, the crop is cut with a reaper, and it is better to bind it into sheaves.' It may be better to bind and even shock as we do wheat, but it costs too much. My plan for harvesting barley, is this: I set my machine as for harvesting wheat, taking off the table or platform upon which the grain falls, thus letting it fall upon the ground. I proceed to cut down my piece the same as grass, except the machine being set in the manner described, the stubble is left per-

haps four or five inches high, thus allowing the knives to pass over ordinary stones and clods. Barley cut in this way—and I may say in whatever way—should be cut while quite green, and no loss will be sustained by the team walking over it. The grain being thus evenly spread over the ground, a few hours' sun is sufficient to cure it for the horse-rake, which is here put in, with hands to put up in cock. Barley well put up, cut in this way, will shed rain much better than barley thrown from the machine in bunches, and put up in like form. The first season that I cut barley in this way, my neighbor over the way cut his, and threw it off in bunches. Mine was soon cured and put up; his being in bunches, did not cure before it rained. He had to turn it all over, and before it was dry it rained again. Again it had to be turned, and at last it was put up. When we came to thrash, his barley was all badly stained, while mine was nearly all bright. My barley was harvested with half the labor of his, and the straw, as well as the grain, much better. He was not slow to see, nor will the many readers of the *Agriculturist*, if they once try it, that my plan for harvesting barley is the best."

Florida as a Home for Northern Men.

Florida is attracting a fair share of northern emigration, and the tide will run hitherwards much stronger, as its merits are better understood. Previous to the war it had been little known to northern men, except as a resort for invalids in the winter. The war led a great many of our soldiers to pass the summer there, and afforded opportunities to become well acquainted with its soil, climate, and productions. It is not all swamp and sand, but has a good variety of soil, much of it fertile, and well-adapted to the crops of the Gulf States, and also to semi-tropical fruits. The climate is asserted by residents to be one of the healthiest, if not the most healthy, of all the States, and they bring statistics to prove it. This is probably true of the hammocks, and of the sandy portions, which contain the great bulk of the population. The temperature is quite uniform, and without the extreme and sudden changes, which make the seaboard Northern States so disagreeable, especially in the spring. Beside the staple crops of the South—cotton, tobacco, corn, sugar, and rice—it will produce, in the southern part, the pine-apple, banana, and plantain, and in all parts, the lemon and orange. The orange grows wild in the greatest luxuriance and health, and it is quite rare that a winter occurs so severe as to injure the trees. These wild trees make excellent stocks for the orange of commerce, and they only need grafting and cultivation, to produce fruit of the best quality, and in any desired quantity. Our northern men, and many of the natives, disappointed with their cotton planting, are now turning their attention to orange orchards, in which there is every prospect of success. We hear of this kind of enterprise in all parts of the State. Almost every landholder on the St. John has planted trees this winter; some by the dozen, and others by the thousand. At St. Augustine there are large plantations of young trees. In the interior, and on the Gulf shore, they are very busily planting, meaning to supply the Gulf States with this fruit in a few years. On Lake Griffin, a northern man has made a grove of 4,500 trees, by cleaning up a "hammock" of forty acres. The largest grove in the State, now in bearing condition, is on Indian River, and con-

tains about 1500 trees. This is known all through the State as "Dummit's Grove." There is no doubt of the success of this fruit, or of the financial success of any man of good business capacity and horticultural tastes, who will turn his attention to this industry. Almost all physical wants are easily supplied. Land is cheap, and stock need no shelter the year round. The Southern army for a long time drew a large part of its supplies of beef from this State. Pigs and poultry are at every man's door, and require little attention. With its climate and soil, Florida should supply us with most of our tropical fruits, and much other tropical produce. Coffee, tea, arrow-root, guavas, bananas, pine-apples, and cocoa-nuts, have all been grown within the State, with success, and probably only need fostering, to become established and staple crops. In our great seaboard cities, oranges, lemons, and bananas, are almost as cheap as apples. Florida can produce these and other tropical fruits in such abundance as to increase their consumption tenfold, and make them cheap the year round, in all our large towns and villages. This would be a great means of health to our meat-eating population, and Florida would be enriched by this addition to her industries. We wish the largest success to the emigrants to the State and the fruit planters.

Town and Local Agricultural Societies.

Local Agricultural Clubs, we believe, are quite largely on the increase. There are good reasons for the establishment of these societies. They do not, of necessity, and should never interfere with the County and State Societies. The local society has a good work to do in bringing together neighbors with their products. There can be no doubt that a much larger number will become interested in improved husbandry through these than through the larger societies. Meetings and exhibitions should be arranged for different seasons, not for the autumn alone. Spring exhibitions for the sale and exchange of seeds would be productive of much good. Sheep-shearing festivals, milking trials, implement tests, and other meetings, might be occasions of great utility and interest. A full exhibition at the town center will draw out a full representation of everything within the borders of the town. Men who have fine cattle can take them to the exhibition without much exposure of the animals, or much pecuniary loss. They may also be brought back to their own quarters at night. These town fairs usually draw out a very good representation of all farm products, and it is not improbable that they may gradually work into periodical markets for the exchange and sale of grain, stock, fruits, vegetables, etc. Such fairs are of very great advantage in England, and we can see no good reason why they would not make a great saving of time in the exchange of products, prevent speculation, regulate prices, give the farmer a fairer reward for his labor, and make provisions cheaper to the consumers.

Butter a Great Source of Income.

In the report of the N. Y. State Agricultural Society for 1866, it is stated that the amount of butter produced in the State in 1855 was 90 millions of pounds in round numbers, and in 1865, 84 millions of pounds, showing a falling off of 6 millions of pounds. The cheese produced in 1855 was 38 millions of pounds, and in 1865, 72 millions, showing an increase of 34

millions, or nearly doubling in ten years. The milk sold increased in the same time from 20 millions of gallons to 29 millions. While there has been a very large increase in the production of the dairy districts, a much larger portion of the milk is sold in the cities and villages, and a still larger proportion is manufactured into cheese. This process has been going on in Ohio and probably in all the dairy States, though perhaps not in so marked degree. These figures furnish an important hint to those who are going into the dairy business. It is evident that we want more butter, and that for some years to come it will pay better than any other dairy product, except in the immediate vicinity of cities and villages. Do we not need butter factories now more than cheese factories? They are already started in Orange County, New York, and there is abundant room for more.

Commercial and Home-made Superphosphate.

Superphosphate should contain at least 10 per cent of soluble phosphoric acid, and if it be really "improved" or "nitrogenized," it should have 3 or more per cent of ammonia. An "ammoniated" superphosphate, examined by Prof. Johnson, contained 25½ per cent of phosphoric acid, (of which 2½ per cent was soluble) and 3½ per cent of ammonia, the calculated value being \$25.00 per ton. Another superphosphate was about equal to it, showing a value of \$24.00. One showed 10½ per cent of phosphoric acid, only 1 per cent of which was soluble in water. Its ammonia was 3½ per cent, and its estimated value \$16.50 per ton. Another was estimated at \$16.20 per ton, and the most famous, or rather infamous, brand then in use was shown to be worth \$41.00 per ton less than the price. We are confident that a very much worse state of things exists at present—having positive knowledge of articles sold at high prices which are not worth carting two miles. The manufacturers of these commercial manures ought to procure analyses of them from some well-known chemist in whom the public have entire confidence, and warrant their manures to be fully equal to the analysis. We who want fertilizers would then know what we were buying, and in case of fraud we should have our remedy. If this were done and the fertilizer were sold at a fair profit, there would be no occasion to make the article at home, for it can be made much cheaper upon a large scale.

Prof. Johnson gives the following directions for making superphosphate from Sombrero guano, and we believe them to be equally applicable to the best qualities of Baker's or Jarvis' Island guano, which is an article now in market: "The materials are 125 lbs. Sombrero guano; 32 lbs., or 2 gals., 1 qt. oil of vitriol; 16 lbs., or 2 gals. of water. The oil of vitriol may be weighed out, or, if this be not convenient, it may be measured out in a common 3 gallon earthen pickle-jar, which is converted into a measure by first filling into it two gallons and one quart of water, and making a deep scratch on the inside at the surface of the water.

"The oil of vitriol and the water being measured off are now to be mixed. This is done by pouring the acid in a slow stream into the water, with constant stirring. Never pour the water upon the acid. In this operation earthen vessels are the best, but a tight wooden vessel may also be employed. The mixture becomes very hot and blackens wood. Care should be taken to avoid spilling the acid upon the clothes or flesh. It is

better to transfer it by a ladle made of stout sheet lead or earthen ware than to pour it.

"The diluted acid being ready, it is to be used while hot. Half the contents of a bag of Sombrero guano is placed in a heap, and the acid ladled upon it, and at the same time intermixed with the help of a wooden stirrer. In this way a pasty mass is obtained, and with a little care, this one-half the guano will absorb the whole of the acid. After the mixture is completed, the remainder of the guano is sprinkled in, with thorough stirring, and in a short time the mass may be thrown out thinly upon a floor, and after standing a day or so, it will be a finished superphosphate, dry and fine, and ready for broadcast or drill sowing. On the large scale my detail of methods and results may doubtless be varied somewhat. A few trials will establish the right method."

If one wishes to make an ammoniated article, fish guano is the cheapest source of ammonia to add to the superphosphate. There is a fine-ground and dried fish guano, which contains ten per cent of ammonia, or its equivalent in readily available nitrogenous matter. Six hundred pounds of this guano added to 1400 of the superphosphate prepared according to the above directions would give three per cent of ammonia.

Stay on the Farm.

The cities and villages are already overcrowded, and every kind of business languishes more than the cultivation of the earth. In the cities the labor market is overstocked, and one can get any desired number of hands for any conceivable job. Clerks from the country have usually to serve two or three years before they can get living wages. The city throngs with unemployed men and women, waiting for something to turn up. Those who find employment have no security for permanence. Mechanics lose their places and have to lie idle for weeks and months together. All the products of skill and labor are relatively cheaper than provisions and breadstuffs. The great material want of the nation is cheaper meats, grain, and vegetables. We have merchants, mechanics, and middlemen enough, but far too few farmers. The best cultivated State abounds in uncultivated lands. Even in the vicinity of our large towns and cities, cheap lands abound, and splendid chances for enterprising young men to win homes and fortune. Once settled upon his own acres, the farmer has constant, profitable occupation before him. Nowhere is unskilled labor so sure of sustenance, nowhere will intelligent industry so surely win a happy home and competence. In the country one never need to lack labor, and labor brings there the necessities and comforts of life.

Breaking Prairie.

Wild prairie sod is very different from any green sward Eastern men are accustomed to see. It consists of the old and new, tough, dried, and decayed stems and foliage of many plants—many of which, indeed, are grasses, but in many places they hardly constitute the majority. There are weeds with roots as large as a man's arm, tangled vines, tough, low-growing shrubs, and plants of many kinds from mosses to scrub-oaks. In breaking up such a mass of materials, all well matted together, it is no wonder that farmers easily argued themselves into the belief that shallow breaking is best. It kills the weeds, and the sod rots, and it is ready for a crop the

next spring. A few years ago this subject was discussed in the *Agriculturist*, and a question was lately proposed to our readers, to draw out, if possible, new views. Three responses are selected, as showing the views of intelligent farmers. A Missouri farmer, "C. W. II.," writes:

"After several years' experience in the cultivation of prairie lands in Missouri, I am convinced that the best plan for breaking wild prairie land is to begin plowing in the spring as soon as the ground is settled. Use a team sufficient to break the sod three or four inches deep, and follow the breaking team with a good two-horse team, and plow, throwing the subsoil on top of the sod, covering it nicely with loose earth, making a first-rate soil to sow spring wheat, oats, or any early grain or grass. It may lie until May 1st; then plant corn or vegetables, and you may expect a good crop with little labor. The land will be in splendid condition for a crop next season. I have seen 40 bushels of corn to the acre raised on ground prepared as above, without any more work, when others raised little more than seed, planted in the common way. I have also seen osage hedge grown from the seed from three to four feet high, in one year, on land prepared as above, without any cultivation. Land so prepared is excellent for fall wheat. The advantages of thus preparing prairie are so obvious that details are unnecessary."

Lewis Benedict, Grant Co., Wis., after an experience of 17 years, says: "Commence breaking prairie as soon as the grass starts in the spring sufficient for stock to get their living, and break what you can until harvest—that is, in this latitude about the 15th or 20th of July—and what cannot be turned over by that time should lie until the next season. I tried breaking a part of a land after harvest that I had not time to finish before, and did not get half a crop the first or second year, and could see a plain difference in the crops six years after. It is best to break from 1½ to 2½ inches. I have found the thinner the better; tried several depths from 1½ inches to 8, and found the shallow breaking always the best. The turf rots much sooner, and brings better wheat. With deep breaking, the ground seems cold and lifeless, somewhat resembling fall breaking. After the first year, plow one inch deeper every year until a desirable depth is reached. In this section wheat is the most reliable crop to put in. Sow the next spring early—the earlier the better."

An Illinois farmer thus gives the result of his long experience: "The best time to break prairie is in June, but it will answer from about the middle of May to the middle of July, or at any time after the grass has got a good start, and before it has got its growth, for before that period the roots are more readily killed, and the sod rots much quicker. Break just as shallow as it can be done, and have all the sod cut up, say from one to two inches. If the ground is smooth enough to break as shallow as one inch, it is all the better. The main object in breaking up prairie is to subdue the sod in the most perfect manner in the shortest time. If it is broken deep, sufficient moisture is retained in the sod to keep the roots alive; these will turn and grow through the sod, requiring years to subdue them; but in shallow breaking the roots are all killed, and by September sufficiently rotted to harrow to pieces. The next plowing should be two or three inches deeper than it is broken, plowing the same way. If the locality is favorable for winter wheat, it will probably be the most profitable crop to put in. It should be sown in September, say from the 1st to the 10th, and thoroughly harrowed in (not

plowed). If the locality is not suitable for winter wheat, corn will probably be the best to put in for the main crop; but a small return must be expected, though sometimes a remunerative crop is obtained, as it requires no attention after planting until it is gathered. Potatoes often do well, as likewise pumpkins, squashes, melons, etc. Turnips generally do well. Should it be important to get as large a crop as possible the first year, the best way is to turn a double furrow, by first breaking the sod shallow, being careful to lay the sod flat and level, running the plow in the same furrow, some two or three inches deeper, thus covering the sod completely. This is an expensive way of breaking, and I think not as good for the land, as the sod is too long in rotting. The plowshare and coulter should be kept constantly sharp by filing every two or three 'rounds,' as sharp as the file will make it, to cut the perfect mat of roots below the surface. The share should be sent to the blacksmith every few days, to be drawn out thinner, thus saving the time of filing and the wear of the plow and file." W. A. S.

Summer Pruning or Pinching.

There is no one point in horticulture about which there has been more discussion than that of summer pruning, and those who advocate, and those who condemn it, stand in about the same relation as they did years ago—each the more confirmed in his own opinion. We consider it useful or injurious, according to the manner in which it is done, and the subjects upon which it is practised. To allow a tree to make vigorous shoots and then cut them away in summer, or to pinch the young shoots without any thought of the effect, so long as something is pinched, will, like all other haphazard work, be likely to result in serious injury. Summer pruning is done, in the first place, to regulate the form of the tree. Dwarf trees, especially, may be so managed by rubbing out a few needless shoots here, and stopping the growth of another there, that there need seldom be any pruning required. Nip out the growing point with the thumb and finger, and the branch will cease to elongate; but after a while the buds upon the shoot will push, and when these have made a few leaves, they must be pinched in the same manner. The growth from buds and grafts is often very vigorous; that from buds often runs up as a long, succulent wand, hardly strong enough to support itself, and with but little disposition to form side shoots. By pinching at the proper height, the buds along the sides will start, and with a little attention a low-headed, shapely tree may be had, that will not need to be cut to pieces in order to bring it into proper form when planted. Another use of pinching is to throw the tree into bearing. It is now a well-received opinion that whatever threatens the life of a tree tends to induce fruiting; hence we hear of trees being made to bear by hacking them with an axe, by root pruning, etc. When the development of the tree is arrested by pinching, it usually sets about making fruit buds, instead of leaf buds. In pinching dwarf pear trees, the shoot from the bud at the end of a branch is allowed to grow, and those starting along the sides of the branch are pinched back to three leaves. If shoots start from those that have been pinched, nip them back to two leaves. The leading shoot is shortened as may be desired, after growth is over. The formation of fruit buds upon dwarf pears and apples is hastened by pinching.

[COPYRIGHT SECURED.]

PHARAOH'S HORSES.—FROM A PAINTING BY HERRING.—*Drawn and Engraved for the American Agriculturist.*

Chariots, and horses, and horsemen, made a great impression on those who viewed the destruction of Pharaoh's host, as described by Moses, and sung by Miriam. The inspiration of the scene led to the composition of one of the grandest poems ever written or sung. This song should be read with the description which precedes it, and a feeling of sympathy with the great leader and lawgiver of Israel, if not with the discontented mob of which he was the liberator. So read, it is certainly calculated to stir the wildest enthusiasm, and might well fill an animal painter with visions of horses such as nothing else could. These three heads, from one of Herring's famous pictures, are admirable as depicting flight and consternation in the horse. A frightened horse, of which man has lost control, and which is wildly exerting his great power without other aim than to escape some real or fancied peril, and without regard to dangers which may lie before him, is a grand as well as terrible sight. Such a horse, if he survives the frantic race which he runs, after, perhaps, kicking and shaking himself free from every trammel, is never the same horse again. His experience and views of life have changed, and sights and sounds have new meanings. The bridle must be strong, the harness secure; he

must always be controlled, and never trusted implicitly. Used thus, his days of usefulness may be long—but he will never again be reliable.

The Striped Bug.

The great enemy to squash, cucumber, and all other vines of the same family, at least in their younger days, is the striped bug. The little tormenter is so well known that it need not be described. It attacks the young vines as soon as the seedling plants break through the ground, and they have truly a "struggle for existence," which does not always end in the "survival of the fittest." If the vines can be protected until they have made five or six leaves, they generally are able to endure the attacks of these insects, though not always. The importance of this enemy is shown by the variety of means that have been proposed for his destruction. Covering the vines during their early growth is the only *sure* preventive we know of, but this is applicable only on a small scale. A square, bottomless box, made of foot boards and covered with muslin or millinet, with its lower edges well pressed into the ground, will keep off the bugs. The next hand-glass advertised in March last would doubtless be still better, as it gives

more light. Mr. Gregory, the well-known squash raiser, after trying many things, relies upon plaster, or oyster-shell lime, which he considers of equal value. He objects to air-slaked stone lime, as it is apt to be too caustic, and injures the plants. The plaster or lime is applied by shaking it from a small, fine sieve, while the leaves are wet from rain or dew. The first application is made as soon as the plants show themselves, and renewed as often as washed off.

Mr. G. E. Hulse of Ulster Co., N. Y., makes a sort of "scare-crow," which he says he finds effectual. We think we have seen the same in use many years ago. He says: "Take a stick about three feet in length, fasten a string to one end of it and tie a bunch of paper to the other end of the string; place the stick in the ground, at an angle of about 45°, so that the paper will hang directly over the hill of cucumber plants, and the wind will keep the paper swinging, thus effectually frightening away the bugs. I use elder for sticks as they are easily trimmed."

C. S. Dewitt, Geneva, N. Y., writes: "I tried last year for the striped bug powdered White Hellebore, which I had bought for currant bushes, and with the very best results. My nearest neighbor had two hundred sashes of melons, and lost about 33 per cent by this pest."

The Monkey-Flower—*Mimulus*.

A species of *Mimulus* (*M. luteus*) grows all along our Pacific coast, and is also found in Chili; in its wild state it is pleasing enough but not particularly showy. So much does it vary, even in its wild state, that botanists have made several species of its different forms. It may well be supposed that a plant with such a natural tendency to vary, would, in the hands of careful florists, give rise to some marked varieties. Of late years it has received much attention, and the result has been the production of some most beautiful forms, all widely differing from the native ones. The engraving will give a good idea of the general appearance of these. They differ in the spread of the corolla, and in its texture, color, and markings. The ground color is usually some shade of yellow, which is dotted, and blotched with a rich purple or deep scarlet. The flowers even come double, with one corolla within another, as may be seen from our engraving in our Horticultural Annual for the present year; this variety, which is known in the catalogues as Bull's *Mimulus, tigrinus fl. pl.*, is said by Mr. Vick to come always true from the seed. There seems to be no end to the names, and the catalogues have *M. punctatus, speciosus, variegatus, Harlequin, tigrinus*, and the like, but all garden varieties of one species. The *Mimulus* is a perennial, which, however, seldom stands our winters, and can only with certainty be kept from year to year in the greenhouse. As it is one of those perennials that bloom the first year from the seed, it is usually classed as an annual. The seeds are very small and should be sown with care; it often comes from self-sown seed. The plants need a light, moist, and rich soil, and should be placed where they will be partially shaded from our intense midsummer sun. For pot culture the varieties of *Mimulus* are very useful, and choice varieties may be propagated by cuttings, or by division. The old Musk Plant is a species of *Mimulus*, (*M. moschatatus*), and is prized by many for the peculiar musky odor of its foliage. It is a low-growing, rather trailing plant, and needs plenty of water and shade. Its flowers are not showy. We have two native species with small purple flowers, and which are rather weedy-looking plants. They grow in moist places, and are called *Mimulus ringens* and *M. alatus*.

An Oak Scale Louse.

A gentleman residing at Orange, N. J., recently brought us a specimen of English Oak, which presented the worst case of scale that ever came under our notice. The small scale insects are not so numerous upon a given space as we have seen the oyster-shell bark-louse, noticed in April last, their effects are much more marked. Around each scale the bark has swollen in

OAK SCALE LOUSE.

such a manner as to give the whole surface a repulsive appearance, not unlike that presented by some pustular skin diseases. The scale itself is less than a line in diameter, and very nearly circular. Most of the individuals appear

shiny black to the naked eye, but dark brown under a magnifier; these contain numerous eggs, while the yellowish scales mixed with them were empty or contained only dead remains. The tree—one of several oaks purchased and planted at the same time—is completely covered in the manner we have described. The engraving gives something the appearance of the twig, but fails to convey the repulsive look.

MONKEY FLOWER—MIMULUS.

We find that Dr. Fitch has noticed some scale insects upon some of our native oaks, but we cannot make his brief description apply to the present insect. Loudon quotes the case of an oak which was cut down in the Bois de Boulogne (Paris), from the description must have been similarly affected, but the name of the insect is not given. Our advice as to this tree was to cut it down before others became infested. We are glad to see a growing attention paid to the condition of our various ornamental and forest trees, as they are quite as liable to the attacks of diseases and insects as are our fruit trees.

Preparing for the Exhibitions.

That our horticultural shows, on the whole, do a great deal of good, we do not doubt; that the system of offering prizes for the best—meaning usually the largest—specimen of this or that, without regard to the way in which it was produced, tends much to the advancement of general horticulture, we very strongly doubt. A glance at the list of prize takers will show that year after year certain persons are sure to take the prize for certain things. Those who devote themselves to growing special fruits and

flowers will, of course, attain greater perfection than the novice, but the novice does not know that the fruits, etc., which have carried off the prize that he hoped to gain were prepared long beforehand for the exhibition. Prizes are offered, and people who know how, set themselves at work to win them. It is mainly a trial between experts, and as a general thing the amateur or commercial cultivator has no chance. An

illustration of preparing for the exhibition occurred within our knowledge: two boys, 10 and 13 years old, saw the schedule of a fair, and decided to try, one for the premium on beets, and the other for that on carrots. A few plants of each were assigned to the boys; they gave them plenty of room, fed them with liquid manure, and tended them daily. The consequence was that the premiums for the "three best beets" and "three best carrots" were awarded to these boys, to the exclusion of those who had probably grown an acre or more of either, and selected the best of their produce. Now, what these boys did is what must be done by any one who competes for prizes—he must prepare for the exhibition. If it is for the "best quart of strawberries," take a row that should yield a bushel, and after the fruit has set and is large enough to show whether it is perfect, pick off all but two or three berries to a stem. Mulch the plants, water them, coax them with liquid manure, and if the berries are ripening up too soon, put up a cloth to shade them. Doubtless a quart of enormous berries will result, that will take the prize. The committee will ask no questions, perhaps not taste of the watery, flavorless monsters, but the grower will go out as the prize strawberry cultivator. If contending for the prize on squashes, grow but one squash to the vine, feed it and water it, and a prize squash will result. The prizes for Dahlias and roses, and other flowers, are obtained in a similar manner. Pot plants are often "garnished," that is, the plant, whether fruit or flower, is made to appear more prolific, by skillfully attaching branches of fruit or flowers. We mention

this practice, not to commend it, but to warn committees that it is done. So far as these decisions show what manuring, watering, thinning, and high culture generally, will do, they are in that respect well, but so far as indicating what may be done in general culture, they are useless.

The Grape Curculio.

For some years there have been occasional accounts from some parts of the West, of injury to the grape by a curculio. No full account of this insect had been given until the appearance of the excellent Report of Mr. B. D. Walsh on the Noxious Insects of Illinois. Mr. W. has studied up the insect, and we give an abstract of his account and make use of one of his figures. The perfect insect is about one-tenth of an inch long, and of the shape shown in the enlarged engraving. It is black, with short, scale-like, white hairs, which give the black a grayish tint. The wing-covers are grooved and dotted as shown in the engraving. One of the distinguishing marks of this species is the coarse tooth upon the four front shanks. For

a more detailed description we must refer to Mr. Walsh's Report. In June the beetle deposits its egg in the young grape, leaving as its mark a dark, circular dot. The larva, when hatched, feeds upon the contents of the berry, which continues, to all appearance, sound and plump. The full-grown grub is almost two-tenths of an inch long, legless, yellowish-white, with a horny, pale brownish-yellow head. Late in July, or early in August, the larva drops to the ground, or the berry containing it falls from the bunch, and it makes its way below the surface of the earth, where it undergoes its transformation, and comes out a perfect insect in September. Where the females secrete themselves until the following spring is not yet made out. The accounts of the destructiveness of this insect come from Illinois, Ohio, and Kentucky; in the last-named State sixteen acres of vines in one place have been ruined by it. As it possesses sufficient powers of flight, grape growers should be on the look-out for its appearance. Mr. Walsh states that there are several parasites that feed upon its larva, and thus seem to diminish their numbers, and recommends jarring the perfect insects from the vines and catching them upon a sheet. When alarmed, as by a slight rap upon the vine, they drop even more readily than the *Plum curculio*.

Picking and Marketing Fruits.

When the small fruits begin to ripen, horticulture affiliates with commerce, and he who has heretofore given all his thought to raising fruit must now turn his attention to disposing of it. Much of the pecuniary success depends upon the way in which the fruit reaches the market. In the Eastern markets small fruits of most kinds are sold in baskets or other packages, holding nominally a pint or a quart; while at the West, they are sent to market in trays holding a half bushel, and are measured out to the purchaser. To several inquirers as to the best box or basket for fruit, we have not replied,

PICKING STAND.

as the question is yet unsettled. It depends in a great measure upon local prejudices. Whatever package is used, it should admit of being well rounded up, so that when it reaches market it will be at least level full. A basket containing three-quarters of a pint, if it is well rounded, will be preferred by the majority of purchasers, to a full pint of fruit that does not fill the basket. Very few people have a definite idea of what a pint or a quart is, and a wide difference may be made in the capacity of baskets, without the inexperienced being able to perceive it. Until we have a law, or custom, which prescribes that fruit shall be sold by weight, the grower must observe the customs that people have made "a law unto themselves." Why cherries, currants, and grapes should sell by the pound, and strawberries, blackberries, etc., by measure, is not easy to perceive. We advocate selling by weight, but as all our people buy by measure, we must accept it. Picking of the small fruits is generally done by the piece—so much for the so-called quart. On large fruit farms, the succession of small fruits,

beginning with strawberries and ending with blackberries, furnishes employment for at least three months. We know of some establishments where the pickers are employed by the day, but this is where there is a class of women who are willing to do hoeing and other field work, and may be considered exceptional. The work is mainly done by women and girls, though boys and feeble men sometimes take a part. In fruit communities it is not considered "degrading" for any one, whatever his pretensions, to go into the field. And why should it be anywhere? A shanty or tent is put up in the field, as the headquarters of the "boss," and to shelter the fruit from the sun. The empty baskets are delivered from here and are received here when filled. Each picker has a stand like that shown in the engraving. It is made of the proper size to hold twelve baskets; besides these the picker usually takes as many more as she can bring back in her hand when filled. Each picker has her row assigned to her, and she is expected to pick it clean. A foreman passes along the rows occasionally to see that the work is properly done. The fruit is to be picked with the hull on, and the stem must be broken without injuring any fruit yet unripe. The fruit is to be assorted as it is picked, and all of under size or defective shape to be put into baskets by itself. When the picker returns with full baskets to headquarters, she is credited with the number of them on a check list, or receives tickets for them, according to custom. The one who receives the fruit puts the baskets into the crates, placing the poorer fruit in a crate by itself, to sell as second rate. The overseer of the whole work must see that no part is slighted, the fruit must be properly assorted, picked clean, and the baskets properly rounded. Sometimes the fruit is picked in trays and afterwards assorted and put into baskets; but this is an old way, and is not advisable, as it requires the fruit to be handled twice. Picking should not commence until the dew is off, and the fruit after being gathered should be sheltered from the heat of the sun as soon as possible. It should be so arranged that the picking of one day shall reach the market the next morning. This, of course, often requires night work, and there should be a sufficient force to carry out every part with promptness. All crates and packages should be plainly marked with the name of the owner, and, if forwarded by public conveyance, both that of the owner and consignee should be placed on the package. Baskets rounded full and a little pressed will reach their destination in better condition than those merely level full, where the berries have a chance to rattle by jolting.

Supports for Climbing Plants.

Annual climbing plants are general favorites; their graceful forms and often brilliant flowers add much to the beauty of a garden. They are a little more troublesome than other annuals, as some kind of support must be provided for them. At the iron-work stores various kinds of wire trellises are sold, but these are generally too expensive for most persons, and are too formal in design for any but highly kept grounds. A very common support is to plant a central pole, from the top of which are fastened numerous strings which at their other ends are attached to pegs driven in the ground in a circle, making a tall cone. The objection to

this is its formality, and that the vines become crowded above, just where they should have the most room. This seems to be the best way of growing the cypress vine, but for more robust climbers we do not like it. The support that pleases us best, as it gives the climbers a chance to follow their own sweet will, and arrange themselves in graceful and picturesque forms, is made from a young tree well furnished with branches. Cedar is best, but any other of the proper form will do, if the portion that goes into the ground be dipped in gas-tar, or solution of blue vitriol. Cut the limbs back to such a length as fancy may dictate, only avoid making the support top-heavy. Whatever support is used, it must be set firmly in the ground. It should not be forgotten that the

SUPPORT FOR CLIMBERS.

mass of vines that will cover it will offer a broad surface to the wind, and if not firmly set, the whole will be apt to go over when the vines are just in their prime. Trellises for such low growers as Sweet Peas, Nasturtiums, etc., may be made in various ways. There formality will not be an objection, a modification of the English pea hurdle will answer. Cross bars, pierced with holes, are nailed to uprights, and through the holes twine is drawn, in the manner shown in the engraving. The length and strength of the parts will be governed by the plants for which it is to be used. Those for peas are made of two-inch stuff. It is best to wet the twine before it is put on, as it shrinks and slackens less afterwards. These, if the portions in the ground are protected from rotting by gas-tar, may be preserved for several years.

The Grape Vine—How it Grows and What to Do with it.—5th Article.

Last month we extended our vine until it bore four upright canes, but this is not enough for a well-established vine, and in order to get a greater amount of bearing wood a little different course must be followed. Having our vine, figure 8, with two well-grown canes, we will first show how it is managed on the Horizontal-Arm and Spur system of pruning. This is sometimes called Fuller's system, probably because Mr. F. gives preference to it, and clearly explains it in his excellent *Grape Culturist*; but we are quite sure he makes no claim to having

Fig. 11.—ARMS BENT DOWN.

originated it. The two upright canes in the figure are to be pruned at the length of four feet, as shown by the cross line. These canes are to be bent down to form horizontal arms, from the buds of which upright, fruit-bearing shoots may grow. We assume that a trellis of some kind has been built, and that the lower

wire or bar is a foot or eighteen inches from the ground. If these arms were to be brought to a horizontal position, and tied there at once, the buds would start unevenly. Though in a horizontal position, the buds nearest the ends of the arms are still upper buds, and are quite apt to take the advantage of those nearer the stem.

Fig. 12.—DOUBLE ARMS WITH SINGLE CANES.

To ensure an even breaking, or starting, it is better to curve the ends of the arms downwards, and not tie them to the trellis until the shoots have made a growth of two or three inches, as in figure 11. In tying the arms, observe care not to break the tender shoots, and use willow twigs for fastening; do not tie too tightly, as the arms are expected to increase in diameter. On each arm, from four to six canes are to grow, according to the variety; those with large foliage requiring more room must have the canes farther apart. The shoots desired for canes should be from the upper side of the arm, if possible, but if from any accident this is not practicable, one from the under side may gradually be trained up. All other shoots are to be rubbed off. As these upright shoots grow they must be carefully tied to the trellis; they will probably set three bunches of fruit each, but one of these, or even two, if not a very vigorous vine, should be removed to prevent the common injury of overbearing. The shoots, during the summer, are to have the same care in pinching laterals, removal of insects, etc., as we have already indicated, and when they have reached the height of about two feet, the top, or growing point, is to be pinched. There is much objection by some, to this summer pinching. The reason

Fig. 13.—VINE WITH DOUBLE ARMS.

for it is the same as we gave for pinching the laterals—it produces greater health and vigor in the remaining foliage, and enables it the better to resist disease; the forces of the vine which would be expended in prolonging the shoot, are diverted to other uses, among which is the better nutrition and development of the fruit.

If all has gone on well, the vine at pruning

time will have the appearance shown in figure 13—two horizontal arms, each bearing six or less upright canes. In the figure, one cane has the fruit left on, merely to show the place in which it is borne. If it be desired to keep the vine in this form, each upright cane is cut back to a single bud; but usually two canes, instead

of one, are grown, and from what has been before said, it will be readily seen that this may be effected by cutting the canes back to two buds. This will leave the vine, after it is pruned, with two horizontal arms, along which are a row of upright stubs, called *spurs*, which have two buds upon each. The next year after the arms are laid down, if this kind of pruning has been done upon the vine, it will

throw up two shoots where one stood the year before. These will bear fruit, and during the summer require the same treatment as that indicated above for a single shoot. In autumn the vine will appear differently, and present to the pruner two canes instead of one; figure 13 gives a portion of an arm of such a vine. In pruning at this time, the object is, to so treat the vine that it shall continue to produce two

Fig. 14.

shoots and no more from each spur. The pruning for each cane is just that described last month for treating a young vine, to make it produce only two canes—cut away one cane altogether, and shorten the other to two buds. The manner of doing this is shown in figure 14, in which the parts are given larger than in the preceding figure; the cross-line shows where the cut is made to remove one cane entirely. The pruning is done in the same way, year after year, observing to alternate at each pruning the side from which the cane is removed. If the left hand cane is taken away this year, remove the right hand one the next. With weak-growing varieties it is advised by some, not to lay the arms down the full length at once, but to lay down an arm for a third of the length, and the next year extend it by laying down as much more of the canes at the extreme ends of the arms, and so on, these canes having been allowed to grow four or five feet long and trained in an inclined position for the purpose.

The arms need not be taken from as near the ground as above described, but may be started at any convenient height, on a vigorous vine, all buds below being, of course, rubbed off. This allows vines to be grown in tiers, one above the other. A single arm, where circumstances require it, can be grown as well as a double one, by laying down a single cane instead of two. These are the main features of the Horizontal-Arm and Spur system, which is one which has its opponents as well as its advocates. Where well followed out, it has been, so far as we have seen it, successful; neglect is fatal to it.

LIMA BEANS.—The dried Lima Bean always brings a good price in the market, and the supply is often quite short of the demand. Ten

dollars a bushel is not an unusual price for the beans. We do not know of any instances where they have been grown on a large scale, and cannot tell the yield per acre; but think that it is a crop that offers fair inducements for some to make a specialty of it. A rich, gravelly loam best suits them. Plant in hills, four feet apart each way, setting first a pole about eight feet high in each hill, and pressing the beans into the soil, eye down. Put ten beans to a pole, and cover an inch deep, and if all grow, thin to four. If they are rotted in cold rains, replant. Give good cultivation until the vines shade the ground. Near a market it will be more profitable to sell the beans green, but those away from large towns can allow them to ripen, and send them to market at their convenience. It is a common practice to pick the beans green, shell, and dry them. They meet with a ready sale, except just when green ones are fresh. They are soaked until plump, and sold in the condition of green beans, in our city markets.

A Weeding Hook.

The readers of the *Agriculturist* are indebted to Mr. J. Fink, of Baldwinsville, N. Y., for a number of useful contrivances, and he now sends us a drawing of a weeding hook, which he and his neighbors have found very efficient in the garden. Figure 1 shows

Fig. 1. being bent and

Fig. 2.

mounted in a handle. Mr. F. finds that a tool of this kind takes a sharp hold upon weeds and is very effectual in bringing them up by the roots.

PRUNING EVERGREENS.—Our common evergreens, Spruces, Firs, Hemlocks, and Arbor Vitae, may be pruned with as much freedom as deciduous trees, and brought into any desirable shape. To get a dense, green pyramid, always keep the lower branches longest. The new growth may be shortened-in in summer. In cutting, some care should be exercised, especially with the spruces and others that push large, vigorous shoots. These should be severed with a sloping cut from below, which will show much less than a square cut. Hemlocks are most patient of shearing, which may be done while the trees are in full growth.

Spruces, Hemlocks, and Firs.

Among the Spruces, Hemlocks, and Firs, are found most of the really popular evergreens for general cultivation. Our own woods furnish some of these, and several from other countries make themselves quite at home in our grounds. The Hemlock is readily recognized, but to many persons it is not easy to distinguish a Spruce from a Fir. The catalogues and books are bothersome, as there we find the botanical names *Abies*, *Tsuga*, and *Picea*, and used in different ways by different authors; and even botanists of reputation are not agreed in their application of names. A more extended knowledge of these trees has shown that the characters upon which they were divided into the three genera mentioned above, were not to be relied upon, and in his new Book of Evergreens, Mr. Hoopes has very properly placed them all under *Abies*. He makes three divisions of the genus: 1, the True Spruces (*Abies* proper); 2, the Hemlock Spruces, (*Tsuga*); 3, the Firs, (*Picea*). The most

to five, and the cones, which ripen the same year the trees blossom, while in the Pines they do not mature until the year after. The Spruces have their leaves pointing in every direction, and pendent cones; the cones of the Hemlocks

favor, and he gives an account of seventeen varieties of this most popular tree. The beautiful Menzies' Spruce (*A. Menziesii*), though successful with him is often injured elsewhere.

The Himalayan Spruce (*A. Smithiana*), fig. 1, is as uncertain as it is beautiful, and can be raised in the latitude of Philadelphia only with the greatest care. Our author is decided in his preference for the native Hemlock Spruce (*A. Canadensis*), fig. 2, which he considers, and justly too, according to our notion, as the evergreen of evergreens. Douglass' Spruce (*A. Douglasii*), is in the same list with the Himalayan, satisfactory sometimes. Among the Firs, the Balsam Fir (*A. balsamea*), fig. 3, gets faint praise; the young plants are beautiful, but the old ones are shabby. The Cephalonian Fir (*A. Cephalonica*); Nordmann's Fir, (*A. Nordmanniana*); Great Silver Fir (*A. grandis*); the Siberian Silver Fir, (*A. Pichta*); and other less common species, are commended for general cultivation. All lovers of beautiful trees, and their number is rapidly increasing, will find Mr. Hoopes' work a most interesting

Fig. 1.—*ABIES SMITHIANA*.

are hanging down, but the leaves spread in two directions, and appear as if placed in two opposite rows along the stems; in the Firs, the leaves seem to be more or less two-rowed, but the cones are erect, and their scales fall away when ripe,

while in the cones of Spruces and Hemlocks the scales remain. We are glad that Mr. Hoopes has placed all these trees under one generic name, as nurserymen and cultivators need not hereafter be bewildered with *Abies* and *Picea*. Mr. Hoopes gives an account of the hardness of the different species, as well as their other qualities, derived from his own experience and his observations in the collections of others; so that the work, while it aims at scientific accuracy as far as names and descriptions go, is nevertheless exceedingly practical. The common White Spruce (*Abies alba*) comes in for a just share of praise, while its brother, the Black (*A. nigra*) is not recommended, on

account of the unsightly character of the tree when past its youth. The Norway Spruce (*A. excelsa*) is, of course, high in the author's

Fig. 2.—*ABIES CANADENSIS*.

obvious differences between the plants of this genus and the Pines are the single or scattered leaves, which in the Pines are in clusters of two

one. It is the only work published in this country that gives the latest experience with evergreens, and is fuller than any foreign one.

Fig. 3.—*ABIES BALSAMEA*.

one. It is the only work published in this country that gives the latest experience with evergreens, and is fuller than any foreign one.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

A Wire Egg Stand.

The engraving shows a convenient and neat arrangement for cooking eggs. The eggs may be placed in the stand and put into the water and removed all at once, while the same contrivance which has aided their cooking will serve to place them properly upon the table. There is scarcely anything upon which people are more fastidious than the manner of cooking eggs. Some like them hard all through. Others follow the old three-minute rule,

STAND FOR BOILING EGGS.

which keeps the eggs in boiling water for three minutes by the clock or egg glass. This makes the part near the shell overdone, and leaves the center nearly raw. Our way is to put the eggs into a saucepan of boiling water, which is immediately removed from the fire, but kept hot for five minutes after putting in the eggs. They will then be nicely and equally cooked all through. The stand here figured will allow all the eggs to be cooked alike, whatever may be the preference as to style. It is to be had at the city house-furnishing stores.

Household Ornaments.

FLOWER-GLASS WORK STAND.—The following, contributed by Mrs. Annie M. Brown, of Jefferson Co., Iowa, is familiar to many of our readers, but will be new to many others: "Almost any one who can work with an edge tool can make the frame of the stand. No matter if it is rough, only construct it so that it will set firmly. To insure this, have the bottom made of $1\frac{1}{2}$ inch oak plank, the top of one inch pine, or other light lumber (fig. 1). The

Figs. 1 and 2.—STAND UNCOVERED AND COVERED.

material used for the cover of the stand can be of furniture calico, plain worsted goods, or damask, to suit one's fancy or convenience. Cut a circular piece just fitting the top of the stand, and to this sew the skirt, as we shall call it, without gathers. The skirt should be long enough to reach a little under the foot of the stand, and may be confined there by a draw-string around it, or fastened around the circular foot by brass-headed tacks. The simple cord with tassels, that is tied around the middle and binds the cloth in fluted folds, gives grace and beauty to the stand. To convert this into a work-stand for the sitting-room, whose ready pockets shall hold grandmother's knitting work, mother's variety of work, and Minnie's crochet work, you have only to take a strip of the cloth, in length one

and two-thirds the circumference of the top, and from nine to twelve inches in width; gather this until it fits the circumference of the skirt, and sew it around it as far from the top as the strip is wide; now loop this up to the top at intervals, to form the pockets, sewing up between each loop to make the divisions. Figure 2 shows the stand complete.

HARP CARD CASE.—(Annie M. Brown, Jefferson Co., Iowa.) Take a piece of heavy pasteboard, 12 or 14 inches square, draw on

it the figure of a harp, and with a sharp penknife cut it out, leaving narrow strips in imitation of the chords of a harp, and leaving also one cross-bar near the top to hold it firmly together. To form the rack, cut out of pasteboard, not so heavy as the first, scalloped or fan-shaped pieces, $1\frac{1}{2}$ inches across, 16 or 18 in number. Cover these and the whole harp, except the chords, with delicately tinted paper pasted on. Cover the chords with strips of gilt paper. Paste a narrow binding of gilt around each scallop and around the margin of the harp. Now, sew these scalloped pieces on either side of the harp, from the top downward, lapping partly on each other as seen in the engraving. Cover the stitches of the last two put on by a small rosette or bow of ribbon. A bouquet of gilt flowers may be pasted on the vacant space at the bottom, and a sprig on either side at the top. To produce a richer effect, scallop shells, readily obtained near the sea, might be used in lieu of the paper scallops.

Fig. 2.—CARD-RACK.

Household Talks.

BY AUNT HATTIE.

"Don't you put pepper and salt on your meat before roasting?"—Never, on a joint of mutton or a piece of beef or veal; but I consider it a great improvement to rub a little salt on pork. I make this distinction because my experience has tested its value, and I know that all good meat cooks do the same. Salt hardens and toughens meat, and consequently would spoil beef or mutton; but pork is so tender that its effects are not perceptible, and the flavor is much improved by the addition. Pepper I reject entirely from all kinds of roast joints of meat, unless a forecment is made, when I use it, of course.

"I notice that you have no water in the pan."—Certainly not; if it were not a reflection on so many thousands of good housekeepers, and upon you also, I should say a more ridiculous practice never was introduced into the art of cookery. Why do you put water in the pan? You say—"to keep the meat from burning on the bottom, and also to baste with." Ah! yes! I see that is the idea with all who advocate this method. Now, to end the controversy, let us see what the dictionary gives as the meaning of this word. Here it is—"Baste—to moisten meat with butter or fat in roasting;"—nothing about water, you see. My way is this: I wash the joint, and wipe it dry, then place on a clean pan, with the fat and skin side up, put it into a hot oven and leave it there until the heat has started enough of the oil of the fat to baste with, when I draw the pan towards me, to take up a spoonful of grease and pour over the meat for a few times, when I close the door immediately; this should be done four or five times during the roasting process. When it is of a rich, dark, and beautiful brown—which for this joint, you see, has taken about an hour—I take it from the pan and place on a warm platter, skin and fat side up again. Then I pour this grease from the pan into my dripping pot, being careful to keep back with a spoon this rich brown juice, which has exuded from the meat. This remaining gravy I leave in the pan, placing it on the stove, and adding about a gill or wine-glass full of water. Let it come to a boil, and then pour it over the meat. Be very careful that the platter is quite warm, that the gravy may not be chilled. The plates, also, for a properly served joint should be well warmed, but not made hot enough to burn the fingers or the table-cloth.

Salt and pepper and catsup may be added to the gravy while being made, if preferred, but never on any account put flour to the gravy of beef, mutton, or pork; always do so for chicken and veal gravy. "What nonsense!" you say, "I see no reason for making such a distinction." Yes! but, my dear madam, there are several good reasons for the difference, which we will not discuss at present.

"How do you like my new newspaper holder?" It is very simple, and easily made. I found in my attic two square pieces of pasteboard; when I went to the city I bought a sheet of black enamel paper which cost 8 cents, and 7 cents worth of gilt bordering, 4 tassels and 4 yards of thin cord for 50 cts. I found in my collection of paintings a pretty landscape, which I took also for this purpose; then I made a little flour paste in a tin cup, and was ready to make my holder. The two pasteboards were square and exactly the same size, and I cut from each corner an equal piece, making two octagons. One I laid on one side for the back. The whole was covered first with the black paper, using the paste to stick it smoothly; when dry, the gilt border was added, and then I pasted the picture exactly in the center. The back was finished in the same manner, placed even with the front, and fastened to it with the cord, as in the engraving.

My little girl received from her grandma a very beautiful head of a doll, for her Christmas present. I made a nice body for it, and she enjoyed its society immensely, but one morning she came crying and holding in her hands the head completely severed from the neck. At first I supposed it utterly spoiled, but after thinking awhile I concluded that it could be mended. I always keep a bottle of china cement, which I find convenient for piecing ornaments, and crockery which will not be used in cooking. After applying the cement I lined the neck and head with a thick coating of good glazier's putty. It took a week to dry, and is apparently as firm and strong as ever.

What a splendid teacher experience is, and more especially in the management of children! Strange what a difference between the treatment of the first child and the fourth or sixth! Our first, from the time he was a month old, gave us no peace until after he was over two years. We never thought of a wakeless night, and three out of every week Ed-

NEWSPAPER HOLDER.

ward and I and the girl would be up rocking, and tossing, and swinging, by turns. We never talked, or even whispered, while he slept, for as certain as we did, as certainly would he wake again, and an hour or two would be spent in getting him to sleep. We offended both grandmas dreadfully because we would not listen to their mature experience. We starved and stuffed him by turns—had the doctor every other day, and sometimes twice in one

day, it he happened to roll his eyes or kick a little differently from usual. We never went to bed without the wash boiler being filled and a good fire under, in case of croup, though as I look back upon it I cannot imagine what our idea of the proper treatment of croup could have been, or why we should have considered such a thin, active, and bony child a fit subject for that disease. We always let him have his own way, and when he was old enough to eat milk and bread, he invariably finished his meal and returned thanks at the same time by deliberately throwing his bowl on the floor. Before he was 18 months old he had broken two or three sets of breakfast cups and saucers, any quantity of bowls, and all the pieces of a pretty cottage set of china, excepting two bread plates. We bought for him a beautiful carriage, in which he never could be induced to ride, but which he insisted upon pulling and pounding until he had spoiled it altogether. Affairs were in this state when his kingdom was usurped by another addition to the family, and my eyes were opened to the necessity of reducing the exuberance of his spirits, and of establishing some system of law and order. The struggle was tremendous, and, as the Gipsy woman would say, many were the whackings I gave him, until finally he was brought under subjection, and now sets a tolerably good example to the younger children. "Thy cruelty to a child to neglect his training until he is a year or even six months old. When old enough to know his mother, it is old enough to know that when she says no, the command must be respected, and I never find it necessary to more than punish by a gentle pat on the hand, admonishing at the same time by saying "no! no!" or "Georgie mustn't." I don't think my youngest child has broken three pieces of crockery of any description during the three years of his life, and when I say "no," he turns away immediately from any coveted object; and all this important change in my domestic government I attribute to a little, or perhaps I should say a good deal, of experience. I often think how much severe discipline I might have spared my oldest boy—how much care and anxiety myself—how much uneasiness the two grandmas—how much the health of the child himself might have been benefited—had I been a little more humble, a little less nervous, and a little more willing to listen to the experience and advice of my own and my husband's mother.

Making a Cool Box.

An ice-box or refrigerator is unquestionably the best thing for families in city or country, where ice-houses are accessible, or where ice is distributed regularly in small quantities. But many farmers have not learned the economy of an ice-house, and have no facilities for supplying an ice-box. To such, the contrivance recommended by our correspondent may be of great value for keeping butter, cream, meats, and fruits, cool in summer. "Rev. G. A., of Minnesota, writes: "I dug a hole in a corner of the cellar, three feet by two, and two feet deep. Then from a quarry near by, I selected five smooth, flat stones, with straight edges. One stone formed the bottom, another the back, projecting above the cellar floor six inches, another the front, projecting one inch. The two ends, fitting in between these, kept them in place. The ends at the top, not fitting quite close to the back, I wedged in a piece of studding, to which, with the hinges, I hung a cover. Then, with a piece of shingle for a trowel, I filled with cement the joints of the stones, and the work was done. My wife white-washed the box and cover, which application is frequently renewed. In this box is perpetual coolness, and butter made from cream kept in it, 'comes hard' the hottest day of summer." It is not every locality that furnishes the smooth, flat stones. If these are not at hand, brick might be used, or rubble stones of suitable size for the bottom and sides of the box, the inside to be lined with a coating of cement. Or if these are not convenient, a box of wood might be made of suitable size, and buried in the bottom of the cellar to within

a few inches of the top. The wooden box would not last as long as the stone, or the cement, but the temperature would be the same, and it would pay for itself many times over every season.

Guesswork in the Household.

"Good morning, Mr. Smith. Can you tell me the road to Boston?" "How did you know my name was Smith?" replied the man addressed, standing somewhat on his dignity. "I guessed it," was the reply, and the guesser was pluming himself on his shrewdness. "Guess your way to Boston then," came the gruff rejoinder, which at once convinced him that guessing was a guide not always to be trusted. Probably the Yankee nation, (they are not confined to New England) are as shrewd at a guess as any other people, which perhaps has led them to overdo the matter, and "guess," or "reckon," or "calculate," when a certainty could easily have been ascertained. A case in point, considerably affecting domestic economy, is the uncertainty of measures and weights used in the household. From time immemorial, cooking recipes have been followed out by "cupfuls," and a "pint to the pound" has been the standard of weight. The pint for the pound has been usually ascertained by a tumbler, supposed to hold half a pint. In many cases such estimates may answer, but in the delicate matter of getting things just right, they will more frequently disappoint. Many a spoiled jar of preserves, and loaf of cake have resulted from "guessing" at the proportions. A good scale for weighing would remedy all this, and serve many other useful purposes. The heaviest eggs can be selected for setting; the weight of the fat chickens be ascertained to a notch; the pounds of honey yielded by the bees be known; the weight of the baby be noted; the pounds of butter sent to the store be made sure of; and, not less important, the honesty of the storekeeper be tested by weighing the coffee, tea, sugar, etc., brought home. In a hundred ways the housekeeper will find a good family scale superior to any amount of guessing, in each of which, except perhaps in weighing the baby, money enough to pay for the instrument may be saved—and in the exceptional case, there will be no little satisfaction, especially if it be the first baby. Recent improvements have been made in scales, giving a far more convenient article than the old-fashioned steelyard or the hanging spring balance, which should be looked after by the good man who desires to thoroughly furnish his house with labor-saving and money-saving appliances.

More about Salad Dressing—Lettuce.

A correspondent, "Saladin," writes as follows: "The article on salad dressing, in the May number, gives good directions for making one kind of dressing, called 'Mayonnaise,' and which to my notion is better for mixed salads, containing chicken, lobster, meat, etc., than for those purely of vegetables, though I sometimes use it for these. I may remark, that in making the dressing referred to, perfectly good butter is much better than any but the very best oil, which quality is seldom to be found outside of large cities. Melt the butter at the lowest possible temperature—by no means fry it—and use as directed for oil, stirring the mixture in a warm place. Perfectly sweet cream may also be substituted for oil. Lettuce may be considered as the universal American salad. I wish our people would get into the way of using more salads. The vegetables you mention are all good, but you omit two of my great favorites, potatoes and string beans. But I will just now confine myself to lettuce. The use of oil is objected to by a large number of people, perhaps by the majority, from some prejudice, probably derived from the recollections of their early experience with a certain medicinal oil; hence at most tables in the country, lettuce is eaten dressed with sugar and vinegar, with a little salt, and perhaps a dash of pepper, or some peppercorn, to give it piquancy. This is

an old English way, not to be despised for a variety, and is very acceptable at breakfast. It should be prepared only the moment it is to be eaten, as the vinegar causes the lettuce to wilt, and one of its charms, its crispness, is lost. But for the regular lettuce salad, pure and simple, the lettuce is to be washed, and well drained, then thoroughly moistened with oil and vinegar, and a little salt added. The old rule is: "Be prodigal of oil, prudent with salt, and parsimonious with vinegar." The amount of vinegar will depend upon its strength and one's taste. Of really good vinegar I use one spoonful to three of oil. Stir in a large bowl with a wooden salad spoon until every part is well moistened. This is my favorite way, and furnishes a groundwork for a large number of variations, by adding chives, tarragon, celery, slices of olives, or whatever may be chosen to flavor it with; hard-boiled eggs in slices are often added. Lettuce forms the basis of many other salads. With bits of cold beef, mutton, veal, chicken or other fowl, and plenty of lettuce, a series of most excellent dishes may be formed, and with these I best like the dressing you have given. Now, in return for all this salad talk, will some of your German readers give me a good recipe for herring salad? Don't laugh, my Yankee friends; I know that herring salad is a good thing, and I wish to know just how it is made best."

Bottling Strawberries.—While the strawberries are being picked over and the stems removed, a quantity of juice will drain from them. This should be placed in a porcelain-lined kettle, with the desired quantity of sugar—a little over a quarter of a pound to a pound of fruit is sufficient for most tastes. Let this syrup simmer a little, and add the fruit. Let the whole come to a boil, and as soon as possible after it boils all throughout, bottle or can, completing one at a time. Glass bottles should first have a little warm water put into them, to warm them and prevent the bottle from breaking. This is, of course, to be poured out before the fruit is put in. Every bottle should be full at the time of putting on the lid; when cold, the contents will have shrunk considerably.

Bottling Raspberries.—Red raspberries are the best for this purpose. Proceed in the same way as for strawberries. If no juice runs from them, add a little water, or place the dish of fruit on the back of the stove, and the juice will soon start. Many use water always, though they will be much richer without. A little red currant juice added is a great improvement.

Raspberry Vinegar.—Use red berries, and to two quarts, add one quart of good vinegar. Let it stand 24 hours. Strain through a flannel bag, and pour the juice over two more quarts of fruit; let it stand as before, and strain again. Allow three-quarters of a pound of loaf or good white sugar to every pint of juice. Strain well, and place in a stone jar, and cover. Set the jar in a kettle of water, and let it boil until the sugar is dissolved. Bottle for use. A tablespoonful to a tumbler of water makes a pleasant drink for invalids, or for any one in the intensely hot summer months.

To Have Vegetables of a Good Color. put them into boiling water, and let the water boil, but allow no lid on the kettle. Peas and asparagus, especially, are kept of a fine green color by this treatment.

Crumplets.—Mix a quart of flour with new milk and a little salt—making a batter—add a tablespoonful of brewers' yeast, or a half teacupful of home-made yeast. Beat thoroughly two eggs and add to it; set in a small rack by the fire. When well risen, should be baked in rings in an oven or on a large griddle.

To Cleanse Ribbons.—Allow an equal quantity of soft soap made of wood ashes, (prepared lye soap will not do,) honey or molasses, and alcohol or common whiskey; mix well together. Spread the ribbons on a table, and rub briskly with the mixture. Rinse thoroughly, and iron while damp. Do not rub with the hands, or wring, but gently squeeze the water from them.

Lamp Chimneys often crack from being fastened on too tightly. The screw is applied while the chimney is cold, and often so tightly as to prevent the glass moving at all. Of course, when the chimneys are heated there is no room for them to expand, and consequently they must crack. Always see that the glass is secure, and at the same time moves easily in the holder.

BOYS & GIRLS' COLUMNS.

Wanted—A Boy with Ten Points.

1. Honest. 2. Pure. 3. Intelligent. 4. Active. 5. Industrious. 6. Obedient. 7. Steady. 8. Obliging. 9. Polite. 10. Neat. One thousand first-rate places are open for one thousand boys who can come up to the standard. Each boy can suit his taste as to the kind of business he would prefer. The places are ready in every kind of occupation. Many of them are already filled by boys who lack some of the most important points, but they will soon be vacant. One is in an office not far from where we write. The lad who has the situation is losing his first point. He likes to attend the circus and the theater. This costs more money than he can afford, but *somehow* he manages to be there frequently. His employers are quietly watching to learn how he gets so much extra spending money; they will soon discover a leak in the money drawer, detect the dishonest boy, and his place will be ready for some one who is not getting ready for it by observing point No. 1, and being truthful in all his ways. Some situations will soon be vacant, because the boys have been poisoned by reading bad books, such as they would not dare to show to their fathers, and would be ashamed to have their mothers see. The impure thoughts suggested by these books will lead to vicious acts; the boys will be ruined, and their places must be filled. Who will be ready for one of these vacancies? Distinguished lawyers, useful ministers, skillful physicians, successful merchants, must all soon leave their places for somebody else to fill. One by one they are removed by death. Mind your ten points, boys; they will prepare you to step into the vacancies in the front rank. Every man who is worthy to employ a boy is looking for you, if you have the points. Do not fear that you will be overlooked. A young person having these qualities will shine as plainly as a star at night. We have named ten points that go toward making up the character of a successful boy, so that they can be easily remembered. You can imagine one on each finger, and so keep them in mind—they will be worth more than diamond rings, and you will then never be ashamed to "show your hand."

Presence of Mind.—An English writer relates the following incident. A lady was in front of her lawn with her children, when a mad dog rushed toward them pursued by several men. Most persons would have screamed and done nothing, or at once taken to their heels and left the poor children to their fate. Not so this mother. Nerved to resolution by love of her children, she walked straight toward the dog, received his head in the folds of her skirts between her knees, and held it with all her might until the men came up and secured it.

Ways of Getting a Living.

THE BLIND PIPER.

One of the first thoughts of a person coming from the country to New York, and seeing the crowds of people who throng the streets, is, "How do they all get a living?" To answer this fully would require large volumes. There are hundreds of ways of making money in a large city, which, fortunately, are unknown outside of its limits. We have prepared illustrations showing some of these that may interest the young readers of the *Agriculturist*. The above is a correct portrait of a blind piper that has been regularly seen in the streets of New York for many years. His favorite resting-place is on the stone coping of the railing around Trinity Church, on Broadway, at the head of Wall Street. Usually a little girl sits by him to receive the pennies that may be dropped by the compassionate passers. The sound produced by his playing on the bagpipes is execrable. Filing saws would be

music compared with it. When performing, he twists and works his body convulsively, and it might reasonably be thought that the sounds brought out from his instrument were the voices of the aches and pains tormenting his poor body. Of course, such a spectacle excites the pity of the beholders, and that pity is worth to him probably several dollars per day. We do not know how much he has realized by his performances, but probably considerably more than if he had played passably well, and left out the accompanying contortions with which he plays on the public as well as on the bagpipes. At any rate he makes a living, and looks able to blow for years.

Who First Lived in America?

Perhaps only such Indians as were found here by Columbus and those who followed him were the aborigines of America, but discoveries are continually coming to light that point to races of men superior to savages. The following account of a recent occurrence is given by the Knoxville Press. "Mr. William Staples owns a valuable farm on Poplar Creek, about twelve miles north-east of Kingston. For many years past attention has been attracted to a particular locality on his farm, from the fact that the cattle were in the habit of resorting to the place, and making thereby what was known as a 'lick.' The attention of Mr. Staples being thus called to the subject, he resolved to investigate the matter. Accordingly he commenced to excavate upon the premises. After digging down about seven feet, he struck a solid limestone rock. He found a well about eight inches in diameter, from which he procured salt water strong enough to enable him to obtain salt by boiling. The most remarkable feature of this discovery consists in the following: After the discovery of the well, Mr. Staples prosecuted his investigations, and found, to his surprise, a line of salt kettles. The kettles were of stone ware, made of the same material as that used by the Indians for their home ware, such as plates, dishes, etc. The kettles were broken, but the curvature indicated that they were about three feet in diameter, and were about forty in number. A most striking fact connected with this discovery is that these kettles were found at a depth of seventy feet below the surface of the ground. Growing above them were trees—poplar and oak—which were evidently two centuries old. Will some of the antiquarians explain this? Who bored that salt well? Who made those kettles? Who founded that furnace? Who were our aborigines?" Who can tell?

A Pleasant Picture.

A young correspondent writes to the *American Agriculturist*: "On the morning of the 16th of May, (my birthday,) I shall hear the well-remembered call, 'Frank! Frank! I can and drive the cows to pasture.' Going to pasture is quite an event of the season to me. No more naps in the morning! I have to go a mile and a half, and in summer get back in season to ride horse after breakfast, for cultivating, while father holds the cultivator, so the men can hoe while I am at school, a mile in another direction. On this particular first morning or two, it takes two of us to go, as the cows and young heifers are so delighted to get out at their liberty that they cut up all sorts of antics, and start off up any road they choose. Father goes in the wagon as a rear guard, and I have to dart up the road nearest to us, and drive them back, and by the time I get them into the main road they are racing madly along, and do not go quickly until they run into the lake; they must take a drink there. Father rides in after them, and after a while we get them all out, and then up a long, gradual slope of the road to the pasture bars; then they all run up to eat the soft, fresh grass. At night two of us must go again, to separate the milch cows from the heifers, which are to stay there. I can now have leisure to look about me as I go home. There is always something to notice or to find. The Lake Kenosha is about two miles long and one mile wide. The name Kenosha is an Indian word for pickerel, and it is a good place for fishing. When the sun is rising over the wooded hills, and shines upon the thin, fleecy vapor rising from its surface, it is very beautiful. I might say it is always beautiful. On the east side it is bounded by a hill, covered partly with dark hemlock—a great place for mosses and Mitchellia, which blossoms the first week in July; then south-east there is 'solar meadows,' which is remarkable for its great variety of flowers in summer, and its black turtles. South of the lake there is a beautiful wooded hill, and west, a locust grove and cultivated fields. North-west rises Mount 'Meenahyah,'—which means blueberry—where the earliest blueberries grow; and on the north side the road winds along 'As old roads will, This to a ferry and that to a mill.' Crescent Point is a peninsula projecting into the lake on its north side, and is covered with maples, birches, willows, and filled up with underbrush. Here grows a great profusion of partridge berry, which blossoms the last of July, and so much 'white spoked' Clothra that we thought of naming it Clothra Point. I carry home large quantities of it in its season. By the

roadside I find the beautiful white Morning Glory tinged with pink, which we have named the Sunrise Morning Glory, and wild roses in abundance. In the autumn, by the lake side, we find a rich, dark, purple Aster, with larger flowers than usual, which we find nowhere else. Mother has had them from this place for 27 years, and never saw them elsewhere. These things are not all I see. I get a chance at a rare birds-egg now and then—but you will not want my letter to be too long."

India "Rubber" Shoes received their name from the fact that the gum of which they were made was first brought from India, and because the first use found for it was to rub out pencil marks from paper. The proper name of the gum is *Caoutchouc*. In some places, rubber overshoes are called "gums," referring to the substance of which they are made. It is related that a gentleman and his wife going to spend the evening at a house where they were well acquainted, he entered the parlor alone. Some one asked "Where is Emily?" meaning his wife. He at once answered, "Oh, she is outside, cleaning her gums on the mat." The reply caused a stare of astonishment, and then a hearty laugh naturally followed when the meaning was comprehended.

A Natural Mistake.—A lady promised to bring her little boy a cocoanut on her return from the city, but could only find one with the husk on. This she gave to the child, who had never seen one in this state. He looked at it curiously, smiled, and laid it down. Presently he said, "Mother, where is the cocoanut you promised me?" "I just gave it to you," she replied. Taking it up again he viewed it contemptuously for a moment, and then exclaimed, "That thing a cocoanut! I thought it was a new waterfall you had bought!"

Sparse Woods.—A miner who lately came from Virginia City says that vegetation is so scarce in that region that "two mile stalks and a bunch of thistles are called a grove."

Answers to Problems and Puzzles.

The following are the answers to the puzzles in the May number, page 191: No. 304. *Illustrated Rebus*.—A great ark or is generally a great bore, or a great talker is generally a great bore. No. 305. *Puzzle Picture*.—A race of pale faces. No. 306. *Pig lead* (*lead*). The following have sent in correct answers to puzzles previously published: Arthur H. Sawyer, L. M. Wright, John M. Miller, Daisy Wilder, J. Milton Snyder, (as usual), Arthur Moffatt, Albert Cope, Mrs. Morgan, Emma L. Leavitt, "Rebel," Jas. & E. Lowe, Geo. C. Gill, Etta M. Danser, J. N. Averill, Carrie Leslie, T. S. Cadwallader, Frank A. White, David M. Neil, Marie D. Butler, Albion C. St. C. A. G. Hamblin, Lydia E. Moore, A. H. Haddock, Henry Dunn, Annie Brown, Susie Jones, M. Vandervoort, Ruth Carter, Frank Monroe, John Nicoli, C. O. Bassett, Oscar Kissam, Ellie L. Rankin, J. McCluskey, Arthur Brink, Jas. A. Johnson, Ethel Woolman, J. H. Brust, Philo Hall, W. Shelly, Hammond W. Ormsbee, Mary E. Oster, Alfred Delisle, Augustus Reifstuck, James E. Demarest, George Smith, A. Leach, S. Ambrose Farnes, Levi Capp, Carrie Langdon, J. West Homer, A. Underwood.

New Puzzles to be Answered.

No. 307. *Illustrated Rebus*.—Something often forgotten.

No. 308. *Illustrated Rebus*.—Line from a favorite hymn. No. 309. *Arithmetical Problem*.—One man had two loaves of bread, his companion had five loaves. Another joined them and gave them one dollar to share their meal. The bread was all eaten by the three men. How much of the money should each of the bread owners receive?

[COPYRIGHT SECURED.]

A S P L E N D I D T E A M. — Drawn and Engraved for the American Agriculturist.

There is more real "fun," as the boys call it, with such a team as is shown in the engraving above, than with the finest carriage and horses in New York. The boy's face is mostly concealed by his hat brim, but his whole attitude shows what he is thinking of; his soul is with his team. He may well be proud of them. They need no whip, and he carries none. They gallop along as though they enjoyed the sport. The dog on the "off" side seems to be rather new at the business—a little coltish. He looks around to his companion as though inviting him to join in a runaway frolic. No danger of that; old Whitley is out on business now, and will find his pleasure in that alone. By the way, that's a secret of enjoyment unknown to many. Most people, old and young, are looking away from their work and their present circumstances for happiness. They are like men wading through a river in chase of a log to quench their thirst with. Make the most of the *present*, as this boy and his team are doing, and thus secure the good it contains.

Another Charitable Dog.

W. Winker, of Baltimore, Md., having noticed the dog story in the April No. of the *Agriculturist*, writes: "I was owner of a dog that went through the same maneuvers as the one described. This dog answered to the classical name of 'Mouth.' She was scarcely eight inches long, and was brought from Mexico. While in Baltimore she showed considerable affection for a rat terrier that seemed to live in reduced circumstances. As my window overlooked the yard, I observed myself how she would coax the large dog to her store-room, and wag her tail with satisfaction at the hungry guest's relish of the bones. It would hardly have been prudent for any other

dog even to smell of the food which the little animal considered her own. She was also a good mother, and divided all dainties with her young—showed great cleanliness, and would always coax her young to the door, to prevent them from greasing the carpet while feeding. But the greatest peculiarity is shown by an uncle of Mouth's, who was brought up in a Hebrew boarding-house, and who would not under any condition touch the excluded food. He would eat bread at all times, but no sausage, ham, or pork. I have often experimented with him, but always found him true to his principles."

The Promise Kept.

The following, from an exchange, is worth reading. A mother, on the green hills of Vermont, was holding by the right hand a son, sixteen years old, mad with the love of the sea. And as she stood by the garden gate one morning, she said: "Edward, they tell me, for I never saw the ocean, that the great temptation of a seaman's life is drink. Promise me, before you quit your mother's hand, that you will never drink." "And," said he, (for he told me the story.) "I gave her the promise, and I went the broad globe over, Calcutta and the Mediterranean, San Francisco, the Cape of Good Hope, the North Pole and the South. I saw them all in forty years, and I never saw a glass filled with sparkling liquor that my mother's form by the gate did not rise before me; and to-day I am innocent of the taste of liquor." Was not that sweet evidence of the power of a single word? Yet that was not half. "For," said he, "yesterday there came into my counting-room a man of forty years, and asked me, 'Do you know me?' 'No.' 'Well,' said he, 'I was once brought drunk into your presence on ship-

board; you were a passenger; the captain kicked me aside; you took me to your berth and kept me there till I had slept off the intoxication; you then asked me if I had a mother. I said I had never known a word from her lips. You told me of yours at the garden gate, and to-day I am master of one of the finest packets in New York; and I came to ask you to come and see me."

A Critic Confounded.

It is related of Powers, the sculptor, that while residing in Cincinnati, he made a figure of one Alexander Drake, a popular comedian. Some of Powers' friends were so much pleased with it that they invited the editors to examine it. Among those who came was one noted for severely criticising every performance, whether competent to give good judgment or not. The show room was dimly lighted, and the figure stood in a glass case. After gazing at it very intently several minutes, the critic said to Powers, who stood near him, "There are some good points about this, Hiram, but it has some extraordinary defects. The nose is too long entirely; and the mouth has a queer twist. One arm is longer than the other. The position, too, is unnatural. No man could stand that way if he tried. It would be impossible. I don't see, Hiram, how you could have made such a blunder." Powers laughed, and inquired of the figure:—"What do you think about it, Drake?" The figure immediately stepped out of the case, and, bursting into a loud laugh, said: "I think the position pretty natural, myself." The critic did not hear the last of the jest, and, it is said, he would never afterwards speak to the factious sculptor.

The new moon reminds one of a giddy girl, because she's too young to show much reflection.

[COPYRIGHT SECURED.]
WEIGHING ON THE FARM.

The above engraving is designed to call attention to a subject now receiving much attention, and worthy the especial consideration of every farmer. The profits of farming depend very largely upon attention to things small in themselves, but in the aggregate amounting to a large share of one's income. One pound difference in the weight per bushel of grain, is not of itself a great matter, but the difference of the crop resulting from sowing the heavier or lighter sample may amount to hundreds of dollars when the crop is harvested and sold.

This is but a single illustration of the immense gain that might be realized by the use of a good Platform Scale as part of the regular farm apparatus. The following extracts show the importance attached to the subject by good authorities.

The *American Agriculturist*, (May number), says: "Scales should be used in every house and barn. The proverb says, 'Deliver all things by measure and weight,' and it ought to be heeded. Have Fairbanks' Standard Scales in the kitchen, and prove which grocery man gives weight, and buy of him. Weigh butter and everything sold, and not *mistrust* that you are cheated. Weigh the chickens and see which kinds are thriving and profitable. Have a Fairbanks in the barn, and weigh the pigs and stock and grain and hay and fertilizers, and thus know what is paying and what is not. A little practice in this line will pay a hundred fold in money and satisfaction."

The following from the *Country Gentleman*, of April 2, 1893, is equally to the point. "A half-bushel measure is considered indispensable by every farmer. He does not sell his potatoes or grain, guessing at the contents of the bin or the pile on the floor—it must be measured. With this instrument at hand, he may know just how much corn is fed to the hogs and poultry; how many oats to the horses; how much seed is sown upon the land, and many other points equally valuable to know. But a good weighing scale is possessed by comparatively few, although its use would in many ways be even more valuable than that of the half-bushel. For instance, in selling live stock, the weight is usually estimated by the drover or butcher buying at the farmer's door. Long practice enables the buyer to weigh them very correctly with the eye, and thus he has the inexperienced seller at an advantage, which he is not slow to use. A good Fairbanks' standard platform scale would save its cost in a few such transactions.

The weight of wool, butter, and other farm products, should be ascertained at home, to prevent mistakes and dishonesty in weighing after the goods have been sent to mar-

ket. The weight of grain per bushel, the gain of cattle under different systems of feeding, exactly when an animal ceases to increase by feeding, and many other important facts, can readily be determined by having a good scale. It should be part of the furniture of every farm. Fairbanks' scales have been named in this connection, as being entirely reliable, having been adopted as the standard in this and other countries."

The following extracts from remarks made at the New York Farmers' Club, were heartily endorsed by Horace Greeley and other prominent members present. "Farmer No. 1 feeds his cattle until he thinks they are fat enough to turn off, sells them to the butcher at their *estimated* dressed weight, and pockets the proceeds. How much of the amount is profit he cannot tell; he did not measure the feed nor weigh the animal.

Farmer No. 2 feeds out grain by measure or weight, and charges it to the bullock; at intervals of a week or so, he rigs his platform scale so that the animal can stand upon it, notes how much beef it shows for the grain eaten, and when the feeding does not pay, sells to the butcher or drover. In doing this he is not afraid of the buyer's practised eye, which can almost fix the notch at which a bullock will turn the scale. He has consulted his unerring Fairbanks, and knows when the right price is offered according to the rates quoted in his last week's paper."

That the above tributes to Fairbanks' Scales have been fairly earned, is shown by their having taken more first premiums at State and National Fairs than all others combined. At the great Paris Exhibition last year they received THE HIGHEST PREMIUMS, TWO MEDALS.

Still better testimony is given in the fact that their sales have been constantly increasing for **forty years past**, extending to *all parts of the world*, and exceeding those of all others.

Send for Pamphlets with illustrations and descriptions of more than 100 modifications of the above scales, adapted to weighing on the farm and in every branch of manufacture and trade.

ONE OUNCE OF GOLD.

Will be given for every ounce of adulteration found in "B. T. BARRITT'S LION COFFEE." This Coffee is roasted, ground, and sealed *hermetically* under letters patent from the "United States Government." All the "Arona" is saved, and the Coffee presents a rich, glossy appearance. Every family should use it, as it is fitted to twenty per cent stronger than other pure "Coffee." For sale everywhere. If your grocer does not keep this Coffee, will not get it for you, send your orders direct to the factory.

B. T. BARRITT,
Nos. 64, 65, 66, 67, 68, 69, 70, 72 and 74 Washington-street,
New York.

BEST CIDER MILL.

THE JERSEY

POWER APPLE GRINDER.

(BUTTERWORTH'S PATENT.)

For grinding Apples, Peaches, Sugar Beets and other kinds of fruit and vegetables. This greatly superior machine is rapidly growing in favor among the Cider makers and farmers of our country, and is destined soon to supersede all other mills used in the manufacture of Cider. For Illustrated Pamphlet giving full description and containing also testimonials from many of the most extensive Cider-makers in the country, with much other valuable information.

Address: Patentee and Sole Manufacturer, Trenton, N. J.,
J. R. DECATER & CO., Agents, 197 Water-st., New York.

Waterman's Patent Cast Iron Roll Pans

For baking *French Rolls, Gales, Pop Overs, Corn Bread*, etc. The best article in use, see editorial notice page 25 in Jan. No. of *Agriculturist*. Manufactured and for sale by the owners of said patent, HUSSELL & ERWIN MAN'G CO., New Britain, Conn., their warehouses at New York, Philadelphia, Boston, Baltimore, and San Francisco.

Inquire for Waterman's Patent Bake Pans. Recipes furnished with the pans.

Dealers please send for Illustrated Circulars.

FAMILY KNITTING MACHINE.—The best Family Knitter out is the one manufactured by the BRIDGEPORT KNITTING COMPANY, at Bridgeport, Conn. PRINCIPAL AGENCIES:—Messrs & Reynolds, 219 Washington-st., Boston, Mass.; O. L. Woodruff, Detroit, Mich.; Hiram Miller, Madison, Wis.; Reynolds Brothers, 121 West 54-st., Cincinnati, O.; J. B. Snow, Minneapolis, Minn.

GLAZED STONE WARE DRAIN PIPE.—ROUND AND TILE WITH COLLETS. J. W. DENTON & CO., Woodbridge, N. J. Samples and prices at L. L. WHITLOCK'S, 345 Broadway, New York.

COLGATE & CO.'S

AROMATIC

VEGETABLE

SOAP,

Is particularly adapted to the delicate skin of Females and Infants.

Sold by all Dealers in Perfumery and Toilet Articles.

Shaler's Family Scales

Have no weights to lose, and require no lifting, as with the old-fashioned bushyards and ending balances.

They are Indispensable to the Housewife.

The exact weight of any substance placed in the scoop or pan is instantly indicated upon the dial, showing the number of pounds and ounces as plainly as the hours and minutes upon the face of a clock. Four years of two years' constant use has proved their entire ACCURACY and DURABILITY.

Bakers, Butchers, Grocers, and others use them. EVERY FAMILY WANTS ONE.

Three sizes are now offered, weighing 12 lbs., 25 lbs., and 60 lbs. AGENTS AND THROUGH CARRIERS are finding profitable employment. More agents are wanted. Send for pamphlet containing descriptive price list, &c. Manufactured by J. W. NASH & CO., 28 Howard-st., New Haven, Conn. Address.

ALVAN RUSHNELL, General Agent,
No. 22 Courtland-st., New York.
P. S.—ORANGE JUDT & CO., Publishers of the *AMERICAN AGRICULTURIST*, weigh all their books and packets for the mail on one of these scales, finding it *significantly accurate and economical of time*.

NEW BOOK OF FLOWERS.

By JOSEPH BRECK.

We have no work which is so safe a guide to the novice in gardening, or that imparts the necessary information in a style so free from technicalities. The following are some of the subjects treated:

Utility of Flowers.
Vitality of Seeds.
Planting.
Bedding.
Protection.
Bouquets.
Training.
Flower Gardens.
Lawns.
Flowering Shrubs.

SENT POST-PAID, PRICE, \$1.75.

ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, which have been in a former number of the *American Agriculturist*, furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily.

CHURCHES,

DWELLINGS,

BARNs,

MILLS,

FENCES,

FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale. In offering them to parents for the instruction and amusement of their children, we feel that we are doing them a service which cannot be fully appreciated until they have seen the blocks in their wonderful combinations, affording a beautiful and lasting toy to the prattling infant, and serving as a delightful study and pastime for the older ones of the family.

The Blocks are put up in neat boxes, each box containing a set, and a card giving various designs of buildings. Price per set: Plain, No. 1, \$2.00; No. 2, \$1.50; No. 3, \$1.00. Extra, Maple Finish, No. 1, \$2.50; No. 2, \$2.00; No. 3, \$1.50. A liberal discount will be made to dealers. Address

A VALUABLE HOME LIBRARY.

BACK VOLUMES

OF THE

AMERICAN AGRICULTURIST.

The publishers of the *American Agriculturist*, having preserved the electrotypes plates of the back volumes of that paper, from the Sixteenth to the Twenty-sixth Volume complete, can supply any or all of these as may be desired. These volumes contain more varied and interesting information on all matters pertaining to the Farm, Garden, and Household, than can be obtained in books costing three times as much money. They are profusely illustrated with the best of engravings, and in addition to the large amount of instructive reading matter for the older members of the Household, they contain a Special Department for the Boys and Girls. They, therefore, constitute in themselves a

**Most valuable Library for the
Farmer's Family or for any
other Home.**

The price of these volumes, unbound, is \$1.50 each, at the office, or \$1.75, if sent by mail, as they must be post-paid. The price of the same volumes, in neat cloth binding, with gilt title on the back, is \$2.00, at the office, or \$2.50, if sent by mail.

Address **ORANGE JUDD & CO., Publishers, 245 Broadway, New York City.**

VALUABLE AND BEAUTIFUL WORK.

HARRIS' INSECTS INJURIOUS TO VEGETATION.

BY THE LATE

THADDEUS WILLIAM HARRIS, M. D.

Enlarged and improved, with additions from the author's manuscripts and original notes.

Illustrated by engravings drawn from nature under the supervision of

PROFESSOR AGASSIZ.

Edited by

CHARLES L. FLINT,

Secretary of the Massachusetts State Board of Agriculture.

CONTENTS.

CHAPTER I.

INTRODUCTION. — INSECTS DEFINED. BRAIN AND NERVES. AIR PIPES AND BREATHING HOLES. HEART AND BLOOD. METAMORPHOSES OR TRANSFORMATIONS. CLASSIFICATION; ORDERS AND GROUPS.

CHAPTER II.

COLEOPTERA.—BEETLES. SCARABAEANS. GROUND-BEETLES. TREE-BEETLES. COCKCHAFERS. FLOWER, STAG, SPRING, TIMBER, CAPRICORN, LEAF-MINING, AND TORTOISE BEETLES. CHRYSOMELANS.. CANTHARIDES.

CHAPTER III.

ORTHOPTERA.—EARWIGS. COCKROACHES. SOOTH-SAYERS. WALKING-STICKS OR SPECTRES. MOLE, FIELD, CLIMBING, AND WINGLESS CRICKETS. GRASSHOPPERS. KATYDID. LOCUSTS.

CHAPTER IV.

HEMIPTERA.—BUGS. SQUASH BUG. CLINCH-BUG. PLANT BUGS. HARVEST FLIES. TREE-HOPPERS. VINE HOPPERS. PLANT-LICE. AMERICAN BLIGHT. BARK-LICE.

CHAPTER V.

LEPIDOPTERA.—CATERPILLARS. BUTTERFLIES. SKIPPERS. HAWK-MOTHS. AGERIANS OR BOWING CATERPILLARS. MOTHS. CUT-WORMS. SPAN-WORMS. LEAF-ROLLERS. FRUIT-BEE, CORN, CLOTHES, AND FEATHER-WINGED MOTHS.

DARWIN'S NEW WORK.

THE VARIATION OF ANIMALS AND PLANTS

UNDER DOMESTICATION.

BY

CHARLES DARWIN, M.A., F.R.S., &c.

WITH A PREFACE

TO THE

AMERICAN EDITION

BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY.

IN TWO VOLUMES.

This work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, results of in-and-in breeding, crossing, etc.

It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS; FOWLS, DUCKS, GESE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, BUD VARIATION. INHERITANCE, REVERSION ON ATAVISM, CROSSING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTER-BREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.

Published in two Volumes of nearly 1100 pages.

FINELY ILLUSTRATED.

SENT POST-PAID.....PRICE \$6.00.

ORANGE JUDD & CO.,

245 Broadway, New York City.

NEW AND BEAUTIFUL WORK.

THE BOOK OF EVERGREENS.

BY

JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation, Description of Varieties and their Adaptability to Different Situations.

This is a long needed work, as in it the present state of our knowledge upon the cone-bearing plants, or Conifere, of the botanist, is posted up. Mr. Hoopes is one of those persons rarely met with—a practical cultivator, and a man of science at the same time. While his work gives us all the Conifere arranged in the classification of the botanist, it at the same time treats of the experience, not only of the author, but of American cultivators generally, with this large and important family of plants.

Evergreens play so interesting a part, not only in ornamental planting, but in what may be termed economical planting, (i. e. hedges, screens, wind-breaks, etc.), that we are sure a work which treats of their propagation and culture, describes in both popular and scientific language the many species, and, what is of not the least importance, gives a list of the tender and unreliable ones, will be warmly welcomed by every lover of these beautiful trees.

Mr. Hoopes brings to his work a perfect enthusiasm for his subject, and is as free to condemn a plant as if he were not a nurseryman. All the latest novelties from Japan, the North-west, etc., are noticed, and their success or failure, both in this country and in England, is recorded.

The work is abundantly illustrated with most carefully executed engravings, for the greater part from living specimens.

We must commend the conscientious care the author has shown in striving to arrive at the proper names; and doubtless much of confusion that at present exists in respect to names among both dealers and growers, will be corrected now that they have a standard work to refer to.

Not the least interesting portion of the book is an account of the principal collections of evergreens in the country.

The work is now ready. 433 pp., 12mo, on fine paper. SENT POST-PAID, - - - PRICE \$3.00.

ORANGE JUDD & Co.,

245 Broadway, New York City.

DIALOGUE.

Extract from Report of Farmers' Club.
WILLIAM D. OSBORN.—"Will the Club give us its opinion of Washing-machines? Is it economy to pay fourteen dollars for one of Doty's machines? Washing-machines have so generally proved to be failures that I am afraid of throwing away my money upon one."

SOLOMON ROBINSON.—"If you had to pay ten times the money you mention, it would be the best investment you ever made upon your farm. But you must not have that alone. Get the Universal Clothes-Wringer with it, and your wife and children will rise up and call you blessed, for they will find washing made easy."

The following testimonials have been given:
 "We like our machine much; could not be prevailed to do without it, and with the aid of Doty, we feel that we are masters of the position."—**REV. BISHOP SCOTT, M. E. CHURCH.**

"It is worth one dollar per week in any family."—**N. Y. TRIBUNE.**

"I give it the most unqualified praise, and pronounce it an indispensable part of the machinery of housekeeping."—**REV. HENRY BEECHER.**

"In the laundry of my house there is a perpetual thanksgiving on Monday for the invention of your excellent WRINGER."—**REV. THEODORE L. CUYLER.**

"Every week has given it a stranger hold upon the affections of the inmates of the laundry."—**NEW YORK OBSERVER.**

BOTH THESE MACHINES HAVE RECENTLY BEEN GREATLY IMPROVED.

You may prove the above statements true by sending the retail price: Washer, \$14; Extra Cog-Wheel Wringer, \$9; and we will forward to places where no one is selling, either or both, free of charges. If, after a trial of one month, you are not entirely satisfied, we will REFUND THE MONEY on the return of the machines. Large discount to the trade everywhere.

R. C. BROWNINC,
 General Agent,
 23 Cortlandt St., N. Y.

MY VINEYARD AT LAKEVIEW.

BY A WESTERN GRAPE GROWER.

A book full of valuable teachings to any one who wishes to grow grapes, whether a single vine or a vineyard.

Contents.—Making a Change. Going West. Getting Settled. First Experience. Planting a Vineyard. Soils and Situations. Preparation. Manures. Pruning and Training. Brief Expositions, etc.

SENT POST-PAID. PRICE, \$1.25.

ORANGE JUDD & CO. 245 Broadway.

CONANT'S BINDER.
 A cheap and durable method of binding Magazines, Papers, &c. Extensively used. New numbers can be added as received.

No. 1, Adapted to "Our Young Folks," and similar series of Journals, &c., \$1.00.
 No. 2, For Atlantic, Harper, Guley, &c., 50c.
 No. 3, For Riverside, Every Saturday, &c., 60c.
 No. 4, For Theological Journal, &c., 75c.
 No. 5, For Harper's Weekly, Scientific American, &c., \$1.25.
 This article is so simple, convenient, and useful, that we offer to the readers of the Agriculturist at the manufacturer's price. The cut shows the whole thing. All that has to be done is to punch six holes in the back of the paper with an awl, or any sharp instrument, slip the strings through, and tie them up. The book will then be bound, and the volume be preserved in good order to the end of the year for binding and future reference. Sent post-paid at above prices.

ORANGE JUDD & CO.,
 245 Broadway, New-York.

Wanted, Good Agents for our new work, "Home Book of Wonders" also for a new "Family Photo-graph Bible." Address A. BLAIRARD, Hartford, Conn.

DOLLAR MAGAZINE

FOR YOUNG MEN. PACKARD'S MONTHLY.

One Dollar a Year: Single Copies, 15 Cents.

The June number of this magazine is now ready, and can be had of Newsdealers, or at the office of Publication, 937 Broadway, New York.

It contains, among other matters of interest to the public, a spirited article (with portrait) on ROBERT HOSSER, and the New York Ledger, prepared with great care and discrimination, by OLIVER DYAN, Esq., and presenting points of interest in the career of the great journalist, never before made public; a well-considered article on SUCCESS OR FAILURE IN LIFE, by HORACE GREELLEY; a common-sense article from MR. PARTON, on CLERKS AND APPRENTICES; another from EDWARD CARL, of the Brooklyn Union, on the POLITICAL FUTURES OF YOUNG MEN; a spirited sketch on MONEY AND MORALS, by REV. J. L. CORNING, of Poughkeepsie; a most entertaining description of JOAN O'GROAR's, by ELIOT BURRITT, the "Learned Blacksmith;" a beautiful little poem on "THE TELESCOPE OF STARS," by GEO. W. BUNYAT; a Chapter on AUTOGRAPHS, by the Editor, embracing fine studies of the hand-writing of Rev. Henry Ward Beecher, Hon. Horace Greeley, Henry J. Raymond, Wm. Cullen Bryant, James Parton, Dr. J. G. Holland, Wm. E. Dodge, and George Wm. Curtis, etc.

It is the purpose of this Magazine to supply unexpensive reading for YOUNG MEN, by engaging the best talent, and putting the price at the very lowest point.

The unexpectedly favorable reception of the initial number (May) has inspired the publisher with a determination to leave nothing undone which may be requisite to place the magazine on a footing with the best examples of literature in the country. The desiring of this fulfillment will be apparent in the present number. Single copies sent on receipt of 15 cents. Excellent inducements for Clubs.

Wm. Packard
 Publisher, 937 Broadway, New York.

England's Improved Dirt Scraper.

Patented March 31st, 1868.

HENRY J. ENGLAND, Delhi, N. Y.

HOWE & STEVENS'

FAMILY DYE COLORS.

CAUTION.

ALL persons who keep HOWE & STEVENS' FAMILY DYE COLORS for sale can be relied on for fair dealing, for the reason that they cost the retailer twenty-five cents per dozen more than any other kind of Dyes now available. He retails them all at the same price; consequently he makes twenty-five cents per dozen more by selling an inferior article. We publish this caution to guard our customers against imposition. Accept none but HOWE & STEVENS' PATENT FAMILY DYE COLORS. They are the original inventors of an improvement which originated this branch of business, and made dyeing a domestic art. They have had, also, five years' experience in this particular business, and have been constantly improving the quality of their Dyes. All the colors, both in liquid and powder form, are manufactured by the water process, and our customers can depend on either. The liquids do not require so much time in dyeing; but the powder colors will color the most goods, and cost the same per package. Incorporating blacks, browns and drabs, we would advise the use of the powder colors in preference to the liquid, unless for ribbons or some very small article.

MANUFACTURED BY

MANLEY HOWE,

(Successor to Howe & Stevens.)

260 and 262 BROADWAY, BOSTON.

EVERY MAN HIS OWN PRINTER.

LUMBER AND LOG BOOK.

SCHREYER'S READY RECKONER, designed expressly for Lumber Merchants, Ship Builders and Farmers, containing the correct measurement of Scantling, Boards, Plank, "Solid" contents of Square Logs, Round Logs, Saw Logs, Wood, &c., comprised in a number of tables, to which are added Tables of Wages by the month, Board or Rent by the week or day, Interest Tables, &c.

Scarcely is it possible to add to the recommendations of the above book more than to give its title page. Every one engaged in buying, selling, measuring or erecting lumber of any kind, will at once appreciate a work of this kind.

400,000 COPIES

have now been sold, and it is considered the standard Lumber and Log Book of the country. No farmer or lumber dealer need hesitate to adopt the measurement given, as it is based upon mathematical calculations, and must necessarily be correct.

The book is for sale by booksellers generally throughout the United States, and sent post-paid to any address for 30 cents, by
 GEO. W. FISHER, Publisher,

AGENTS WANTED

—FOR—

"Mansfield's Life of Grant"

IN ENGLISH AND GERMAN.

Great inducements to Agents to sell the "Popular and Authentic Life of U. S. Grant," with steel Plates and Maps, and the noble pen of Hon. J. T. Headley. His high education, close study of history, long experience as editor and author, and powerful and graphic style, render his book of absorbing interest and perfect authenticity. The reputation alone will sell the book wherever offered. Applicants for territory west of Indiana will apply to R. G. Laubert, Bloomington, Ill. All others to the sole publishers,
 R. W. CARROLL & CO., Cincinnati, Ohio.

BOOK AGENTS WANTED FOR "PEOPLE'S BOOK OF BIOGRAPHY."
 BY JAMES PARTON, the "Prince of Biographers," containing lives of distinguished persons of all ages and countries. Women as well as Men! A handsome octavo book of over 600 pages, illustrated with 12 beautiful Steel Engravings. No competition. Agents say it sells faster than any book they ever sold. Terms liberal. Send for descriptive circular to
 A. S. HALE & CO., Hartford, Conn.

BOOK AGENTS WANTED, FOR HOWLAND'S LIFE OF GENERAL GRANT, BY A SOLDIER AND A STATESMAN. An accurate History of his Military and Civil Career. One large octavo vol. of 616 pages, finely illustrated. Agents will find this the Book to sell at the present time. The largest commission given. We employ no General Agents, and offer extra inducements to canvassers. Agents will see the advantage of dealing directly with the publisher. For circulars and terms, address
 J. B. BURR & CO., Publishers, Hartford, Conn.

Book Agents Wanted
 For new, splendidly illustrated, and very popular books. Special opportunities for LADY AGENTS. Address, for terms and particulars,
 W. A. APPLETON & CO., Publishers, New-York.

WANTED, Agents to sell Campaign Badges and Medals, GRANT BAKER, New-York ready now. Send 25cts. for samples. LANTHEAR & PERKY, 109 Bank-st., Cleveland, Ohio.

WANTED, GOOD AGENTS for our new Work, "Home Book of Wonders;" also, for the cheapest and best Photographic Bible, containing Indexes, Maps, Engravings, &c. Best terms given. A. Brainard, Hartford, Conn.

The Union Apple-paring Machine

is so constructed that
The Knife Pares going
both ways,

Thus saving time without in-
creasing the speed of the apple
the Machine.

It contains a less number of
parts than any other machine
in the market.
The gears are all connected
directly with each other, thereby
disparaging with the screw or
rod to connect them, and
which has always been liable to
moving the parts.
It is very neat, as will be
seen by the above cut.

It is very thorough in its construction.
It has a straight knife, consequently leaves the apple
smooth and handsome.
Great pains have been taken to perfect this machine in all
its parts, and it is warranted entirely satisfactory.
This is the fourth year of its sale.

Price per dozen, \$9.00. In lots of 10 dozen,
at \$8.50. In lots of 50 dozen at \$8.00.
IMPROVED (ALL IRON)

Paring, Coring, and Slicing Machine.

All the objections that have ever been brought against
the "Bay State" Paring, Coring, and Slicing Machine, are
entirely overcome in this improvement.

It is all iron, and with the clamp can be firmly held to the
table.

The slide will not slip out of the screw while in operation.
It takes only just time enough to pare and slice each apple
according to size, while in the "Bay State" it takes suffi-
cient time to pare the largest apple for each one.

It takes only three turns of the crank to pare, and only
four turns to pare, core, and slice an ordinary-sized apple.
It is all done at once, and leaves it in the best possible
shape for drying and cooking.

It being all iron, and consequently thoroughly connected,
it works easy.

Dried apple sells higher when sliced with this machine
than when quartered. It is only about one-half the size of the
"Bay State" Machine.

Our long experience with and constant demand for the
"Bay State" has induced us at great expense to invent and
perfect this now perfect Paring, Coring, and Slicing Machine,
and it is warranted as recommended.

Price per dozen, \$13.00. In lots of 10 dozen, at
\$12.50. In lots of 50 dozen, at \$12.00.

PEACH PARER.

The above cut represents a Peach Parer which has been
sold for several years.

The peach is held between the two forks, the large fork
turns the peach, the small one turns upon the rod like a
saw, when the peach is turned, and serves to hold up the
outer end of the peach. The stone in each peach prevents
the peach from being pushed on to one fork and held by
that alone.

The small fork is pushed up and back with the rod, the
cam in the center of the stand serving to hold it in place
while the peach is being paring. The knife is then drawn
over the peach, from left to right.

When peaches are sent it is better to hold the small fork
against the peach by gently pushing against the knob while
the peach is being pared, thereby dispensing with the use of
the small cam in the center of the stand.

The above machine is also superior for

PARING POTATOES,

and even when the potato is long and wilted, it works com-
pletely, the small or outer fork serving to hold up the outer
end of the potato while it is being pared. The knife upon this
machine is of a very superior shape for potatoes.

It is also a good apple-paring machine—the use of the small
or sliding fork being dispensed with.

Price per dozen, \$10.00. In lots of 10 dozen,
at \$9.50. 25 dozen at \$9.00.

Manufactured only by **D. H. WHITE-MORE,**
Successor to Whittemore Brothers,
Worcester, Mass.

CLARK, WILSON & CO., Agents,
81 Beekman-st., New York.

Choked or Bloating Cattle

relieved at once by the use of

CLUMP'S PATENT THROAT PIPE.

A new instrument, warranted to perform the work for
which it is made. Every cattle owner should have one.
Agents wanted. Liberal terms given. Address
CLUMP & ENERLE, New Haven, Conn.

THE AMERICAN SUBMERGED PUMP.

Patented Feb. 9, 1861.

and put together easily, and as it requires no packing, sel-

dom gets out of repair.
3d. *It Never Freezes.*—As no water remains in the pipe
when not in motion, there is no danger of freezing.

3d. These Pumps, being placed near the bottom of the well,
work with very little friction, as they are perfectly lubri-
cated, and always furnish the coldest and purest water.

4th. *Guaranteed.*—Being thoroughly galvanized, outside
and inside, they do not rust, and are unexcelled and brackish
taste to the water; hence, for well-pumps for family use,
the galvanized ones are recommended.

We are prepared to furnish the following list of Pumps,
either Iron, Galvanized or Brass, with printed directions for
putting them in. Pipe extra. In ordering pipe and pump
from the manufacturer or of agents, be particular to give the
exact depth of well to top of platform; pipe can then be
furnished the length required, so that any man observing
the directions sent can set a pump without trouble. Orders
for pumps promptly filled. Sent by express C. O. D.

No.	Gal.	Size of	Length of	Capacity,
in.	raised.	Cylinder.	Stroke.	per minute.
1	12	1 1/2	3 1/2	15 to 20 gals.

4	50	5 1/2	7	10 to 15 gals.
5	80	8 1/2	12	20 to 30 gals.

Pipe, Hose, and Complings required will be furnished at
the lowest price.

CLIPPER MOWER & REAPER.

This **ORIGINAL** and **UNRIVALLED** machine is manufac-
tured by **The Clipper Mower & Reaper Company,**
at their Works at **YONKERS, N. Y.,** where they have unsur-
passed facilities for the business. The Machine needs no en-
gine. Farmers throughout all sections of the country
who have used it, are ready and willing to testify to its great
superiority for all work, combining as it does, most
points of excellence than any machine yet made.

Its principal characteristics are:—**SIMPLICITY** of CON-
STRUCTION, **DURABILITY**, **EASE** OF DRAFT, and **PERFECT**
and **COMPLETENESS** of FINISH in ALL ITS PARTS.

These Machines are made of Four Sizes, to meet the
wants of any farmer, as follows:

No. 1. One-Horse machine (30 in. wheel, 4 feet swath).

No. 2. Two-Horse (light) 30 in. wheel, 4 feet swath.

No. 3. " " (medium) 30 in. wheel, 4 1/2 feet swath.

No. 4. " " (large) 30 in. wheel, 5 1/2 feet swath.

Made also as a Combined Mower and Reaper.

HYDRAULIC

COW-MILKER.

WANTED IMMEDIATELY.—All who are looking for busi-
ness to call and examine the **HYDRAULIC COW-MILKER.**
Pat. May 23, 1866, and Feb. 18, 1868. There never was a
patent issued from the Patent Office which has sold so readi-
ly as this. One hundred and sixty counties in which the
Company are now prepared to furnish the machines, have
been sold within thirty-five days, and many more engaged
by the most cautious and prudent business men. It is a sure
cure for aching hands and kicking cows. It milks the four
teats of a cow at once. It milks the calf-draws perfectly dry
in two to three minutes. It is operated by hand, dog,
or any other power. One man can attend to several ma-
chines, milking as many cows at once. It is simple, durable,
and self-adjusting. Will fit any cow. Milks three-headed
cows as well as any. Easily worked, but liable to get out
of order, and has proven by practical use to be more agree-
able to the cow than hand-milking. Call one and all and
pass your judgment upon the most important and valuable
invention of the 19th Century. A rare opportunity is now
offered to enterprising men, with force or social capital, to
make money, either by traveling or locating in city or coun-
try. **HYDRAULIC COW-MILKING MACHINE CO., No.**

THE WEEKLY SUN

Is prepared with great care especially for country subscribers. The news of the week, in every department, is condensed for it by experienced and skillful editors, so that its readers will be able to learn in a brief space of time, every event of importance that has happened in any part of the globe. A selection from the most interesting editorial articles of **THE DAILY SUN** will form one of its constant features, while the most instructive and entertaining miscellany will also occupy a large portion of its columns.

The features and fluctuations of the markets of cattle, produce, and general merchandise, will be accurately and carefully exhibited in our columns; and while **THE WEEKLY SUN** is thus especially adapted to fill a place occupied by no other of our journals as a

General Family Newspaper, it will also furnish accurate and fresh reports of all matters of importance to

THE AGRICULTURIST AND GARDENER.

This department is under the supervision of **ANDREW S. FULLER**, who will not only write on the subjects in question, but will also attend the meetings of the Farmers' Club, and will daguerreotype their proceedings for the benefit of our subscribers. We shall also glad to receive and print in this department of **THE SUN** the results of the practical experience of our readers in agriculture and horticulture. Communications on these topics may be addressed to the Agricultural Editor of **THE SUN**, New York City.

A Liberal Offer.

We have received the following note from Mr. FULLER, which speaks for itself:

To the Publisher of **THE SUN**.

Sir: One of the great pleasures of an editor is in knowing that his labors are appreciated by his readers.

I have taken a special charge of the Agricultural and Horticultural Department of **THE SUN**, I am desirous of ascertaining how many of its readers take a special interest in these subjects.

For the purpose of obtaining the desired information, I make the following proposition:

To every subscriber to **THE WEEKLY** or **SEMI-WEEKLY SUN**, who shall send with the full subscription price, before the 1st of May next, I will forward by mail, carefully packed, and postage paid, six root cuttings each of the Wilson's Early and Italian blackberries, of two good vines of the Concord grape. The one-year old plants of these new and most excellent blackberries are now being sold by our nurserymen at about \$1 to \$2 per dozen; and the cuttings which I offer will make equally as good plants the first season, besides affording stock for their further propagation.

I do not offer these cuttings or vines as a premium, but having a quantity on hand, which I know to be genuine, I tender them to the accidental readers of the **WEEKLY** and **SEMI-WEEKLY SUN**, as an earnest of my good will, and the pleasant relations which I hope to establish with them.

S. FULLER.

The price of **THE WEEKLY SUN** is fixed at

ONE DOLLAR A YEAR,

and while it is offered at this low rate, our friends will bear in mind that it is only by a very large subscription list that we can be enabled to derive from it anything like a fair compensation for the trouble and expense involved in its publication. It is true that it is printed upon a sheet of more convenient form and dimensions than most of the other general weekly newspapers of this country; but the very condensation and neat finishes, because it will come twice as quickly and easily accessible to every reader, are gained by manual care and labor on the part of its editors. It is comparatively easy to fill a big blank paper up with long and uninteresting articles, the work of condensation requires labor, talent, and continual watchfulness.

Twenty copies of **THE WEEKLY SUN** will be mailed to one address for \$17, and fifty copies for \$37.50, invariably in advance. Address **THE SUN**, New York City.

THE SEMI-WEEKLY SUN

Will be of the same size and general character as **THE WEEKLY**, but will have space for a greater variety of miscellaneous reading, and will furnish the news to its subscribers with great freshness, because it will come twice as quick instead of once only. Its subscription price will be only

TWO DOLLARS A YEAR,

which is the ordinary price of a New York weekly. We confidently recommend the edition of **THE SEMI-WEEKLY SUN** to all our friends in the country who wish to receive their paper more frequently than once a week, and keep themselves more freshly posted with regard to the news.

Subscriptions to **THE SEMI-WEEKLY SUN** will now be received; but the first number will not be issued until **THE FIRST WEEK IN APRIL**, as it is entirely a new paper; the editions of **THE SUN** having hitherto been Daily and Weekly only.

Clubs of ten Subscribers, who have their papers sent to one address, will receive **THE SEMI-WEEKLY SUN** on payment of \$18. Twenty copies will be sent to one address for \$35; and fifty copies for \$40, always in advance.

Address **THE SUN,**
New York City.

THE WEEKLY SUN and **AMERICAN AGRICULTURIST** will be furnished together for \$2.00.

THE SEMI-WEEKLY and **AGRICULTURIST** for \$3.00.

THE CHICAGO WEEKLY REPUBLICAN,

The best Weekly Newspaper published in the West, will be issued as a Campaign Paper from the meeting of the National Republican Convention, May 21st, to December 1st, for the

Very Low Price of 50 cents.

It will contain the fullest political intelligence, general news, commercial reports, choice selections of reading matter, and able editorials on all important current topics. It must command itself particularly to Republican Clubs and Campaign Committees as the clearest, most entertaining, and most effective campaign document issued. Every Republican should take it and see that his neighbor has it.

SEND IN YOUR ORDERS.

Address **REPUBLICAN CO.**, Chicago, Ill.

To Advertisers.

THE MIRROR AND FARMER, a weekly paper published at Manchester, N. H., is the leading **Farming and Family Paper** in the Eastern States. It is a quarto, about the size of the New York Weekly Tribune. Specimen copies sent free upon receipt of a two cent stamp to prepay postage. Terms of advertising—Ten cents for a line of square inch insertion. Twelve lines make an inch long. Twenty dollars per column single insertion.

JOHN B. CLARKE, Editor and Proprietor.

Journal of Agriculture.

A Weekly, Illustrated, Practical, Western paper. Subscription price, \$2.00 a year. Volume I. begins July 1st. It will be sent from June 1st to the close of the year, giving Vol. I. complete, with index, for one dollar. Try it. Specimens sent free. Address

WALLACE. 1,200 pages, illustrated with original Portraits, engraved on steel, of about 30 celebrated horses and Trotters. One vol. 8vo. cloth, gilt,\$10.00

A NEW WORK ON THE RIFLE. Edited by **THE CRACK SHOT**. By E. C. BARBER. Price \$2.00. Sent pre-paid on receipt of prices, by

W. A. TOWNSEND & ADAMS,
44 Broad-st., New York.

SEND FOR A COPY OF SWELLS' EVERY MAN HIS OWN LAWYER AND BUSINESS FORM BOOK.

It is a complete and reliable guide in all matters of law and business transactions for every State in the Union. It will save many times its cost in a twelvemonth.

The professional man, the farmer, the mechanic, the merchant, the manufacturer, each requires a convenient, comprehensive, and reliable work, which will enable him to draw up any instrument that may be required, and that will furnish him with all the information as to the law and custom in all his business relations of life—a book that everybody can understand, and that will enable every man or woman to be his or her own counsel.

The entire leading press of the country unqualifiedly indorses the work.

The work is published 12mo. size, 650 pages. Price, full leather binding, \$2.50; half library, \$2. Sent post-paid on receipt of prices.

Agents wanted everywhere. Address **B. W. HITCHCOCK, Publisher**, No. 38 Spring-st., N. Y.

HORACE GREELEY ON GRANT. ARE YOU OUT OF EMPLOYMENT?

Send at once and secure an Agency for **HEADLINE'S LIFE AND CAMPAIGNS OF GENERAL GRANT.**

With introduction by **HORACE GREELEY**. "It is the most complete, most popular, and best illustrated, and the most liberal terms given to agents, and is ready for sale."

Every family will need a copy of the Life and Public Services of the next President. If you want to make money easily and honestly, we advise you to address, for further particulars,

DERBY & MILLER, Publishers, No. 50 Duane-st., N. Y.

PROF. VILLE'S NEW SYSTEM OF AGRICULTURE. Pamphlet, price 25 cents. Address **JOHN H. RIDDLE**, Manchester, N. H. N. Y. Independent says of this work—"AGRICULTURAL CHEMISTRY, adapted to COMMON SENSE." Every farmer should have the work.

THE INDEPENDENT FOR \$1.

The N. Y. Independent

AND

THE LIBERAL CHRISTIAN

FOR

FOUR DOLLARS!

We have decided, for the next three months, to offer to every new subscriber to **THE LIBERAL CHRISTIAN** sending us \$1 extra (or \$4) a copy of the **N. Y. INDEPENDENT** for one year. These are two of the largest religious papers in the world, and cannot be had for less than \$3.50 a year when taken singly.

THE LIBERAL CHRISTIAN is acknowledged on all sides to be the freshest, spiciest, and ablest religious sheet published, price \$3 per year. The Independent is \$2.50 per year.

REV. H. W. BELLOW'S greatly admired **EUROPEAN LETTERS**, reprinted from the columns of

The Liberal Christian, are now in press by Messrs. HANMER & BROS., and will be issued in two large and handsome volumes. Price \$1.75 each.

The first volume is ready and will be delivered in a few days. Sent by mail to any address, post-paid, from this office, on receipt of price.

A MAGNIFICENT GIFT! In view of the great interest felt in these Letters, and the desire to get an early copy, we have made arrangements with Harpers, by which, for the next three months,

THE FIRST VOLUME OF DR. BELLOW'S LETTERS WILL BE PRESENTED TO

EVERY NEW SUBSCRIBER

to **THE LIBERAL CHRISTIAN** sending us 50 cents in addition to his \$3, and 25 cents to pay the balance of the work; or

BOTH VOLUMES Will be Given

For two new subscribers enclosing \$1 extra, and 50 cents to cover postage.

One new subscriber for two years in advance will be considered the same as two new subscribers.

THE LIBERAL CHRISTIAN, The N. Y. Independent,

(each for one year) and The First Volume of

DR. BELLOW'S LETTERS, Will be furnished for

FIVE DOLLARS!

And twenty-five cents additional to cover postage. These propositions are intended only for NEW subscribers, whose names have not been upon our books (or the books of *The Independent*) within the year, and they will remain open only for the space of three months.

The Liberal Christian

is not only one of

THE LARGEST AND MOST ATTRACTIVE In appearance, but is, upon all sides, acknowledged to be

THE MOST ABLY EDITED as it is, also, the **MOST EXPENSIVE**

RELIGIOUS JOURNAL IN THE WORLD!

It is not intended as a money-making institution; and however large its circulation or its receipts, **EVERY PENNY WILL BE EXPENDED IN PUSHING FORWARD THE WORK.** Let all understand and know that

We are in Earnest, and intend, by every practical and proper means in our power

To Push Forward the Work

AND

To Increase Our Usefulness.

We ask friends of religion and humanity, one and all, in Every Village, Hamlet and Town,

to take hold of the work and help us forward in the good cause.

Address **J. N. HIALLOCK, Manager,** 83 & 84 Nassau-street, New York.

OFFICE OF THE LIBERAL CHRISTIAN.

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

HAVE RECEIVED
TWO FULL CARCOES
OF THE FINEST NEW CROP TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyrae district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d. The Bunker makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 30 to 50 per cent. in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1000 to 2000 packages, at an average profit of about 10 per cent.

5th. The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these EIGHT profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of Clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OO LONG (Black), 70c, 80c, 90c., best \$1 75 lb.
MIXED, (Green and Black), 70c, 80c, 90c., best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c, 90c., \$1, \$1.10, best \$1.20 per pound.

IMPERIAL (Green), 80c, 90c., \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSOX (Green), 80c, 90c., \$1, \$1.10, best \$1.25 per pound.

UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 25c, 35c, 40c, best 40c. per pound.
Hotels, Saloons, Boarding-house Keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

ROASTED (Unground) 30c, 35c., best 40c. per lb.
GREEN (Unroasted) 25c, 30c., 35c., best 35c. per lb.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges), by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office Orders and Drafts, payable to the order of "Great American Tea Company." Direct letters and orders to the (as below, no more, no less)

Great American Tea Company,

Post-Office Box, 5,613, New York City.

A BOOK FOR EVERY FARMER. THE ELEMENTS OF AGRICULTURE

By GEO. E. WARING, JUNR.,

AUTHOR OF

DRAINING FOR PROFIT AND DRAIN- ING FOR HEALTH.

Formerly Agricultural Engineer of the Central Park, New-York. Revised Edition.

This book was first published about 15 years ago, and was more largely sold than any book of the same character ever brought out in America.

It has now been carefully revised in the light of the latest discoveries of Agricultural Science, and is cordially recommended to every farmer, young or old, who would understand the simple principles on which his success must depend.

It is written in a style that will be readily understood by all, and while necessarily referring to, and explaining, the chemical relations between the soil and the plant, there is the greatest possible avoidance of the use of Scientific terms.

In fact it may be regarded as a *translation* into the simplest English of much that, while it is of the greatest importance to the farmer, has hitherto been so clothed in technical language as to be practically inaccessible to him.

The chapters on Manures will be accepted by all as a clear statement of the principles which underlie the production and use of the most common fertilizers, and will be found most valuable to the practical farmer.

If a copy of this book could be placed in the hands of every farmer in the land it would add largely to the average crops of the whole country.

PRICE ONE DOLLAR.

Published and for sale at the office of

THE NEW YORK TRIBUNE.

* Sent by mail, postage paid, on receipt of price.

RURAL IMPROVEMENTS.

Robert Morris Copeland, author of Country Life, furnishes plans and advice for laying out Public and Private grounds of every description. Refers to John M. Forbes, Nathaniel Thayer, Boston, F. G. Shaw, New York, O. S. Hubbard, Philadelphia, G. T. Fletcher, Indianapolis, Ind.

FARMERS LOOK AT THIS.

An invention for hitching three horses to a plow—so there is no side draft. Thousands are in use on the prairies. Sure and simple. Single Clevis—sent by Express—free of charge, Price \$3. Liberal discount to the trade.

N. B.—Any infringement of Patent promptly prosecuted. For particulars address
G. H. GALE, Sec'y, THREE HORSE CLEVIS MFG. CO., Kalamazoo, Mich.

RAND'S PNEUMATIC GAS.

WARRANTED.

The Simplest, Safest, and Best Gas-Works in the World.

The gas made by these works is more uniform in quality than that made by any other known process.

The material used is supplied but once during the year, while all other apparatus used for making gas, such as are known as automatic machines, especially, have to be supplied as often as weekly, semi-weekly, or daily.

The works being outside, and entirely separate from the dwelling-house or building to be supplied with gas, servants and others have no occasion to approach them.

All machinery being entirely dispensed with, these gas works can never get out of order.

The gas can be made for less than one-half of the price of coal-gas.

Enough gas can be made in from five to thirty minutes to supply dwellings, hotels, and factories using from twenty-five to one thousand burners.

Accidents are impossible, as the tank holding the liquid is placed in the ground surrounded by water and covered with the iron gas-holder.

It is the only portable gas-works that insurance companies do not class as extra hazardous.

We guarantee our gas-works to give satisfaction. No skill is required to make this gas; a boy ten years old can make sufficient gas for ordinary dwellings in five minutes.

It is a clean, cheap, and convenient substitute for coal or wood to heat dwellings, and for all culinary operations, etc.

Those desiring further information will please send for descriptive circular to the Office of the Company, where working models may be seen.

A. C. RAND & CO.,
16 Nassau Street, New York.

Send for Descriptive Lists of our Goods.

No. 1. First Premium awarded these articles at the N. Y. State Fair, Buffalo, 1867.

No. 1 represents the interior working part of our new Block for Elevating Hay Forks or other articles, and carrying while elevated, over the great beam or other obstacles, and again lowering and discharging at any point desired.

No. 2 represents our new Pat. Grapple, with holder attached—by which *Pulley Blocks, Hoisting Tackle*, etc. can be put up or taken down without the aid of a ladder.

We also manufacture Wagon wheels and Boxes, Raymond's Pat. Hay Elevator, Wiles' Chinax Horse Hay Fork, Pat. Malleable Whiffletree Hooks, Miles' Pat. Wagon Stakes, and Bolster Plates, Pat. Metallic Button-holes for Carriage Trimmers, Pulley Blocks, &c. Address

KERRY CATTLE.—THE PROPERTY OF ANDREW H. GREEN, ESQ. ON EXHIBITION AT THE NEW YORK CENTRAL PARK.

The Kerry breed of cattle offer another example, like those of the Channel Islands, of a variety which has been formed by the urgent necessities of a people. County Kerry is a rude, rough, poor district in the southwestern extremity of Ireland. As an agricultural region it is primitive, isolated, and, in part, mountainous and sterile. Pushing out into the ocean, it not only forms a headland or breakwater against the warm Gulf Stream, but presents a bold front to all the storms of the Atlantic. This gives rise to that abundant moisture which

adapts the country to the growth of peat; and peat bogs alternate with rocky pastures, upon neither of which could ordinary cattle pick up a tolerable living—while at the same time, the climate is milder than that of any other portion of the British Islands. The poor people needed cows which would sustain themselves upon scanty fare, and give an abundance of good milk, and in the course of time this has been brought about. The Kerrys are very small, hardy, rugged cattle, not notable for symmetry, or any beauty but that of a picturesque rough-

ness; they yield an abundance of excellent milk, and make, properly fattened, very good beef.

Our engraving is a truthful representation of three animals of this breed, the property of Andrew H. Green, Esq., of this city, and now on exhibition at the Central Park. The stock was imported in 1864, the bull having just taken the prize of the Royal Agricultural Society of England. The herds of that mountainous district having been searched by an experienced breeder, with the object of securing the very

Farmers naturally feel greater solicitude in regard to the results which this month will effect than about those of any other similar period. And well they may. It is not farmers alone who are interested; every man, woman, and child, in the length and breadth of the land has a personal interest in abundant crops, well gathered. Upon no other thing does the prosperity of the whole country so much depend. The great bulk of the grass crop, which is more valuable than any other, the most of the wheat crop, and of all winter grains, are harvested in July. The character of the season settles the amount which will be realized from spring sown crops, and in fact most summer crops. Where droughts prevail this month they may almost, if not entirely, destroy the corn, potatoes, pastures, and aftermath. Protracted rains will cause great damage to grain and hay, not so much; standing grass will become tough and wiry, losing much of its nutritive value, and will fill up with a new growth, chiefly of clover, which is not really healthy when cured for hay. One of the most important things for us to do is to provide forage crops to take the place of short pastures in the fall. The corn sown in May will help out the feed this month. Every one ought to have a set of hay and grain crops as a defence against showers and storms. We should arrange good plans for quick work. When the weather is favorable, keep the soil among hoe crops always mellow, not working it so deep, however, in dry weather as to cause the crops to wilt. The progress of the age is shown more in the application of machinery and horse power to save the labor of human hands than in any other way, and it is essential to profitable farming, that, so far as possible, we avail ourselves of the most valuable helps. Smooth land is essential, if we would make the best use of haying and harvesting machinery. Clean land, that having a comparative freedom from weeds, is indispensable to the most advantageous use of horse power in tillage. Freedom from water standing within a few feet of the surface, accomplished by means of thorough drainage, is, perhaps, the most important means of making the tiller of the soil in a measure independent of both wet and dry seasons. For the ease and comfort of the farmer and his teams, and the durability of his implements a removal of the stones, so far as possible, is most important.

Hints about Work.

This is a month of hard work; haying presses upon haying, and this has to be neglected too often for the grain harvest. Then turnip and buckwheat sowing, cabbage setting, and a score of other necessary or desirable things fill every moment of the long days, and may cause sore perplexity if the plans are not well thought over for each day and for several days ahead.

Weather.—We expect hot weather, with some two or three weeks very hot and dry. We must be prepared to take advantage of a few rainy days early in the month to transplant cabbages, fill out tobacco, or vacant spots in the rows of ruta-bagas. Thunder storms must be looked out for, and hay and grain shielded from damage as well as possible.

Hay.—Cut, cure, and mow away by horse power if possible. Steady and rapid drying of the hay, as when the hay tedder tosses it up every few minutes until it is cured, is best; curing in the cock after having been twice turned, and cocked up while hot, next best, and makes better hay than that sunned and dried, and raked up after the dew falls, in the usual way. Cotton stuffs are cheap enough to make hay caps now, and they often pay for themselves in one rainy week. Upon shocks of

Grain, caps of cloth are very useful, as it takes no longer to put them on than to put on the cap sleeves. Cut when nearly ripe, and if the straw is short or dry, it saves time and labor to take to the field dampened, long rye straw for bands.

Pastures must be well looked to, and if they begin to get short, the cattle should be fed daily with green corn fodder, or other green feed. Top-dress with guano, ashes, plaster, or any fine compost.

Root Crops.—Ruta-bagas sown last month should be well hoed and thinned. Hoe other roots. Sow turnips any time during the month. A full crop of Ruta-bagas cannot be expected, but a very good one may be excellent for the table. Sow Strap-leaf or Cowhorn turnips only after the 25th. They will do well sown among corn at the last hosing.

Potatoes.—Keep weeds pulled; scatter turnip seed or set cabbage plants, when hills are wanting.

Corn.—Keep down the weeds with the plow and cultivator until the corn is too large; do as little hand-hoeing as possible, but pull the weeds close in by the hills, and work the rest of the ground by horse power. Sweet corn will mature "roasting ears," if sown as late as the 4th of July, and corn may be sown for green or dry fodder up to the 20th.

Stacks for hay, grain, and corn fodder, are best made long and narrow. For such, the horse-fork attached to a pair of large shears may be used.

Cabbages.—Set on rich land, where early potatoes, peas, etc., were taken off. Top-dress with lime, and water freely when first put out; when well established and beginning to grow, a few waterings at evening with liquid manure, (barn-yard lye) will give them a grand start, and do much towards securing a large crop. Hoe very frequently.

Buckwheat may be sown any time during the month. It is one of the most profitable crops we raise, occupying the ground but a very short time, doing fairly on land not in the best heart, and well on any land not enriched with rank manure and not too wet. It makes so dense a covering as to choke down all common weeds, and yields a very good return for the labor it requires, in grain and straw, which latter is a valuable addition to the manure heap. An old practice, rarely followed of late years, so far as we know, yet not to be overlooked, is the sowing of buckwheat as late as the last of this month or first week of August with wheat. This crop matures before frost, or not at all, and being removed the wheat has the ground the rest of the season and is not perceptibly injured.

Orchards.—It is often a problem what crops to put in an orchard, which should be tilled for the benefit of the trees. Potatoes seldom do well on a sod, and weeds will grow badly under the trees. Corn or grain should be out of the question, because they make their strong growth just when the trees do theirs, and are a serious damage. "No white crop in an orchard," is the old English rule. Potatoes, roots, cabbages, and clover, are beneficial. On rather light loams, the sward turned over flat, rolled, and harrowed so as not to tear the sod, buckwheat will make a fair crop. The soil will rot, the grass be kept under, and if the stubble be manured and plowed after the crop is off, the land will be in good condition for potatoes or root crops the next year if not too much shaded.

Manure Making.—If the weather be dry, employ every spare hour in ditching and draining swamp holes and mucky places, to get out a good supply of material for composts. All peaty matter, bog grasses, ferns and rushes, sods, wherever found, and in the absence of these, good surface soil, or even sand, ought to be freely used to compost with stable and yard manure. This is more important during the warm weather than at any other time. It is best to lay up the materials in compact rectangular heaps, having drainage secured under the whole bottom. The hog pens should be well supplied with weeds and green vegetable matters of all kinds, which they rapidly convert into manure. It is the saying of an old farmer: "Anything that grows in the summer will rot in the winter." This may not be exactly true, but sufficiently well indicates the kind of material to put into hog pens.

Animals.—All kind of animals do better for being well fed. Young stock grow much more rapidly for a little meal; oil-cake pottage is grand feed for hogs, and they need but little to keep them well growing. Bees ought to get grain in addition to

the best grass; they do much better for it, and it costs less to fit them for market. Be sure that there is no lack of water, and it is best to keep salt where all the stock can always get at it.

Weeds.—Maintain constant warfare; cut those in blossom, whenever seen, and throw them into the hog pen. Any that go to seed should be burned.

Irrigation.—This subject is constantly exciting more interest. It is especially valuable for the production of grass, though its application is by no means limited to forage plants. The great value of the hay crop naturally leads us to wish to double it. Wherever an opportunity occurs, turn a gentle stream of water upon fresh-mown grass land, and so distribute it that it shall trickle over as wide a surface as possible. Let it stay on a day or two at a time, and report the result.

Drainage.—The importance of drainage is only imperfectly understood. It is the best agency we can employ as a protection against protracted droughts. Those especially interested should read *Draining for Profit*, or that epitome of the subject in the *American Agricultural Annual for 1897*.

Work in the Horticultural Departments.

On a cold, wet day in June, it is not easy to write notes for July. The poor little boy in one of Reader's stories says: "Father, there wasn't any breakfast for breakfast." Thus far we have not had any June for June, but trusting that it will come out all right—as it always does—we make our notes usual for July in the full faith that warm and sunny days are in store for us.

Orchard and Nursery.

Thinning is so much neglected, and yet so important, that we must, at the risk of repetition, often insist upon it. If one has any doubts upon the subject, let him take two trees of the same variety of peach or pear, and from one remove half or three-fourths of the crop, and upon the other let all the fruit grow. When the fruit is ripe, market the crop of each tree, keeping a correct account of all the expenses, and see which tree has paid the most. One bushel of good fruit will bring more than three bushels of poor.

Peaches should be handled with care; pick just before they soften, so that they will reach market in good order. Crates are better than baskets.

Cherries.—When these—as is often the case—are "picked on shares," watch the pickers, who often do much damage. Allow no person with heavy boots to go into the trees, and if a picker picks fruit-spurs as well as fruit, make him stop his work.

Budding will commence with the plum and cherry, according to the season. Some hints upon the subject are given on a subsequent page.

Pruning is to be continued, and on young trees superfluous growths are to be rubbed off.

Insects are always to be fought. Sufficient directions for fighting them were given last month.

Black Knot on plum and cherry is to be cut out on its first appearance.

Cultivate young orchards as directed last month. **Mulch** around young trees, if this treatment is preferred to cultivation.

Cherry Stones are to be collected, and mixed with a plenty of sand before they dry up.

Fruit Garden.

Picking and Marketing of fruits was sufficiently discussed last month on page 224. Fruit sent to market must be picked in a "firmer" condition than that intended for home use. That which is to be used in the family may get "dead ripe" before it is gathered, and then it is improved by being cooled in the ice-box before it is eaten.

Blackberries are to be kept in check; pinch back the side shoots to 13 inches, and keep the whole growth compact and within control. The pinching should be attended to at least every two weeks.

Raspberries.—In garden culture it is best to prune out the old canes as soon as the fruit is off. Treat all suckers not needed for new plants like weeds.

Currants.—If a late brood of the worm appears, give a dusting of white hellebore. By shading a number of bushes, the season of this excellent, but much neglected fruit may be much prolonged.

Strawberries may be transplanted now, and the plants become sufficiently well established to give a crop next season.

Dwarf Trees in the fruit garden will need all the care with regard to insects mentioned for those in the orchard. Thinning is particularly recommended, especially with those pears that bear fruit in clusters. If the red spider appears upon pear trees, drench them with strong soap-suds.

Grape Vines will now need constant care. See what has been said upon summer treatment in the articles on the vine in this and previous numbers.

Kitchen Garden.

Asparagus.—Give a dressing of manure and let it grow. Fertilizing will do now better than at any other time. If the beetle appears, cut and burn. It is a quite small black beetle and a black grub. There is no help short of extermination.

Beans.—Plant bush sorts for succession, and pinch the Limas when they are six or seven feet high.

Beets.—Thin, and use the thinnings for "greens." A crop may be sown even at this late day.

Cabbages, Cauliflowers, and the related plants which have been sown in an open ground seed-bed, are to be transplanted. Keep well cultivated.

Celery.—Set the plants for the main crop in rows three feet apart, and the plants six inches distant. Plants set in trenches are to be gradually carted up.

Carrots.—Work between the rows until the size of the leaves prevents it.

Corn.—Put in a plenty for late use and to dry.

Egg Plant.—Manure, hoe, and coax in every possible manner. Do not let the fruit remain long in contact with the ground, or it will rot. A little straw or a shingle may be put under it.

Endive.—Sow and treat just like lettuce—only before it can be eaten it must be blanched either by tying up each plant separately, or placing a board over a whole row, to exclude the light.

Herbs.—Transplant from seed-bed to ground vacated by other plants, and keep well cultivated. Our market growers make two or three cuttings.

Melons.—Remove all the fruit that will not ripen.

Onions.—Keep free from weeds.

Peas.—Late sorts are sure to mildew. If a late sowing is tried, it is only as a venture.

Seeds.—If you have not the courage to save the best and earliest peas, cucumbers, tomatoes, etc., for seed, don't save seed at all. But if you would get better vegetables every year, save the earliest.

Sweet Potatoes.—At the North it is not advisable to allow the vines to root. Keep free from weeds.

Squashes.—Hand-picking is the only remedy we know of for the Squash-bug. Let the vines of the running sorts take root at the joints.

Tomatoes in some gardens are trained to trellises, but brush or anything that will keep the fruit from the ground is used in ordinary culture.

Weeds are always to be fought, and there is nothing better than a sharp steel rake with long teeth, and a good man at the end of the handle.

Flower Garden and Lawn.

Lawns need frequent cutting and rolling. Whenever perennial weeds appear, such as thistles, plantains, dandelions, etc., take them out while young. Keep the margins neatly cut, whether along a walk or road, or those of a bed cut in the lawn. What a carpet is to a parlor, a well-kept turf is to a place, large or small; it sets off everything else.

Neatness in all parts of the grounds is to be preserved by constant attention; see article on sticks, strings and wires, page 201. Daily care is needed.

As soon as plants have passed out of flower, cut away the flower stems, unless seeds are needed.

Climbers will need attention; those upon buildings should not be allowed to twine around water conductors. See that they are properly supported, so that a heavy wind will not bring them down.

Dahls.—The early blooming sorts, such as hyacinths and tulips, will now begin to ripen. As soon as the foliage begins to show by its wilting that the bulbs are maturing, take them up and lay them on their sides in a shady place until the foliage dries up; then store the bulbs until time to plant.

Lilies.—The Japan sorts are apt to be troubled by a worm, and need frequent inspection; keep well tied to stakes, to prevent breaking by winds.

Foliage Plants, like Coleus, should be made to grow bushy by cutting back. Where there are two or more colors, keep them from running together.

Annuals.—Quick growing ones may still be sown for a late bloom. Transplant the earlier sown ones.

Dahlias should now be making a good growth; keep well tied up, and water in dry weather.

Roses.—Give the new growth of climbing roses care in training. Use cresylic soap or some other insect-killing compound as soon as insects appear.

Perennials.—Sow in a reserve bed as soon as they ripen, and they will make plants for next year.

Green and Hot-Houses.

The plants left in the houses, even the tropical ones, must be shaded from our hot summer suns. The common custom is to wash the outside of the glass with common whitewash, or a mixture of whitening and glue water. Some use muslin screens. Proper attention must be given to watering, and insects carefully looked after. Green-house plants out of doors must not be neglected. They will often be blown over. Camellias and all broad-leaved evergreens must be shaded. Make all repairs the houses need, and put up new structures.

Cold Grapery.

The outside borders should be mulched, and weak liquid manure given. The shoots should have already been shortened to the third leaf from the last bunch. The temperature of the house should not exceed 90° to 95° at midday, and fall to 85° at night. Thinning the fruit on the bunches is now an important matter. Use the slender scissors made for the purpose. One-half, or more, according to the variety, is to be removed. At the first appearance of mildew, make the air of the house as dry as possible, and sprinkle sulphur abundantly.

Darwin on the Variation of Animals and Plants under Domestication.

Probably no work ever published in this country met with a more cordial appreciation. We published it, not as endorsing Mr. Darwin's views, but to give the opinion of so eminent a naturalist to the American public in an accessible form. The notices the work has had have been most favorable, even those journals who are opposed to Mr. Darwin's views giving praise to this remarkable record of facts. As a specimen of the reviews we give the following from the *N. Y. Horticulturist*: "Written in admirable English, using no scientific terms but such as are comprehensible to men of fair education, lucidly arranged, and indexed with scrupulous care, there is not an agriculturist or horticulturist in the country who has any taste for the history or theory of his calling but will peruse it with pleasure and profit, and find it difficult to say whether he values it more as a storehouse of facts or as an incitement to observe and to think. Let the reader be of the learned professions, or a child or novice in all that pertains to natural history, he will find in this book food for thought and instruction, knowledge of animal and vegetable life, their origin and perpetuation in a healthy or unhealthy condition, and so mingled with anecdotes, observations, and originality, that its study will be a pleasure to every intelligent mind. The work is finely illustrated, and published in two volumes of over 500 pages each. Price, \$6, post-paid."

Fowls Roosting on the Nest Boxes.

—W. C. Brown of Sing Sing, N. Y., prevents this by fixing common telegraph wire about an inch above the edges of the nest boxes, and finds it perfectly effectual, while the hens will readily cross the wire to lay.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 345 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.00 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

HALF A YEAR

On Trial.

This number begins the second half of the Volume, and the present is a favorable time for a large number of persons to begin a trial of the paper. We will this month receive six months' subscriptions from July to December, inclusive, at half the annual rates, viz. 75 cents each, or four copies \$2.50; or ten copies for \$6.00, that is, 60 cents each. Will our friends please mention this matter to their neighbors? There are many who are not ready, or not willing to venture a whole year's subscription to start with, who would be willing to try it half a year, if the idea were suggested to them. We trust there are very few who have not got their money's worth during the past six months. The last half of the volume will certainly be equal to the first half. We shall be happy to receive at least one addition for every present subscriber. A paper of this kind will be a good thing to fall back upon during the coming months, when political excitement will largely monopolize the general newspapers.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending June 13, 1868, and for the corresponding month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.									
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.	Butter.	Eggs.	Cheese.
25 days to June 13, 1868	1,356,000	57,000	2,652,000	61,000	71,000	667,000	35,000	35,000	92,000
25 days to June 13, 1867	1,356,000	57,000	2,652,000	61,000	71,000	667,000	35,000	35,000	92,000
2. Comparison with corresponding month at this time last year.									
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.	Butter.	Eggs.	Cheese.
25 days to June 13, 1868	1,356,000	57,000	2,652,000	61,000	71,000	667,000	35,000	35,000	92,000
25 days to June 13, 1867	1,356,000	57,000	2,652,000	61,000	71,000	667,000	35,000	35,000	92,000
3. Exports from New York, Jan. 1 to June 13:									
Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.	Butter.	Eggs.	Cheese.	
1868.	403,500	2,500,000	5,500,000	150,000	250,000	2,500,000	100,000	100,000	250,000
1867.	403,500	2,500,000	5,500,000	150,000	250,000	2,500,000	100,000	100,000	250,000
1866.	403,500	2,500,000	5,500,000	150,000	250,000	2,500,000	100,000	100,000	250,000
1865.	403,500	2,500,000	5,500,000	150,000	250,000	2,500,000	100,000	100,000	250,000

4. Stock of grain in store of New York:									
1868.	Wheat.	Flour.	Corn.	Rye.	Barley.	Oats.	Butter.	Eggs.	Cheese.
June 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
May 12.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Apr. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Mar. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Feb. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Jan. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
1867.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Dec. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Nov. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Oct. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Sept. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Aug. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
July 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
June 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
May 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Apr. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Mar. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Feb. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			
Jan. 10.	1,255,277	1,335,171	51,469	575	527,054	11,505			

5. Receipts at head of tide water at Albany, each season to June 30:									
Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.	Butter.	Eggs.	Cheese.	
1868.	6,570	2,652,000	3,557,400	119,000	280,000	3,500,000	100,000	100,000	250,000
1867.	6,570	2,652,000	3,557,400	119,000	280,000	3,500,000	100,000	100,000	250,000
1866.	6,570	2,652,000	3,557,400	119,000	280,000	3,500,000	100,000	100,000	250,000
1865.	6,570	2,652,000	3,557,400	119,000	280,000	3,500,000	100,000	100,000	250,000

Gold has been comparatively uniform in price, most of the month. The dealings in it have been on a moderate scale. The latest quotation was 140....There has been

less activity in the line of Broadstuffs, which have been more freely offered; and, under less favorable advices from Europe, prices have been depressed, closing generally in favor of buyers. The transactions of the past week have been unusually light....The Provision trade has been very dull, though prices have declined materially. Some speculative activity was noticeable in Lard, early in the month, but it has subsided. Butter and Cheese have been particularly tame, and, as lower prices are looked for, especially by exporters, there is little disposition to make free purchases at prevailing rates....Cotton has been very dull all the month, closing quite heavily, with a downward tendency....The demand for Wool has been very moderate, and prices have been depressed. The offerings have been comparatively light, but holders have been willing sellers....Seeds have been in moderate supply and limited request at drooping rates....Hay and Tobacco have been fairly active and rather firm....Hops have been quite nominal in price.

CURRENT WHOLESALE PRICES.

	May 14.	June 13.
Price of Gold	139.70	140

important part in the decoration of our homes and in the shielding of them, as well as our orchards, from harsh, cold winds and storms. In both popular and scientific language the author describes the many species, and treats practically of their propagation, their hardiness, etc., in such a manner as cannot fail to make the work a necessity to every planter. Botanically we have long felt the want of just such a work as is here presented, and are thankful to the author for the care he has evidently taken in striving to arrive at correct names. The book is gotten up in the usual good style of its publishers, is abundantly illustrated with engravings, executed in a very superior manner, and cannot fail to take its appropriate place as a standard of authority on evergreens for this country. Price, \$3."

Aquarium.—S. M. Baleman, Va.—If properly constructed, the aquarium needs no change of water. The plants supply what the animals need, the animals help support the plants, and the water is kept in healthful balance by the two. The skill of the operator is shown in hitting this balance and in keeping the water always transparent and sweet. Rain water is the best to use in starting a fresh water aquarium. The size of the tank must determine the number of animals and plants that can be kept in it. Begin small, and determine by experiment what can be added. It furnishes a very interesting study, but it is quite impossible to teach the art by books. Aquariums are also made with salt water. See articles in the *Agriculturist* for Sept., 1896; May and Oct., 1897.

Range for Fowls.—"S. C.," Hudson, N. Y. Most dwellers in towns fail to give their hens room enough. A flock of a dozen ought to have a half acre, and half of this in grass, in order to gain the best results in breeding. They will lay some for a time, in confinement, but they will inevitably run down. Breeders for sale, especially, should be conscientious in giving their fowls plenty of range. The roosts should be well ventilated, and kept scrupulously clean.

Breeding from Young Fowls.—"J. V. M.," Barreget, N. J. The flock will run down in size and vigor, if this is followed habitually. Pullets lay more eggs than old hens, but they do not lay so large ones, or make so good mothers. The cock should be two or more years old, and the hens at least two years old, for breeding. A rooster from another flock should be introduced every other year.

Poultry on a Large Scale.—"A. K.," Tiverton, R. I.—We have read some very interesting romances upon this subject, but have never seen a case of success. We do know of failures. Because a farmer with ample room can keep twenty hens, and raise two hundred chickens, it does not follow that he can keep two hundred hens and raise two thousand chickens on the same ground, or on ten times the space. The figures mislead some people, and many learn, at great expense for tuition, that a few hens pay, and many do not.

Training Turkeys.—"H. H. C.," Kingston, Pa. The attachment of these birds to their roosting places is not quite so strong as that of hens, but they have very strong memories of their feeding places. One of the best roosts they can have is a large pole, raised ten or twelve feet from the ground on crooked sticks. If the young flock is trained to roost on this, as soon as they are large enough to leave the mother's wings, they will seek it of their own accord. They should be regularly sought at night, and fed, and driven to one roost.

Cure for Gapes in Chickens. By A. L. Phoebus, Md.—Turpentine and goose-oil, mixed, rubbed on the wings and breast of the hen just before the chickens go to roost, is good for the gapes.

Standard Weight of Poultry.—"W. N. D.," Rochester, N. Y. We are not aware that any society, which offers premiums for poultry, has adopted any standard of weight for prize fowls. This is especially desirable in the birds that are raised for their flesh. We notice in a recent issue in England a pair of turkeys that weighed 50 lbs.; a pair of white geese 54½ lbs.; White Aylesbury ducks 18½ lbs.; Roman 19½. We like the suggestion, and commend it to the notice of all the Agricultural Societies. Birds that do not come up to some adopted standard should not have premiums.

The Percheron Horse.—Translated from the French of Charles Du Hays, author of numerous popular works on the horse. Illustrated, 100 pages, 12mo. Orange Judd & Co., 1898. Price, \$1.00.—The work is a report made to the French Government upon the breeding and rearing of this admirable breed of

draft horses. The demand for the Percherons, both for breeding and for labor, has been so great of late, that a well-grounded anxiety existed lest the district should lose its famous and valuable breed of horses, being tempted by present gain to hazard its future prosperity. This book is written with the view of indicating how to defend the race against degenerating, to improve it in all its estimable qualities, and at the same time to enable the breeders of Perche to supply the ever hungry market. It discusses principles applicable to the breeding of work horses, that is, any horses except race horses and hunters. Interest in the Percheron has greatly increased in the United States as the breed has become better known, and every new importation adds to it, and to the firm friends of the breed. The book is arranged in three parts, namely: 1. The excellencies of the Percherons and their decline. 2. The means of bringing up the breed. 3. Information to strangers visiting Perche. It is illustrated with several fine engravings of horses and manes recently imported by Mr. W. T. Walters, of Baltimore.

Agriculture of Massachusetts. By C. L. Flint—1867—8.—The volume is made up of the Secretary's report of the discussions at the meetings of the Board of Agriculture and of the abstracts of returns from the agricultural societies. It embraces a wide range of topics, and shows the steady progress of agriculture and horticulture in the Old Bay State. The leading men of the State give much of their time to the promotion of these interests, and it is owing to their influence that so much has been accomplished on a hard soil, and in a climate that is often discouraging to the hopes of the husbandman. One of the interesting topics discussed is Prof. Vail's experiments upon the imperial farm at Vincennes, who thinks he has proved after ten years of observation that cereals prefer manure, *nitrogen*; in leguminous plants, *potash*; the roots, *phosphorus*; in preparing a specific manure for these crops respectively, he would have the preferred article in much the largest quantity. He would add lime, which humus renders assimilable by plants. The volume is got up in the usual good style of the State Printers, Wright & Potter.

Trout Spaw.—"H. K.," Groton Centre, Ct. The trade in fertilized spawn is in very few hands, and, we think, is on too small a scale to promise sudden fortunes to any one. It will probably be a paying business, in a few years, to the men who have a sportsman's taste, and the requisite skill and patience to develop it. At present the fertilized spawn sells for ten dollars a thousand, and forty dollars a thousand, delivered at the depot nearest to the purchaser. A full-grown trout has from four to five thousand eggs. It will probably be cheaper to buy the trout to stock your pond than to attempt the rather difficult task of raising them yourself.

Summer Hatched Chickens.—"R. D.," Babylon, L. I. We have never succeeded very well with July and August chickens. They do better in September. But if a clutch comes out in summer, put the coop under the shade of trees, or in the edge of a patch of corn, where they will be screened from the sun. The critical time with them is the first month.

Warts on Cows' Teats.—This nuisance may be abated when the cow is dry more easily than when she is giving milk. Small warts may, however, often be removed by some simple application, which will give little or no pain. Moistening them after milking with strong saleratus water, applying a paste of wood ashes to the warts only, or touching them with almost any caustic in a way not to make them sore, will usually, but gradually, cause the warts to disappear. Very large warts should be first tied off, that is, have a wire or silk thread bound around them close to the teat, so as to prevent a circulation of blood; but this makes the teat sore and milking difficult. "N. C. B." writes that raw linsed oil applied once a week will cure warts on cows.

Lime on Yard Manure.—C. C. Moore, Chester Co., Pa., asks: "What will be the effect of lime on barn-yard manure which I had spread previous to plowing under?" We answer, if the effect be, on the whole, good, it would surely have been better if the lime had been applied after plowing under the manure. Lime in contact with manures containing ammonia takes the place of the ammonia in its combinations, and the volatile alkali is free to go with the blowing wind where it listeth. In this case, doubtless a portion of the small quantity of ammonia in the manure would be disengaged, but unless the lime were to remain in contact with the manure a considerable length of time, there would not be much ammonia lost. One hundred pounds of common yard manure will contain one to two per cent of ammonia,

which is considered as worth about 20 cents a pound. The loss of one quarter of the ammonia would be equivalent to 5 to 10 cents on each 100 lbs.—or \$1. to \$2 per ton, estimated at the market price of concentrated fertilizers, which is fair.

Bone Mill Wanted.—"E. H. C.," writes: "I have searched the advertising pages in vain for a cheap, effective, and durable bone mill. Is there any thing of the kind? I can get many tons of dry bones for the gathering, and I need the nitrogen that is in them more than anything else in my soil. I want to reduce the bones to fine flour before using them, that the good that is in them may be made immediately available." Mr. C.'s want is very much like that of many others, and if no such mill exists, one ought to be invented.

Profits of Farming.—"A. C. T.," Worcester County, Mass. If the average profits are less than five per cent, it does not follow that the same men would do better by changing their business. There is more unskilled labor upon the farm than in any other calling, and that kind of labor has a hard time in any business. If some men make but two per cent by farming, others make eight on their capital and furnish themselves and their sons with remunerative employment all the while, which is one of the great advantages of farming. The remedy for unsuccessful farming is not a change of business, but a change of policy. Knowledge and skill pay as well on the farms as in the workshop or counting room.

Sour Milk for Hens.—Mr. Affleck says: "The very best food for young chickens and turkey poults, is sour milk curd, or clabber, boiled until tolerably hard, and the whey separates entirely. Mix with corn meal or 'little hominy.'"

China-tree Fences, etc.—Mr. Affleck of Texas writes: "I thought my experience and observation in live fences was tolerably complete, and especially in the South. Fences may be made in the manner proposed, (alluding to the article on this subject on page 19, Jan. No.) but I have never seen any that deserved the name. On the beautiful Bayou Rapides was a long string of capital fence, of living posts—china-trees 15 to 18 inches through—with cypress rails let in between. As it lay in the track of armies, it is probably now destroyed."

Sundry Humbugs.—"The Riverside Drawing Association,"—J. F. Jones, and their Sewing Machines, are not to be added to the number given. We looked up the place indicated by the circular, and found a low grog-shop where several persons were engaged in a gambling game. If anyone sends money to such a place as this, he does it at the risk of never hearing from it again. . . . Wright, Bro. & Co., although repeatedly closed by the police, are still "on the make." The last investigation resulted in the arrest of one A. A. Kelly, of Kelly's Weekly, it being alleged that he was the prime mover in "Wright, Bro. & Co." . . . The Washington Library Co., in aid of Soldiers' Orphans, N. S. Read, Sec'y, under the management of Geo. A. Cook & Co., Bankers, No. 6 Clinton Hall, N. Y., has been spoken of before in these columns. Geo. A. Cook & Co., some weeks since retired probably "behind the scenes," and Read & Co. took up the business and are flooding the country with notices of prizes drawn. If questioned about the business they claim only to be receivers and bankers for said Washington Library Co., and give but little satisfaction. We have visited their "Banking House," and learned from them that by addressing A. J. Peters, 42 South Third-st., Philadelphia, the alleged responsible party, we could learn what prize belonged to our number, and then if we would deposit the money with them, they would order the prize sent. Accordingly we dropped Mr. Peters a letter, and here is the reply. "In answer to yours we will state that your premium is a house-lot, valued at \$200. By paying the percentage of \$10, to the receivers, Read & Co., No. 6 Clinton Hall, New York, a deed will be made out properly acknowledged, and sent in any name and to any address you may desire." Now, that is all very nice, and a house-lot is a good thing to have, but we failed to learn where the lot is located. It may be on Barreget Beach, or on the top of the Rocky Mountains, and in either case not worth ten cents to anybody. One number we know of is for a deed of a house-lot in an unincorporated town in California. These may be very nice lots—on paper—but with our present knowledge, we advise all persons to shun any investment with any party belonging to or having any connection with Read & Co., or the Washington Library Co. . . . Look out for H. Ballou Carter, in New Hampshire, and his "Automatic Needle-Threeder," which is no needle-threeder at all, but an enticing notice in regard to "Greubach's," and more information guaranteed if one will only send him his address in full, and a three-cent stamp for reply. The "reply"

is two circulars, making great offers of counterfeit money, well executed, in lots of ones, V's, and X's, at \$5.00 per parcel. The object is to get the \$5 out of the foolish and heedless, and we need only warn them of the wickedness of the transaction, and the facts in the case. . . . We know nothing of Jewelry Peddlers "with black horses" and "covered wagons," but advise all persons if they want silver-ware of any kind, or knives and forks, cotton or woolen fabrics, to send to some reliable firm in the nearest city, for every thing of the kind they fail to find at home. Such things always have a fixed value, and great bargains are not to be had from peddlers. . . . Look out for Nursery Agents who come around to sell plants, nursery stock, &c. Every year we have complaints from victims to this class of swindlers. Also, don't invest in patent rights of any kind, especially hay-loaders, and other farm appliances. Nine out of every ten are worthless. Also look out for the Electric Insurance Co., and their lightning rods. . . . Is anybody so verdant as to believe that Bally, Snyder & Co., will, for \$2.40, send 20 yards of Brussels Carpeting, simply because a man pays a \$3 annual subscription to the "World at Home," and besides this, send every month a sealed order or check entitling the subscriber to from \$2.75 to \$100 worth of goods, clothing, musical instruments, etc., etc.—the only conditions being that the recipient shall show the goods and tell where they came from. The following from the N. Y. Tribune, June 12th, shows that respectable men sometimes aid swindlers. "An esteemed correspondent, who is in a position that enables him to know whereof he affirms, as-ures us that highly respectable merchants are unwittingly standing between the authorities and the 'gift enterprise' swindlers. For example, the New York Post-Office, which was recently authorized to detain letters addressed to spurious gift jewelry firms, denied the mythical firm of 'George A. Cooke & Co.' the privilege of a box in the General Post-Office building, and thereafter letters addressed to George A. Cooke & Co. were held by the Post-master, who might in this way have done much toward the breaking up of Cooke & Co.'s 'Reversible Ophian Institution' fraud. But at length Cooke & Co. threw dust into the eyes of the highly respectable banking firm of Smith, Randolph & Co., and secured from them a letter recognizing George A. Cooke & Co.—a letter which disarmed the Post-master, and compelled him to surrender the letters that he had detained. The next that was heard of George A. Cooke & Co. was in Essex Market Police Court, where a simple-minded Pennsylvanian, who had been victimized, told the old story of a lottery swindle. The public have a right to expect of our merchants that they shall know to what papers they affix their names." Perhaps this will account for the disappearance of Geo. A. Cooke & Co., as stated, and the coming forward of Read & Co.

Catalogues.—Dealers in plants, seeds, etc., have sent their catalogues and circulars so numerously that we find it inconvenient just now to make individual acknowledgments. The documents will, however, have their use when we prepare our Annuals.

The Squash-Vine Borer.—A friend writes that covering the stem of the vine—layering it—up to the first blossom buds, prevents damage by the borer.

The Weather and the Crops.—The season thus far has exhibited too close a similarity to the last, so far as regards the Atlantic Coast, to allow farmers to feel very confident of good crops. The prevalence of exceedingly wet weather has caused even potatoes to fail, in a measure, has necessitated the replanting of much corn, and has delayed plowing of many fields intended for corn, until so late that a crop is despaired of. In our immediate neighborhood, where corn is generally planted before the 20th of May, we know of much not gotten in until between the 1st and 15th of June. Grass promises well everywhere, so far as we hear, and winter grains have been benefited by the wet weather. If upon well-drained ground. Similar complaints of the prevalence of excessive moisture come from the upper Mississippi Valley, and Central Illinois, some of the farmers there complaining of their utter inability to get grain to market, on account of the state of the roads and of the unfavorable agricultural prospects caused by excessive rains. The intermediate country seems to be blessed with fine weather, and everything promises a favorable season.

Culture and Products of the Vine in Europe.—Messrs. Marshall P. Wilder, Alex. Thompson, William J. Flagg, and Patrick Barry, were a committee of the U. S. Commission to the Paris Exposition to report upon the vine and its products. Their report is published in the Monthly Report of the Dept. of Agriculture for March. These gentlemen visited the celebrated vine districts, and give an interesting account

of what they saw. Vine growers can doubtless obtain this report by applying to Commissioner Capron.

Barn-Yards in Summer.—"E. H. A." Hadley, Mass.—The yard should be supplied with fresh sods, loam, peat, or manure, as soon as it is cleaned out. There is great temptation to neglect this, in the hurry of summer work; but every farmer loses money rapidly, who neglects it. Cart into the yard anything that will make an absorbent—weeds, saw-dust, corn stalks, hay, and swamp grass. Plow the yard frequently.

Shade-trees in Pastures.—"A. S. D.," Colechester, Vt. "Ought they to be cut down?" Not if you are a man of taste or humanity. There are good farmers who advocate treeless pastures, and think it better for the cattle to rest only at night. We think otherwise. The art of making cattle profitable lies mainly in keeping them comfortable. They seek the shade, enjoy it, and thrive under it. Let them have it, and beautify the landscape with clumps of trees.

Apple Worms.—"G. H. N.," Gaines, N. Y. We have never found any remedy so effectual as to keep hogs in the orchard, to pick up the fruit as fast as it falls. The moth lays its eggs in the blossom end of the apple when it is small, and the fruit ripens prematurely. If the injured apples are all gathered by the swine, or otherwise, the worms will be kept in check.

The Best Time to Cut Grass.—"J. D.," Orleans County. Cut the grass when in bloom, whether it be Timothy, clover, or red-top. This is the best usage, followed in all the States, and is as well settled as any fact in agriculture. We may not be able to state just how much better the hay is, but the difference will justify any reasonable extra labor, to cut the grass at the right time. Hay made a month out of date is poor stuff.

Cotton Seed Cake and Oil.—"M. S.," Charleston, S. C. We know of no objection to your making oil and cake in your city. The demand for the oil and cake is steadily increasing, both in this country and in England. The oil is quoted in the Liverpool market at \$1.17 a gallon currency, and the cake \$12½ a ton, gold. All that is wanted is the machinery, capital, and the requisite knowledge, to make the business pay.

Action of Gypsum.—Marius Heighon of Ohio asks: "Will you please tell me through the *Agriculturist* if plaster or gypsum acts as a stimulant on the land? Some say it acts upon the land as whiskey upon man." Gypsum acts upon the plant, rather than on the land, as lime may be said to do. It is stimulating, inasmuch as it promotes especially in some plants a healthy and vigorous growth. It does not stimulate like whiskey in any sense, for plants stimulated by gypsum exhibit only a healthy growth—strength to send their roots farther and deeper, to mature more seed. Marius adds: "I have 14 acres of land too far off to haul barnyard manure upon it; 5 acres of this is planted with apples, and I need a fertilizer." Your case is simple. Sow clover on a well-mowed soil, and top-dress with gypsum. The clover will make a tolerable stand next year and might be turned under, but it would be much better to wait. Feed it off with beef cattle or sheep once or twice, not allowing it to be bitten down too close, and next season turn it under, applying a good top-dressing of lime, after plowing.

Woodward's Record of Horticulture, No. 2. Edited by Andrew S. Fuller. In this volume Mr. Fuller reviews books, proceedings of societies, fruits, trees, plants, implements, etc., in his characteristically independent style. It is lively reading, and while it bears the marks of hasty preparation, it contains much that is valuable to the amateur or professional horticulturist. A very complete horticultural directory adds much to the value of the work. Sent by mail for \$1.00.

Drying Fruit.—There are several "Patent" fruit drying houses sold by the dealers in agricultural wares. We gave in June 1896, an easily constructed drying house, and in July 1897, a more complicated one. All that is needed is a contrivance for passing a current of hot air over the fruit. Any one of the least mechanical tact can contrive the means for effecting this. The house of which we gave the plan in June 1896 is easily built and will dry a large quantity of fruit very rapidly.

The Strawberry Crop.—We go to press too early to be able to print a general account of the strawberry crop. Our western exchanges give very melancholy news. The *Prairie Farmer* says: "From

all parts we get news of a poor strawberry crop." Coleman's Rural World says that in Southern Illinois, "There is not half a crop." The continued rains at the East are having a most disastrous effect on the fruit, and at the present writing, it looks like a failure in all parts.

Thunder and Lightning.—The season of thunder storms is at hand, and as the security which a good lightning rod furnishes, though not complete, is nevertheless considerable, and thoroughly established, the time is an appropriate one for us to correct an error which occurred when we described that model New England barn, built by David Lyman of Middlefield, Conn. Mr. Lyman's judgment in these practical things is excellent, and after he had thoroughly examined both the principles and the mode of construction of the various patterns of lightning rods, he adopted the Otis Patent rod as the best, and with this the famous barn is protected. It seems, going by contraries, that the name of the rod he liked the least was running in his mind, and he gave us thus the wrong name, believing his own judgment, and discrediting his favorite rod. So at his request we set the matter right with our readers. The rod approved by Franklin was a large rod of iron, capable of carrying an ordinary discharge safely to the ground. This was armed with three or more points at the top, which tended to draw off light charges gradually, but heavy ones were frequently carried down visibly, tearing the earth at the point where the rod entered—or, impatient of being confined to so narrow a road, they left the rod, took their own destructive way to the ground. The present approved plan, is, perfectly insulated rods, having several single incorrodible points at different parts of the house, to attract and quietly draw off the electricity, so that there shall be no flash of lightning perceptible. All rods should descend into the soil to a point constantly moist.

Prolific Sow.—James Bell, of Blooming-ton, has a sow that farrowed a few weeks since, dropping 19 pigs, which, when we saw them, were 4 weeks old and doing well. She can take care of but twelve.

Hard Milkers.—If the hard milking is due to a peculiar closeness of the end of the teat, the practice of inserting a steel wire hammered flat, about a quarter of an inch from the end, and the edges ground sharp, is sometimes followed with good results. This is thrust an inch or so into the teat once or twice, and a small quill with a closed end put in and left a few hours. The operation should be very carefully conducted, so as to do no injury. There is occasion for something of the kind being done when one teat alone milks hard.

Canning Apples.—Aunt Prudence says it is no more trouble than to dry them. They are nicer and ready for use without soaking. They are a tip-top article, and no one need cry for peaches, with the store-room well stocked with canned apples.

A Tin Strainer.—Aunt Prudence says every housekeeper should have one for gravies, hops, and many other uses. Any tin and sheet iron worker can make one. A basin 8 inches in diameter and 3 inches deep is a convenient size. Put in a strainer bottom and a firm handle, and it is ready for use.

Corn in Drills for Fodder.—"H. G. T.," Bricksburg, N. J. It may be less trouble to sow broadcast, but not nearly as much fodder will be yielded to the acre, and it is not so easily cured, if it is not all wanted in the green state. If the soil is not in high condition, it should be well manured. Sow in drills three and a half feet apart, about forty kernels to the foot, and cultivate every week until the corn spindles. It is a great safeguard against a drought in the pasture, and an excellent fodder for all kinds of farm stock.

Mass. Agricultural College.—This young institution seems to have gotten bravely over the dangers of infancy, and to be rejoicing already in a sturdy youth. The fifth annual report gives the names of 56 students. The course of study appears very judicious. President Clark and his assistants are obviously men to succeed. The report is accompanied by photographs of several of the new buildings—the Dormitory, Laboratory, Botanic Museum, and Duffee plant houses—exhibiting different styles of architecture, and a little of the surrounding grounds.

The Fair of the N. E. Agricultural Society is to be held this year during the first week of September in the city of New Haven, Conn. New Haven is easy of access to most parts of New England, and close enough to New York to attract both exhibitors and spectators, and the city and its surroundings offer many attractions aside from the fair. We congratulate the society on this choice of a location.

Keeping Good Bulls.—Bulls are not very expensive animals to keep. They should begin to earn their living as breeders when eighteen months old, and from about the same time may be worked to good advantage, as steadily as the farm horses. Let them draw in single harness by a padded stick across the forehead, to which chain or rope traces are attached—back strap and breeching, if necessary, being simple and strong. Charge, of course, only full-blood bulls of some sort. Charge not less than \$5 for service. Your neighbors will say it is too much. Never mind. If they say they would pay it willingly could they be sure of heifer calves, tell them you will give them \$3 each for their bull calves at three days old. We know of this plan being followed to the great benefit of the stock in the neighborhood, while the bull owner rarely is allowed to buy the bull calves for fattening, unless he engages them positively beforehand, and insists on his bargain.

More Butter and Less Cheese.—A correspondent in Allegheny Co., N. Y., writes: "Factories around here are commencing with a less number of cows than last year, as many farmers think that butter is going to pay better than cheese." Of course, it depends on the relative price of cheese and butter. With cheese at 14 cents, and butter at 10 cents, it is doubtless more profitable to keep the milk at home and make butter rather than to send it to the factory. It is equally certain that there can be no export demand for butter at these prices, while there is a steady demand for our cheese. If the supply of butter should exceed our home demand, prices would fall to a price at which it could be exported; and the quality of our butter, as a general rule, is far below that of our cheese, and it would have to be sold at low figures. Sure profit lies in making a first-rate article.

To Prevent Milk Souring.—We know that blisphemy of soda and the similar salt of lime are occasionally used to prevent milk turning sour. The quantities used are very small, but with the ill-judged secrecy which leads some men to keep to themselves facts which might benefit their neighbors, some people keep the quantity a secret. It will be very easy for any one to determine the desirable quantity by beginning to use very little of a dilute solution in one pan, day after day, and seeing what the effect is. Whether the effects are desirable or not, on the whole, we do not know, but no harm will be experienced from using the milk not so strongly impregnated with the salt as to be undrinkable.

Domesticating the Antelope.—A "C. K., Dutchess County. We are not aware that any attempt has been made in this country to breed these animals. Lord Derby introduced the Caracul, or Kiang, the largest of the Antelopes, into England, in 1861. These animals, with a single exception, have been perfectly healthy, have produced young, and the progeny are said to be larger and stronger than the parents. They feed in the pastures with other cattle, and require no extra care. One killed for the table weighed 1,185 pounds. The flesh was delicate and of fine flavor. No doubt they could be introduced here and would thrive. The profitableness of the enterprise can alone be determined by experiment.

A White Mouse, belonging to "D. A. O.," Erie Co., Pa., eats her young ones every time. We suggest as a cure the same treatment we would recommend for a sow—another omnivorous animal occasionally liable to do the same thing; namely, feed almost exclusively roots and fruits several days before littering. Carrots, raw potatoes, and sweet apples, are a good variety.

Cat Phenomenon.—"F. R. M., Mystic Bridge, Conn., has a cat that has adopted two young gray squirrels, and is nursing them with her own kitten. The squirrels were captured before their eyes were open, and the old cat was as blind as her nurslings, as to the deception practiced upon her.

Bees in July, by Wm. W. Cary.—Loes is frequently sustained by neglect to give thin, unpainted hives some protection from the sun. When the temperature rises above 100 degrees in the hive, bees cease labor and cluster outside, thus losing time. It is a not infrequent cause of new swarms deserting. Swarms issuing this month, unless they are strong, should be suitably aided, united, or returned to the parent stocks. Swarms sometimes cluster in places from which the ingenuity of experts is taxed to dislodge them. The following, from J. H. Reiserger, in the American Bee Journal, will be found applicable to a variety of cases. "To keep natural swarms from despoiling when they issue, and induce them to settle in a manner convenient for hiving, I take two or three frames filled with comb, adjust them together at the distance apart at which they are usually set in the hive, and fasten them to a light pole of convenient height. When the swarm issues I present this

to the bees ten or twelve feet in front of their hive, and they usually betake themselves to it without hesitation or delay. If the swarm has already settled on a tree, it can commonly be induced to take possession of the combs, by placing the apparatus gently over or against the cluster. Even if settled in a hedge, otherwise difficult of access, they will readily remove to more acceptable quarters, if the frames be presented to them through an opening in the hedge made by drawing the branches asunder. When the bees have taken full possession of the comb, they are not apt to leave; and the frames may be again separated and set in a hive in the usual manner, with the bees adhering to the combs."

"Artificial Impregnation."—The Kohler process for securing the impregnation of queens with any given stock of drones is a recent discovery, which is exciting great interest in Europe. It is now known to a few of our leading Apianists, who are testing it thoroughly in practice, and has its importance for those interested in bee-breeding, which is becoming a distinct branch of business from honey-producing; the same as breeding fowls is conducted as a distinct business from raising poultry or eggs for market.

The Wild Pigeon Kills Insects.—Mr. Reid says: "I shot some this past summer, one of which had 43 caterpillars over an inch long in its crop. It was a young one." This is some compensation for the damage done to the newly sown wheat crop by this bird. We are always glad to get facts in natural history.

Color of Dorking Chickens when First Hatched.—It is an old saying that any color is admissible and correct in a colored Dorking, save black and white. Many chickens hatched apparently white become gray and silver gray, and apparently black ones become the dark birds that are so much admired.

Hong Kong Geese.—"G. N., Newport, R. I. They are a good variety, and as easily kept in inclosures as the common geese. They cross readily with it, and make a fine large bird. The only objection brought against them is their noise, which has not weighed much with poultry men from the time of old Rome downwards.

Curiosities of Fish Hatching.—At the Hatching Works in Charlestown, N. H., they have a blind trout, and one perfectly white—so transparent when young, that one could see the heart throw the blood at each pulsation through the whole body. They have a double-headed salmon, and a good many specimens of trout doubled in one part or another.

Selling Eggs by Weight.—"E. F.," Windsor Locks, Conn. We do not know of any exception to the rule of selling eggs by the dozen or piece. The sale by weight is the only fair thing, and ought to be recommended by farmers' clubs and agricultural societies.

Hens Eating Eggs.—"D. I.," Michigan. "Is there a cure?"—We think there is, in allowing them to run at large, if they are confined, or in giving them plenty of animal food, and broken oyster shells, or bones. This bad habit is generally contracted in close confinement and indicates the need of a change of diet. They will follow their instincts, and eat eggs, if the constituents of eggs are not furnished in some other form. The cheapest kinds of fish or flesh will be greedily devoured.

Coal Tar on Cloth.—"W. T.," asks if cloth can be water-proofed by means of coal tar, and be flexible. When the tar gets thoroughly dry, the cloth can not be very flexible. We have no experience in the matter, except seeing the effect of coal tar on some fishermen's seines, which were utterly ruined by it.

Lightning Rod Swindlers.—The "Grand Electric Insurance Company" are again operating in some parts of the West. They impose upon the public by means of fraudulent contracts. The "agents" visit farmers and others, propose to put up lightning rods on their buildings, and warrant them good for five years for a specified sum, usually from \$5.00 to \$50.00. Thus far, every thing appears to be well enough, but having agreed to employ them, they present for signature what is represented to be an application for insurance, but in reality is nothing more or less than an agreement to pay them 40c. per foot for the rods put up. The unsuspecting farmer allows the men to go to work as I put up the rods, and does not find out that the job is an expensive one until the collector comes around some weeks later and presents his bill for ten times the amount supposed to be agreed upon. If the victim denies, he is shown the contract with his name at the bottom. Some parties have been foolish enough to give their notes for the amount when it was not convenient to pay the money down; others have stood out and positively refused to

pay more than the specified sum agreed upon, and after repeated threats of law-suits, the "Company" have compromised rather than present their claim before the bar of justice. Our advice to every one who feels that he has been swindled by one of these lightning rod chaps, or by any other traveling swindler, is to appeal to the nearest Justice, if he is not a fool. If one is ashamed to have it known that he has been hoaxed, and would rather skulk out of the scrape by paying these swindling bills, he will do so; but a true man will fight it out and win, if there is any justice to be found in his country. If one needs lightning rods, let him get them put up by responsible parties. Don't employ traveling agents. The whole matter is so simple that we have not, perhaps, given it sufficient space in the *Agriculturist*. An iron rod costing 3 cents a foot, with a sharp end in the air and the other in the ground, is all that is needed. We will try to give more on a subject about which there is so much nonsense.

Leached Ashes.—Mr. M. S. H. says: "I can get soap boilers' ashes for \$1 per load. Will it pay to use them?" Probably not, on your strong clay loam—that is to say, you can probably use other and cheaper means of enriching your land. Where leached ashes can be obtained in the immediate neighborhood, at 50 cents or even a dollar a load, it will well pay to use them; but to pay a dollar a load, and then draw them three miles will probably leave but little profit. In West-ern New York, we have known ten two-horse loads of leached ashes applied per acre, to wheat, with excellent effect. Now the leached ashes of that section are shipped hundreds of miles to Long Island. Where you can grow large crops of clover by the use of plaster, leached ashes should be purchased at cheap rates. They can be used to great advantage, if they do not cost too much.

Gas Lime.—Notwithstanding our rather frequent notes about gas lime, inquiries constantly come in regard to its use. Those who use it should bear in mind that it is, when fresh, strongly alkaline, and somewhat caustic, so that it must not be mixed with animal manures; that it contains poisonous and soluble substances which are destructive to vegetation; that these, after sufficient exposure to the air become changed, and either innocent, or positively useful; and that in addition to the effects of lime as such, exercised in a moderate degree, those of gypsum are also produced very markedly. It is therefore to be regarded as a cheap source of gypsum for agricultural purposes, and always used with caution.

Trial of Hay Implements.—The New Jersey State Agricultural Society will hold a National trial of mowers, reapers, rakes, tedders, horse-forks, etc., commencing July 7th. Full particulars will be given by addressing the Secretary, at Newark, N. J.

Cabbages Affecting the Taste of Milk.—Young Farmer. "Cabbages, or turnips, if fed too constantly to cows, will affect the taste of milk, and this is true of all meat, and some other kinds of fodder. But if the cabbages or turnips be fed only once a day, immediately after milking in the morning, and the cow has a plenty of other feed, the milk will have no unusual taste. Milk cows want a good variety of food. Both cabbages and turnips increase the flow of milk, but do not add to its richness so much as do carrots or parsnips.

Am. Devon Herd Book.—Mr. H. M. Sessions, of South Wilbraham, Mass., is about to publish the second volume of the American Devon Herd Book, with about 600 new pedigrees. This is issued under the auspices of the Am. Cattle Breeders' Association, and it is understood that all the pedigrees are, before acceptance, subjected to the searching scrutiny of an impartial committee of breeders. This beautiful and useful breed are holding their own well, and are valued as highly as ever by their breeders. Registry in this volume will add to the value of the cattle in a way which should lead every Devon breeder to send in the pedigrees of all his best stock.

Shaler's Family Scales are very convenient, and sufficiently accurate for ordinary purposes, if care be taken to always have the article to be weighed placed squarely over the upright or supporting shaft. If moved to the front or rear of the dial, a difference in the weight will be noticed. Experience in their use, with observation, will, in a measure, enable one to remedy this, apparently the only defect in the scales.

Doughnuts.—By Jane E. Duffie. Take one pint of strained buttermilk, 1 teaspoon of sugar, one egg, one teaspoonful of soda, and a little salt. Add four enough to make a stiff dough.

Sally Linn.— $\frac{1}{4}$ pints of flour, $\frac{1}{2}$ cup of butter, $\frac{1}{2}$ cup of yeast, 2 eggs, 1 tablespoonful of sugar, and $\frac{1}{2}$ cup of milk. Mix about five hours before needed,

Collecting Birds' Eggs.—Willie G. Machias, Me. The wanton destruction of birds' nests is reprehensible, but collections of eggs for the sake of learning the habits and characters of the birds are very desirable. You should take out the contents of the eggs at the smallest possible hole, and where it is practicable, preserve the nest with the eggs. It is desirable to have a cabinet or set of shelves on which the nests may be set in order, with their scientific and common names. A collection of the nests and eggs of the birds of your region would have a pecuniary value in the city, and if you have duplicates they can be exchanged for those of other regions. It is very profitable for boys to study natural history, and to make a record of their own observations.

The Butterflies of North America. with descriptions and colored drawings by Wm. H. Edwards, Philadelphia; the American Pomological Society. This is one of the most elegant works ever published in the country. It is issued in numbers, each of which contains five plates, giving from two to five butterflies of life size, and most exquisitely colored from nature. The descriptions are very full, and the work bears the marks of great thoroughness in all its parts. The work is intended to include the new species, and the older ones that have heretofore been inaccurately described and figured. The price per part is \$2, to be had of E. T. Cresson, 518 South 13-st., Philadelphia.

The Parasites of the Honey Bee.—It is well known that our larger domestic animals, from horses and cattle down to canary birds, are affected by various internal and external parasites, but that a large number of parasites trouble the honey bee will be a novelty to most persons. Dr. Packard, in the June No. of the American Naturalist, gives an account of some of these parasites, which infest the larva and the perfect insect. The most interesting part of the article is that which ascribes "foul brood" to a parasitic insect. The subject is one of interest to bee-keepers, and Dr. Packard, American Naturalist, Salem, Mass., would be glad to get specimens to aid him in the study of these parasites, either in the honey-bee or our native bees and wasps.

What is the Proportion of the Sexes?—Every fact bearing upon our domestic animals is of great importance to Mr. Darwin. He writes as he finds it very difficult to obtain information as to the proportional numbers of males and females which are born to our various domestic quadrupeds and birds. It is very rare that records of this kind have been kept. Yet there are here and there curious observers who have noted these facts. If any such will send us their observations we will gladly forward them to Mr. Darwin.

Do Martins Injure Trees?—"W. C. C." Natick, Mass., says that his neighbors complain that martins injure pear trees by plucking off the tender leaves. Mr. C. has 70 trees, and thinks the injury done by the birds is more than offset by the good they do in destroying insects. We have martin boxes in great numbers, but never saw the birds trouble the trees. What is the experience of others?

Tansy for Borers.—"P. H. J.," gives for borers "my way and my father's way before me for over 60 years. Be sure that there are no borers in the trees when planted, and with each tree set out a small bunch of Double Tansy." This is an old remedy, and we give it here more briefly than our correspondent has done, for the purpose of calling out facts. These old notions are not to be passed by without investigation, though the truth that may be to them is often quite different from that assigned by their advocates.

Slugs on Cabbages.—"E. O. W.," Bethany, Pa. You will find the slug rendered and described in the *Agriculturist* for July 1895. Lime; trap made by laying a lettuce or cabbage leaf flat upon the ground, to be taken up early in the morning; and allowing ducks to have the run of the patch, are the chief remedies.

Malice among Plants.—"Miss Bluebird" asks "Is there a plant or flower known by the name of Malice?" Among the corruptions of plant names, Malices has sometimes been changed into Malice—just as Elocampne is called "Yallercompne," and Spikenard, "Spignet." Such corruptions as these are common both in this country and in England.

Early and Late Peaches.—Mr. Thomas J. Pullen, son of the late Isaac Pullen, Hightstown, N. J., has sent us some specimens of Hale's Early Peach from his orchard house. Hale's Early now takes the first rank on the fruit lists, and Mr. P. is warranted in say-

ing: "The tree is a strong grower, ripening its fruit two days to two weeks in advance of the Truths, which heretofore has been the earliest market peach at the North. The flavor is excellent. For orchard house culture I consider it superior to any of about thirty varieties which I have tested. I also hand you a colored lithograph of the Salway, a peach but little, if at all, known in this country. The specimen from which this lithograph was taken was grown by my late father, Mr. Isaac Pullen. He was much pleased with the fine qualities of this peach, and predicted a great reputation for it. It is a large yellow freestone variety, highly colored, an extraordinary bearer, and of good flavor. Its chief recommendation, however, is its lateness. It comes in after the Smock (which has been for many years the principal late peach), and this lengthens the peach season about ten days." The lithograph of the Salway is really beautiful, and if the peach is equal to its portrait, it must be fine indeed. We are quite willing to believe what Mr. Pullen says about peaches, and when he shows us the fruit, we may have more to say about the Salway.

A New Dwarf Arbor Vite.—Mr. A. G. Burgess of East New York, has a remarkably dwarf variety of the Arbor Vite, which he calls "Commodore Nutt." It is not only very dwarf, being but 4 or 6 inches high, but is very bushy, branching below ground and rooting at the base of the branches like box. Like all these very dwarf forms of Arbor Vite, this has only the long early leaves. It is perfectly hardy at East New York, and will doubtless be serviceable for edgings. We have tried a piece of edging set with it and hope to report of its success.

Best Soil for Pear Trees.—Morristown, N. J. A heavy clay loam. It is a waste of labor to plant them on sandy or gravelly soil, unless there is a heavier subsoil beneath. This frequently happens, and the sand may be corrected by bringing a part of the clay to the surface. Plant standards.

A Troublesome "Grass."—J. Fraitz, Lancaster Co., Pa., sends a specimen of a "grass" that is getting to be very troublesome in his vicinity. It is not a grass at all, but a Carex or sedge; the specimen is too young to determine with accuracy, but probably one of the forms of *Carex laxiflora*. We never knew this or its relatives to become annoying as weeds, and the only present advice we can give is to treat it like other weeds.

Railroads and Horticulture.—Paul Grable, of Dutch Flat, California, writes us an account of his orchard, where most fruits flourish at the altitude of 3,800 feet above the sea. He is near the Pacific Railroad, though a thousand feet below it. Last year he sold to the passengers on the railroad, cherries, the crop of one tree eight years old, for \$112, which is good for both Paul and the passengers.

A Law to Protect Fruit Growers.—It will be seen by what follows, that the last Legislature of New York passed a stringent law against the poachers and vandals who have hitherto been a source of constant annoyance to all growers of fruit. Such a law is needed, and should be enacted in every State and Territory. Nothing is more vexatious than to carefully tend a choice tree and watch its maturing fruit, and when it is just ready to be tasted and tested, to have it snatched away by some graceless vagabond, and perhaps the tree itself mutilated. The law makes the owner of the fruit trees or his employees special policemen or constables, with full power to arrest, and hold the poachers in custody.

CHAP. 645.—AN ACT to provide for the more effectual protection of fruit growers against trespassers. Passed May 6, 1895; three-fifths being present.

The People of the State of New York, represented in Senate and Assembly do enact as follows:

SECTION 1. Any person who shall at any time enter upon any orchard, fruit garden, vineyard, or any field or enclosure wherein is cultivated any domestic fruit whatever, and which is kept for such purpose, without the consent of the owner or occupant thereof being previously had and obtained, and with intent to take, or destroy, or injure anything there growing, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished as in such cases provided by law.

§ 2. Any person who shall wilfully cut down, destroy, or in any way injure any tree, shrub, or vine, within any enclosure or field wherein is cultivated any domestic fruit whatever, and which is kept for such purpose, or shall injure any building, trellis, frame work, or any appurtenance belonging to or upon any such field or enclosure, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished as in such case provided by law.

§ 3. It shall be lawful for the owner of any orchard, fruit garden, vineyard, or any field or enclosure wherein is cultivated any domestic fruit whatever, or for any per-

son employed in the cultivation of, or rightfully in the possession of any such field or enclosure, to arrest and detain in custody and convey before any magistrate of the county wherein such arrest is made, any person who may be found violating any or either of the provisions of this act.

§ 4. All fines imposed under the provisions of this act when collected shall be paid, one-half to the owner of the field or enclosure wherein the offense was committed, and one-half to the overseer of the poor for the use of the poor of the county in which conviction is had, and on non-payment of any such fine, the defendant shall be committed to the common jail of the county for a period of not less than thirty days and at the rate of two days for each dollar of the amount of the said fine, and costs in addition thereto.

§ 5. This act shall take effect immediately.

Potato Beetle Specimens.—Mr. J. Halmeyer, Hoston Co., Minn., sends us specimens of the 10-lined potato beetle, neatly framed in birch-bark, the whole being much more ornamental than we supposed such a troublesome insect could be.

That Willow Peeler.—Several parties have written to ask where a good willow peeler may be obtained. The parties manufacturing such an implement would do well to answer in our advertising columns. We do not know where they are now located.

Central Park Animals.—The collections of zoological specimens in the New York Central Park include both domestic animals and wild ones, most of the wild specimens being such as represent our native *Fauna*, and we have repeatedly had drawings made of them. This number of the *Agriculturist* happens to contain three representations derived from this very attractive feature of the Park. The Commissioners are constantly increasing their facilities for keeping and exhibiting animals, and we confidently anticipate that, with the gradual and healthy growth with which the collection has so far progressed, before many years we shall rejoice in a zoological garden, which, for utility and instructiveness, at least, will rival the great collections of Europe.

The American Farmer's Magazine.—We have to welcome another new paper, the first number of which comes to us with the above title. It is in the magazine form, with 32 pages, and published monthly at Cincinnati, by Charles S. Burnett. The first number presents a creditable appearance, the mechanical execution being good and the reading matter sound.

The Bone Phosphate of South Carolina.—"H. G.," Maryland. We have not yet seen the article, and are not aware that it has been put upon the market. The deposits are said to be found in the tide-water bottoms of the Ashley, Cooper, and Stono Rivers. They are said to be made up principally of the bones of dead animals, and to contain 81 per cent of bone phosphate. Reckoning their phosphoric acid at 53 cents a pound, the pure article would be worth \$35 a ton.

Preventive of Lice on Cattle.—"W. F. G.," of Saratoga Springs, writes that if one part of sulphur is mixed with three of salt, and the usual amount of salt feed so mixed, fed to cattle, horses, and sheep, it will be something unusual for louse or tick can be found. He bases his communication upon 30 years' experience.

White Willow for Fence.—"A. S.," Perry Center, N. Y. A good fence may be made by planting so thick as to turn cattle, and cutting the young trees about six feet from the ground, after they are three or four years old. They will sprout from the top of the stumps, and if thinned out the sprouts will make nice poles for fencing or other purposes, in a few years. Or the young trees may be set several feet apart, and the gaps be closed by planting after two or three years. The first is the more common method, and the better if the trimmings are considered of any value.

Wire Fences.—C. O. Howard. If made of large wire and iron posts, they are much more expensive than wood, and no better to turn cattle. The cheap wire fences soon get out of repair, and we do not recommend them. A wood fence or hedge is the best thing for you.

A Row Boat for Fresh Water Ponds.—"G. W. H.," Neshaunack Falls. If the object is a boat for exercise and fishing, a flat bottom is the better pattern. The sides should flare a little and taper from the middle to both ends. The bottom, also, should curve about 1 foot in 18, to bring both ends out of water when launched. Any carpenter can make a boat that will answer your purpose. The seams should be "piped" with pitch. It should be laid up under cover for winter.

Harvesting Barley.—Our friend who "Walks and Talks," sometimes has what old Ned Dexter called an "arter-clap." The following, intended for a part of Walks and Talks, came just too late to go in its proper place: "The plan of harvesting barley recommended by a correspondent of the *Agriculturist* last month (June No., page 219), is new to me. I think it would work well on oats cut early for hay. But I should dislike very much to cut wheat or barley in this way. Barley cut so early that the horses and machine would not hurt it, is not ripe enough; and as it is cured so rapidly from being spread out on the ground, there is no chance for the grain to ripen by the absorption of sap from the straw—as is the case when it is cut green and bound up in sheaves, and allowed to stand in the shock. The experiments quoted by Prof. Johnson, in the *Agricultural Annual*, p. 75, 1867, throw great doubt on the propriety of cutting grain in as green a state as has been recommended for some years. But aside from this, it has always been deemed necessary to let barley get ripe before cutting, in order to insure that evenness in the state of maturity so necessary for malting purposes. 'The only method,' says an experienced Scotch barley grower, John Haxton, of Fife, 'in which this point can be attained, is that of allowing the crop to attain perfect ripeness, which is indicated by the dryness of the grain when squeezed, and by the hanging down of the ear. It is, undoubtedly, an evil to allow the crop to ripen so far; but, excepting where circumstances are particularly favorable to an even growth, the practice is, we fear, a "necessary evil." The best way of harvesting barley unquestionably is to cut it with a reaper and bind it up into sheaves, and shock it just as you do wheat. The first cost is greater, but you save a good deal of barley that in any other method is lost among "ordinary stones and clods." The next best method is to throw it off the reaper into good-sized bunches, and cock it up with a "barley fork." But when barley brings a good price, better screw your courage up to the binding point. It will pay. When once in shock it is comparatively safe. Rake the stubble with a steel-toothed rake, but keep the rakes separate, as they are apt to be weather-stained."

Oats and Barley.—H. H. Stewart. When barley and oats are mixed, the grain is unfit for the brewers' use, and is always used for feeding. Mixed grain crops produce a greater amount of food than either would if occupying the ground alone; hence the practice. Oats and barley mixed, makes excellent horse feed.

Manuring of Growing Crops.—Dry slaked lime, ashes, plaster, leached ashes, etc., may be applied with excellent results to corn or potatoes when these crops are hoed,—best at the first hoeing. Superphosphate of lime, guano, fish manure, horn shavings, or any of the concentrated commercial fertilizers, are useful also. These manures should be hoed in at a little distance from the hills or rows, and thoroughly covered.

Leather Scraps for Manure.—C. S. Waldron, Nyack. Probably the cheapest method of reducing them is to mix them with caustic lime, in a heap, and give them the benefit of the heat of slaking. The lime will make them tender, and then the mass can be put in the compost heap, and undergo a second fermentation. They are a valuable manure, and will pay for carting and decomposing. They are considered equal to Anthracite coal for fuel; hence the price is about the same.

Wheat in England and America.

—An Englishman who is cultivating a farm in the western part of the State says: "Three years ago my brother wrote me that the average yield of the wheat crop in his county (Berkshire) was 55 bushels per acre. If we could only equal that here with wheat at \$3 per bushel, farming would pay. I apprehend we have just as good land in parts of this country, but that the great difference is in the climate. What say you?" We say first that it is not probable that any county ever averaged 55 bushels of wheat per acre. It takes splendid crops to average 20 bushels. The highest average yield of any county in this State, to the best of our recollection, was 29½ bushels per acre, and that was before the advent of the midge. There are few counties that average more than 15 bushels per acre. The English average is probably from 23 to 30 bushels. The highest yield in Mr. Dawes' experimental field during 20 years was 53 bushels, and this was obtained by high manuring, clean culture, and a remarkably favorable season. Ira Apthorp, of Monroe Co., Wis., obtained the prize from the State Society for a crop of wheat which yielded 53 bushels and 9 pounds per acre—the land accurately measured and the statement duly attested. And this was on land that had received no special attention. The previous crop was wheat seeded with clover. The clover was plowed under in June, and the land afterwards harrowed and cultivated. Our own opinion is, that as large crops of wheat can be raised here as in England. Our summer climate is more favorable, and on well-drained

land the wheat, covered as it usually is with snow, is not more liable to winter-kill. The only advantage of the English climate is, that the mild winters afford a longer period of growth. But even here the wheat on dry, rich land will grow under the snow, and we sow a month earlier than in England. We are not sure that wheat grows on as many days here as there. The usual trouble is that our wheat has not food enough. On rich, dry land, wheat will grow later in the fall and earlier in the spring than on poor land—and we think there can be little doubt that it grows more during the winter. Last summer a young American farmer "footed it" through this same county of Berkshire, and was surprised to see feeding troughs in the pastures, and still more to learn that although the young steers were "up to their knees in clover" they received a daily allowance of Indian corn and oil-cake brought from America. And yet beef, of the same quality, is higher here than there. Of course such high feeding makes rich manure. The land, too, is worked until it is as clean as a garden. And then in addition to feeding out all the straw, hay, and turnips, raised on the farm, and the purchase of extra grain and oil-cake, guano, superphosphate, and other artificial fertilizers, are used to a large extent. Is it any wonder that the crops are so large as to convey the impression that the wheat averaged 55 bushels per acre? The same treatment would give us just as large crops here, and from our superior climate with less labor. Whether it will pay or not is an open question.

Peat Pressed for Fuel.

—B. T., Plymouth, Mass. The peat speculation has had its day, and the gentlemen who bought peat bogs at \$100 per acre are anxious to sell. The rights in peat machineries and companies are for sale, very cheap. Respectable looking factories with smoke stacks, on the borders of old heaver dams, can be bought cheap, and perhaps prove a good speculation, if they are altered into barns. The bogs are valuable for draining and turning into meadows, or as storehouses of manure. Losses have occurred in Hartford and Tolland Counties, Ct., to the extent of \$150,000, and a good many smart men, as well as peat bogs, in New England, have been sold. Coal is only one-half the price it was two years ago, and that alters the problem of profit in the peat speculation.

Pine Saw-dust.

—W. L. Webber, Mich. The impression that pine saw-dust is injurious to vegetation has probably no foundation in fact. It contains less potash than the harder kinds of wood, and for that reason is not so valuable. It is quite as good an absorbent of liquid manure in the stable, and if put into the compost heap and allowed to ferment with the other manures of the yard and stable, we do not think the roots of plants would ever find out whether the absorbent was sawed pine or hickory. We would not recommend the use of any kind of saw-dust saturated with urine, before it had been fermented. The resin probably will make the decomposition of pine saw-dust slower, and we should expect to see its influence upon the crops extending over several years. An experiment with a few loads of this bedding would determine its merits. Our correspondent will do a good service to the lumber regions if he will make experiments this season.

Suffolk Hogs.

—J. A. C., Palmyra, N. Y. What is the best pig for a mechanic to keep? The Suffolks are warmly recommended by their advocates for villagers, or those who wish to fatten just enough pork for family use. This, perhaps, accounts for the popularity of the Suffolks in New England, where a large part of the people who keep swine fatten them simply for their own use. The good points of the Suffolk are: small bone, compactness, rapid growth, and easy fattening. They readily consume the waste from the garden and from the kitchen, and with a few bushels of meal in the fall, make the best of lard and pork. We have kept the Suffolk grades and like them as family pigs.

Blackwheat for Manure and Grain.

—A crop so easily raised as blackwheat, and so valuable, both for manure and for grain, ought to be more generally cultivated. The statistics show that it will grow in all parts of the country, yet about two-thirds of the whole yield is grown in Pennsylvania and New York. In 1860 the yield in the whole country was estimated at 17½ million bushels. It grows so rapidly, and produces so large a burden of stalks and foliage, that it is often turned in green, as a manure for other crops. Two crops can be turned in the same season, for this purpose; or it can follow a crop taken off in July, and be grown in time to turn in for hay. It is found to be an excellent preparation for this grain, and we once saw a field where these two crops were grown every year, for several consecutive years, each year showing an increased yield of dry. Blackwheat will grow on quite poor land, and yield 15 or 20 bushels to the acre, and it is this facility of yield-

ing good crops that has led to its use by poor cultivators, and damaged its reputation among the better class of farmers. If the object be to get a green crop to turn in, it is better to use 100 or 200 pounds of Peruvian guano, or its equivalent in some other manure rich in nitrogen, to the acre. This will give a heavy crop, which should be plowed under before the grain forms. If the crop is grown for grain, no manure will be needed upon good land, and light sandy or gravelly loams should have a dressing of ashes, superphosphate of lime, or bone-dust. From two to four pecks of seed are usually sown to the acre, the large quantity upon the poorer land. The best time for sowing is about two months before the early frosts, or in this latitude from the 5th to the 20th of July. The cool nights of autumn are found to be most favorable to the maturing of the seed. It should be cut soon after a portion of the seed turns brown. The rest, which is in milk, will fill out after the cutting, as the straw stands in bunches to cure. Commonly the straw is not bound at all, but is set up in small conical bunches, pressed slightly together at the top, until sufficiently dry for thrashing. As the grain shells very readily, it is always best to select a damp, cloudy day to cart it to the barn, or to the thrashing machine. The grain is valuable, making the fine flour from which buckwheat cakes are prepared, and is also much used in connection with oats and corn, as provender for hogs and horses. The *Agricultural Report* for 1865 gives an analysis which shows this grain to contain water 14.00; flesh formers 1.61; formers 52.1; accessories 23.3; mineral matters 9.1. Fowls are exceedingly fond of it, and it should always enter into the supplies of laying hens. Blackwheat is also one of the best cleansing crops in use. It grows so rapidly and so thick that it smothered all weeds, and leaves the surface soil light and mellow. Corn rarely does well after buckwheat, when sown for grain. It is a good preparation for the root crops. The straw is of some value when fed to sheep, though most farmers allow it to rot in the field, or use it to litter the yards.

Marking Poultry.

—H. E. B. There are several ways of marking poultry. Ducks and geese are easily marked by cutting holes in the webs of their feet with a shoemaker's punch—thus: * * * * *. * * * * show six different and distinct marks. It does not hurt them much, and does them no permanent injury. It is a more difficult thing to mark chickens and turkeys, especially young ones. They have all four toes on each foot, and in most breeds the nails on the three front toes are perfectly distinct when the birds come from the egg. These may be clipped short on one or more toes, of either foot, and so quite a number of marks made. This marking has to be renewed, but as we have no experience in its use, we cannot tell how long it will remain distinct. Adult fowls may be marked by rings of wire on either leg, and with notches filed upon them, but this method of marking is not applicable to growing chicks.

Whitewash.

—W. D., Laurel Lake. The whiteness of the wash depends upon the quality of the lime used. Much of the lime burned for making mortar contains impurities, and is too dark colored. The lime should be fresh burned. Take the large lumps only, and slake a pound or two at a time with boiling water until it is about the thickness of cream. Then add cold rain water until it will flow well from the brush. One or two tablespoonfuls of clean salt, and a quarter of a pound of clean sugar will make it more adhesive. Some add $\frac{1}{2}$ lb. by measure, of milk to the water, for outside work. The wash can be colored for fences and outside work by adding any convenient coloring matter. A small quantity of Venetian-red will make a light peach-blow color. A few ounces of yellow ochre will make a light straw color. The wash will make the wood more durable.

The Black Cayuga Duck.

—G. A. P., Greenwich. We have had no experience with these birds, but know that they are prized by poultry men. It is supposed that they are a cross of the wild black duck with the common Mallard. Their color is black, with a few white feathers on the breast, and a faint green tinge on the head, neck, and wings. They are hardy, and of good size, weighing from 15 to 17 lbs. per pair. They have short legs, are poor walkers, and need guarding at night.

Keeping Sausage Meat.

—J. A. S. writes: "After preparing the sausage meat in the usual way, put it into jars; when the weather becomes warm, and there is danger of spoiling, put it into muslin bags, and then put these bags into strong brine, such as is used for pickling beef. When wanted for use, put one of these sacks into a vessel of water, and let it remain over night; in the morning hang it up and let it drain perfectly dry, and it is ready for use. The sack can be split open, and you have a roll of nice, fresh sausage, which you can cut in slices, make into cakes, roll in flour, and fry."

Cucumbers as a Farm Crop.

Cucumbers are extensively raised in the vicinity of our large cities, especially New York, for making pickles. It is a very good crop for farmers, as it can be raised after the other crops are all planted. The usual time of putting in the seed is from the 25th of June to the 5th of July. An old corn stubble, in good heart, is suitable ground for the pickle patch, though swarth is sometimes selected. Plow and harrow thoroughly, and mark out rows running both ways $4\frac{1}{2}$ feet apart. Put in the hill a large shovelful of well-rotted compost, and cover it with an inch or two of soil. Plant from five to ten seeds in a hill, and thin out to four after the plants are six inches high. If the weather is dry, the manure should be thoroughly drenched in the earl before it is dropped in the hill. It is usual to cultivate the crop but once, just before the vines fall over. Much labor is saved by doing this just at the right time. With a steel tooth cultivator, the ground can be stirred three inches deep, and very little space be left for the hoe. Some sow turnip seed at the time of cultivating, say about the 1st of August, and get half a crop of turnips, which have the ground after the cucumbers have done bearing. Cucumbers can be picked in six weeks from planting, and the season will last from four to six weeks, or until the first frost, and then there is about six weeks for the turnips before the ground freezes. This is working the soil pretty hard, but with high manuring, it pays much better than to have the land idle. The turnips do not exhaust the land more than the weeds that would be certain to grow on land cultivated but once. Cucumbers are not an exhausting crop. With good culture, and a good season, 300,000 pickles are raised upon an acre, and the farmer expects to clear about 300 dollars. Some make a good deal more, but green hands can hardly expect as much. The crop is usually bargained for at the factories, at the beginning of the season, and it is carried to the depot or landing every day. One-half the vines are picked on alternate days, thus keeping the force constantly employed. It takes about four men or boys for an acre during the picking season. The cucumbers are usually assorted into three sizes, the largest for table use, and the two smaller ones for the factory.

Irrigation of Grass Lands.

BY F. W. FUERSTENHAUPT.

[We recall well the surprise and wonder with which we first took in the great power of water as an agricultural implement, so to speak. In the hands of those who know how to use it, the crops of grass are doubled, tripled, quadrupled—with no proportionate outlay of labor or manure. The art of irrigation is indeed simple to those who know how, but it is just sufficiently critical to lead those whose knowledge is not of a practical kind, if they are wise, to have little to say about it. We have the pleasure of introducing to our readers the author of the following as theoretically and practically a master of this subject.—Ed.]

"Agriculture cannot prosper without cattle, and they require wholesome, agreeable, and nourishing fodder—hence its supply must receive particular attention. We may place the grasses first among fodder plants, for they have become indispensable to our domestic animals, and contain the greatest amount of nutritious matter. By proper cultivation, the farmer, in soils not adapted for grain, can achieve almost incredible results with grass. The variety is very great, and

each locality, from the swamp to the dry hillock, from clayey soil to quicksand, brings forth a different species of this wide-spread family. All grasses, however, are not of the same value to the farmer, since they vary considerably in their nature. Some are hard, dry, rough, brittle, not very nourishing, and only partaken of by animals in extreme hunger; others, again, have opposite qualities, and give, both when green and dry, an excellent fodder for horses, cattle, and sheep. The best meadow grass is such as agrees most with the character of the land on which it grows, and with the least volume contains the largest quantity of nutritious matter. The more air, light, warmth, and moderate moisture, can act on vegetation, the more profuse will be the harvest and the finer and better its quality. If meadow land should receive a supply of moisture, by atmospheric vapors, rain, dew, etc., at suitable times and in sufficient quantities, then it would, unaided, be capable of promoting vegetable growth; but it seldom gets this fertilizing element at the time when needed, or in the requisite quantity. Therefore it must be to the interest of agriculture to supply the lack of water by means of artificial arrangements. And nothing can increase the returns more, or better insure the necessary fodder, than a thorough system of irrigation constructed on sound principles. By this the great agricultural problem of attaining the greatest amount of provender with the least cost and on the smallest amount of surface, is fully solved, while the keeping of live-stock and the making of manure is brought into better relations to the culture of grain. A properly irrigated field pays an annual interest to the farmer, and is a constant source of cheap material for fodder and manure for the future. By conducting the water in a fitting manner, we distribute the elements most necessary to vegetable life. The proprietor of land so supplied is never perplexed with anxiety by arid seasons, spring frosts, etc., for these he can avert by the aid of fresh water. He reaps his crops without having to manure, till, or sow. Moles, ants, and other noxious animals and insects, are also destroyed, and thus the whole harvest is insured.

Recognizing thus the importance of irrigation, we need to know, 1st, which kind of water is most useful; 2nd, where and how a system of irrigation is best constructed and applied; and 3rd, what necessary costs are thereby incurred. Each of these points we will briefly explain.

First, every sort of water can be employed for purposes of irrigation. From its great tendency, however, to dissolve many substances, the decomposition of which it promotes, and with which it partly combines, it can never be found perfectly pure in nature, but always commingled with such soluble substances as it has come in contact with. Its action on vegetation is as different as the foreign ingredients it contains, of which very many are detrimental to plants. Natural waters which can be used to boil peas (that is, not very hard); such as contain fish; such as when rapidly evaporated give a blackish precipitate; those which come from chalk, limestone and saline formations; and all brook and river waters, are to be recommended for irrigation. On the other hand, water which has a red color, and looks as if covered with oil, or which gives a brown precipitate, is not fit for this use, because it contains too much iron and tannin. That coming from peat bogs and moor ground, from mines, and deposits of ochre, is also not suitable. If no good water can be had, then the impure may be prepared and improved artificially. Now, all water impregnated with impurities is

meliorated by long exposure to the rays of the sun and the effects of the atmosphere, and by being allowed to stand and deposit these injurious substances. This is easily accomplished if the water be first collected in ponds, from which it can be drawn off as required. Again, by placing animal manure in a large tank and letting the water flow over it, we greatly increase its fertilizing power.

Second, in accordance with the variations of soil, position, climate, and the disposable quantities of water, a similar variety exists among the systems of irrigation, which have gradually sprung up, though the object of all is the same. These systems are divided into two classes, viz.: the irrigation of slopes over which water may trickle, and irrigation by flooding, or overflowing with standing water.

The former may again be subdivided, according to the peculiar nature of the land, into 1st, Irrigation of Natural Slopes; 2nd, of Regulated Slopes; 3rd, Dorsal Irrigation, or where the water flows both ways from a ditch on an artificial ridge. Irrigation by *Standing Water* is subdivided into *natural* and *artificial*.

Which of these various systems is to be adopted, depends altogether on the locality and character of the meadow land; and it is best to consult an experienced person on this point.

Third, nothing should be done before a proper and minute plan has been made, and the kind of workmanship and manner of obtaining material has been determined upon. If these be not attended to beforehand, disorder and errors will be the sure consequence.

A good and regularly constructed system of irrigation may cost, according to circumstances, from \$10 to \$75 per acre, but it secures a double and triple crop, for '*water makes grass.*'"

A Wagon Jack.

There are a score of ways to lift wagon wheels one at a time, to wash them. Most wagon jacks have some pins about them liable to be lost, or to slip out. So one without any, and very simple in its character, and easily made, is so far meritorious, if not novel. "J. B. L." of Barlow, Ohio, sends a neatly whittled model, which we show in the engraving. It consists of three pieces. The long lever is 8 feet long; the upright lever, 2 feet and 10 inches long. Both of these have a slot mortise in one end into which the short lever or handle, which is three feet long, fits. This handle may be made of an inch board, broad and oval-shaped at one end, which needs an iron band around it and extending a short way up the handle, to prevent splitting. Two-inch holes, $4\frac{1}{2}$ inches from center to center, must be bored through this oval part in such a way that the lower one will fall about twice its width back of the other, when the handle is held perpendicular. Corresponding holes are made through the sides of the slot mortices, and hard-wood pegs inserted to fit rather loose. The working is very simple.

The American Badger.

The badgers are a peculiar and interesting genus belonging to the weasel family, but very unlike most of their congeners. The American badger is found west of the Mississippi; its Latin or scientific name is *Taxidea Americana*.

Its length is about two feet, but its long hair makes it look more, and nearly conceals its tail, which is actually about six inches long. The badger is very broad, and the long gray hair upon its back hangs off from it like a cloak or blanket, while the hair of the legs and belly is short and of a dark brown color. This gives the animal a very peculiar appearance, which is well represented in our engraving. The head is small, pointedly conical or wedge-shaped, and striped with light and dark bands, in a way to increase this wedge-shaped appearance. Badgers burrow with great ease, and make their homes beneath the surface of the earth. Their food is both vegetable and animal—they being fond of sweet fruits, nuts, honey, insects, and small animals—and their habits are much like those of the European badger, which they greatly resemble. The skin

is your chemical decision and theory in this matter? I am satisfied the practice is profitable with me." If the hen manure is dry and has always been kept dry, so that it has not undergone fermentation, there will be little or no loss from mixing ashes with it. If the hen manure is decomposed, so that it contains ammoniacal salts,

like horses. The nearest approach to a native hog in this country is the Texan peccary, the animal represented in the accompanying engraving. Two species of peccary and the South American tapir are the only native representatives of the great family of the pachyderms.

The Texas Peccary, Collared Peccary, or Mexican Hog, as it is sometimes called, (*Diocyles torquatus*), is quite an attractive little animal, of thoroughly piggish aspect and manners. It is rather symmetrical in form, slender-legged, the hind feet three-toed, thick-necked, with a snout adapted to rooting. It is about three feet long, and weighs fifty to sixty pounds. The color is dark brownish gray, the bristle-like hairs being nearly black, with white tips. An oblique band of light color passes from the throat upward and backward across

THE AMERICAN BADGER, (*Taxidea Americana*.)

the ashes, especially if the mixture is moist, would set free the ammonia, and cause a loss.

Pachydermous Animals.—The Peccary.

Naturalists classify under the order *Pachydermata*, or thick-lidded animals, the elephant, rhinoceros, hippopotamus, all of the swine

the shoulders. Peccaries feed upon fruits, nuts, roots, insects, and small animals, and occasionally a herd will do considerable damage in destroying crops. They are said to be without fear, and so vigorously do they resist an attack, that they may really be reckoned dangerous foes. Their tusks are concealed, but are nearly straight, sharply two-edged, and very strong, so that they will both cut like a lancet and tear powerfully. In disposition they are irritable. The flesh is sometimes eaten, but it is only fit for food at certain seasons, and then that of the males is never used. The peccary has two glands in the small of the back, or loins, which secrete an oil with a disagreeable odor, which taints the flesh, and these must be immediately removed if one is killed for food. We know not what attempts may have been made to domesticate this animal, but have little

THE TEXAS PECCARY, (*Diocyles torquatus*.)

family, and the horse and his kindred—the ass, zebra, etc. Some of these have not particularly thick skins, but the teeth or other characteristics show their affiliations with those which have. For instance, though to external appearance, the hog and horse are totally unlike, yet the teeth and their arrangement in their jaws are in many respects quite similar. Hogs, besides, have been known which had solid hoofs

doubt it might be done, and in all probability after a few generations the bad flavor of the flesh would be improved and an aptitude to take on fat developed; so that, if from any cause the flesh of the swine should lose in popular favor, we may possibly look for a substitute in that of this Texan cousin, and however distant that day may be, we ought always consider the uses to which our native animals may come.

ASHES, PLASTER, AND HEN MANURE FOR CORN.—"J. W.," of Clyde, N. Y., says he "uses this mixture on his corn, and finds it a very good scare-crow. Some one has written against this mixture as one part neutralizing another. What

Kerry Cattle—"The Poor Man's Cow."

(Concluded from page 241.)

best types of the breed. The importation consisted of the bull "Paddy," the cow "Margaret," (both shown in the engraving), another cow "Honora," and a bull calf dropped on the passage. The animals were photographed by Fontayne, and the pictures copied upon wood. We believe that they present the characteristics of the breed as well as any can. The only other importations of Kerrys that we are aware of are those made by Mr. Sanford Howard in the years 1859 and 1860 for Mr. A. W. Austin, of West Roxbury. The descendants of these, now in possession of Mr. D. F. Appleton, Ipswich, Mass., some 12 or 15 head, have increased notably in size, and improved in form, but retain all their good milking qualities, ability to sustain themselves on coarse and scanty fare, and to hold out very long in giving milk. There are a few other cows in this country, owned by different parties, but all, so far as we can learn, traceable to one of the three importations named; and wherever tested, we believe the Kerry cow fully sustains her character as an extraordinary milker, considering her size and the quantity of food she requires, and demonstrates her right to the title, "the poor man's cow." A standard treatise on cattle says of the Kerrys:

"They are found on the mountains and rude parts of the country, in almost every district. They are small, light, active, and wild. The head is small, although there are exceptions to this in various parts, and so numerous, indeed, are those exceptions, that some describe the native Irish cattle as having thick heads and necks; the horns are short compared with the other breed, all of them fine, some of them rather upright, and frequently, after projecting forward, then turning backward. Although somewhat deficient in the hind quarters, they are high-boned, and wide over the hips, yet the bone generally is not heavy. The hair is coarse and long; in some places they are black, in others brindled; and in others black or brindled, with white faces. Some are fine in the bone, and finer in the neck, with a good eye, and sharp muzzle, and great activity. They are exceedingly hardy; they live through the winter, and sometimes fatten on their native mountains and moors; and when removed to a better climate and soil, they fatten with all the rapidity of the aboriginal cattle of the Highlands and Wales. They are generally very good milkers, and many of them are excellent in this respect."

Yonatt says: "The Kerry is truly a poor man's cow, living everywhere, hardy, yielding, for her size, abundance of milk of a good quality, and fattening rapidly when required." Milburn observes: "She is a treasure to the cottage farmer; so hardy that she will live where other cattle starve. She is a perfect machine for converting the coarsest cattle food into rich and nutritious milk and butter." Prof. Low remarks: "The peculiar value of the Kerry breed is the adaptation of the females to the purposes of the dairy. In milking properties, the Kerry cow, taking size into account, is equal or superior to any in the British Islands. It is the large quantity of milk yielded by an animal so small which renders the Kerry cow so generally valued by the cottagers and smaller tenants of Ireland. She is frequently termed 'the poor man's cow,' and she merits this appellation by her capacity of subsisting on such fare as he can supply."

We can hardly give these statements from distinguished British writers upon cattle without expressing our own belief that the quantity

and quality of the food have just as much to do with the milk a Kerry will yield as with a cow of any good milch breed—however true it may be that she will make more and better milk than another cow on a very inferior quality of fodder, and on hard, rough, short pasturage.

Walks and Talks on the Farm—No. 55.

When James Caird visited this country he met at Niagara Falls a brother Scotchman who had resided here for thirty years. Said he: "Oh, man, they're meeserable farmers. It would break your heart to see how they just scart the groon. It's no very guid, ony way, but they dinna gie't a chance." I am half inclined to think the old Scotchman right. We do not give the ground a chance. I am sure I do not. My wheat is full of red-root, and there are thistles enough in the barley and in the clover to "break the heart" of any one accustomed to the clean culture of the Lothians. I do not want better land or a better climate than we have here. All that is needed is to give the ground a chance. I was once on William Bennett's celebrated farm in Bedfordshire, and remarked that the land looked as though it was not naturally rich. "Yes," said he, "it's poor land, but it's very grateful." And so it is with our land. Drain and cultivate it thoroughly, and give it a little good manure, and it will overwhelm you with gratitude. I question if there is any land in the world that gives such large and immediate returns for the labor expended upon it. This is due, probably, to our cold winters and hot summers. Only give the ground a chance.

"If I was a young man," writes an old friend, "I would go south and buy a farm." If I was young, I would stay just where I am. There is certainly work enough to be done here, and that is the place for a man who is able and willing to do it. Judged by a high standard, we may be "meeserable farmers," but the next twenty years will enable us to make a better show. The nurserymen and market gardeners, with here and there an enterprising farmer, are showing us what land will do if it has a chance. There is a slow but unmistakable improvement going on every year. Corn is cultivated oftener and more thoroughly—and that is one of the best criterions of good farming. The Deacon concluded to sell his farm, and was offered \$140 per acre, but wanted \$150. He says now he will stay where he is, and will "see if he cannot find another farm under the present one." He has bought a new Michigan double plow, and came the other morning to borrow a three-horse erener. Mine were all in the field, and I told him he would find a rip-saw in the tool-house, and some two-inch elm plank under the shed, and that he could make one in less time than he could go to the field and back. Many people think they must have hickory, but elm answers the purpose well enough. The Deacon made a capital one, sawing it wider where the strain comes. An elm evener in this shape is a good

THE DEACON'S EVENER.

deal stronger than a hickory one of the same weight saved straight. The Deacon, too, is going to underdrain this fall, and I presume intends to make more from his fifty acres than I do from a hundred. He is delighted with his Michigan double plow, and put it in a couple of inches deeper than the land has ever been plowed before. He does not propose to "scart

the groon." And I believe this is simply an indication of the improvement that is quietly taking place all over the country. We shall not be "meeserable farmers" much longer. High prices have given agricultural improvement an impetus that cannot be stopped even should they not continue.

Deep plowing, however, is not all that is necessary to produce good crops. Some farmers who plow deep "scart the groon" afterwards. This is one reason for the great difference of opinion in regard to deep plowing. One farmer tries it and finds great benefit; another tries it, and reports that it does more harm than good. Now if the former cultivated his land thoroughly and deeply afterwards, and the other merely scratched on the surface without breaking the lumps, it is easy to account for the difference.

My old friend Dr. Adam does not agree with some of the remarks made in our free and easy Talks. He thinks I underrate the value of nitrogen in food, because I contend that the amount of nitrogen in different foods is not the measure of their nutritive value. It is no use wasting words on such a point. Peas contain as much again nitrogen as Indian corn, and if he knows of a way of feeding them so as to produce double the amount of milk or beef, I would like to know it. He thinks, too, that the value of manure depends on the kind of animal it is obtained from, and not merely on the food. I do not recollect exactly what I said, but I was trying to show that it was a pity agricultural writers should waste so much time in discussing the value of manure from the different classes of farm stock, while they say little or nothing in regard to the food from which the manure is derived. I contended that it makes no sort of practical difference, so far as the value of the manure is concerned, which kind of stock a given amount of food is fed to. The Doctor thinks it does, and wastes his time in trying to prove that if the animal takes out a certain quantity of nitrogen, phosphates, and potash, in the form of wool, bone, flesh, or cheese, there will not be as large a quantity of these elements left in the manure as if none had been abstracted. Of course I never denied such a self-evident proposition. A cow that eats thirty pounds of clover hay and ten pounds of middlings a day, would consume during the year:

	Containing Nitrogen.	Phosphates.	Potash.
Hay, 10,550 lbs.,....	273	136½	142
Middlings, 9850 lbs.,....	94	20½	51
Total in food,.....	367	161	193
In 600 lbs cheese.....	27	20	8
In manure,.....	340	181	215

Now will the Doctor figure out how much one would lose from feeding the same amount of food to sheep that shear, say six pounds of wool a year, and how much from a growing steer, and how much from a fattening animal, and how much from a pig, and how much from a horse? It would take me half a day to do it, and I do not propose to allow this class of speculative writers to rob me of time that can be much better spent in cultivating corn. Mr. Lawes has been investigating this subject for twenty years, and will shortly publish the results of his experiments. He writes me in reply to some inquiries: "The value of the manure depends entirely upon the food. The quantity of nitrogen stored up in the animal is very small, and it is probable, from recent experiments at Rothamstead and in Germany, that but little nitrogen is evolved by respiration or by the

functions of the body." If the yard be exposed to get the wash of the eaves, it will make vastly more difference in the composition of the manure than the animals possibly can.

My cows appeared in capital order up to the time of calving, but fell off rapidly in flesh afterwards. I have never had them go out to grass in such poor condition, and never had such poor milk. The reason, I think, is this. Butter brought a high price, and we tried to make as much as possible. I had an abundance of capital corn-fodder, with considerable small ears of corn on it. The cows had all they would eat, and not only gave rich milk, but kept in high condition. Some of them, in fact, were fat enough for beef. It was difficult to dry off some of the best milkers, and we milked them until within a month or six weeks of calving. About the first of April we had fed out all the corn-fodder, and after that they had clover hay, all they would eat, but no grain. It was just the time when they needed good feeding, and I presume they missed the corn. The corn-fodder stimulated the secretion of milk, and when we dried them off the calves required it. In fact, though we stopped milking them, they doubtless secreted as much milk as before, and the clover hay did not afford as much nutriment as the corn-fodder. Hence the cows got thin. It was bad management. I am now slopping them with two quarts of corn meal a day, in hopes of correcting the mistake.

It is evident to any thoughtful man that we have entered a new epoch in American agriculture. Our population increases rapidly, and the production of food does not keep pace with it. "I have just sold a two-year-old heifer for \$60," said an old farmer. "I had no idea of selling her. She had run in the yard all winter, and I never fed her a handful of grain, but a butcher saw her and offered me \$60 for her." He thought it a great price. I told him that a well-bred animal, with liberal feeding could easily be made worth \$100 at two years old. It seems difficult for an old farmer to realize the changed condition of things. He is apt to think that a thing which did not pay when the country was new will not pay now. "Fifteen dollars for a calf!" exclaimed a city friend the other day. "I thought calves were not worth more than a dollar apiece. My father used to sell them for that." Some years ago I read a paper on the "Four Course System of British Agriculture," before the Provincial Agricultural Society of Canada West. Robert Russell was here at the time and attended the meeting. There was a ball given by the Mayor the same evening, and nearly all the prominent members of the society attended it. Russell was disgusted. They did things very differently in Scotland. He thought agriculture was not appreciated. How could it be, with calves a dollar apiece and wheat seventy-five cents a bushel? We have now high prices—perhaps a little too high—but they were necessary to place agriculture on its true foundation. Farming will now be as respectable in fact as it has hitherto been in theory. Let young farmers take a calm view of the situation. We are going to have a very different system of farming from what we have had. Mark you, I am not finding fault with the old farmers. No man can respect them more than I do. They have done an immense amount of work and done it well. Their system was the best in the circumstances. But the "stump period" has passed, and is followed by the mowing machine, with the steam plow appearing in the distance. Virginia fences and bad roads are still found, but they, too, will soon

belong to the past. Underdraining will improve the latter, and the high price of wood will banish the former. Labor is more abundant, and wages are paid in wheat less than formerly. The American-born or American-trained German makes a splendid farm man, and takes more readily to new plans than the English or the Irish. The district school has a prodigious influence. Now let our young farmers bestir themselves. They must be "men of thought and men of action." In the older settled sections we have blacksmiths, and wheelwrights, and carpenters, and brick-layers, and saddlers, at no great distance, and it is no longer necessary for a farmer to be a "Jack of all Trades." His business is to cultivate the land; to look well to the state of his flocks and his herds; to attend to the thousand little details of his establishment. He must have a trained mind and skilful hands—must be able to work himself and direct others. He must plan work for all kinds of weather, and not do in summer what should be done in winter—should not work in the barn when the sun shines and make hay when it rains. He requires great energy, promptness, and perseverance. Much of his success will depend on getting his land in good order and sowing in proper season, and it requires no little forethought and good judgment to accomplish even this. It is a good deal easier to "work" than it is to think. The best general rule for a young farmer's guidance is to do first what he likes to do least.

Yes, I saw the article and know the writer. He has no acquaintance with practical agriculture, and of course thinks it an easy matter to raise large crops and "make farming pay." He does not know what he is talking about. A knowledge of "book-keeping" would be of great use to a farmer, but it does not follow that a man who understands book-keeping would make a good farmer. An acquaintance with chemistry and other sciences would be of great benefit to a practical farmer, but it does not follow that the chemist can "make farming pay."

This subject ought to be understood. Many people seem to think that it is the easiest thing in the world to manage a farm; while in point of fact it requires far more brains to be a first-rate farmer than to be a second-rate lawyer. The man who thinks that *because* he has studied agricultural chemistry he will make a good farmer is a goose. If he has the necessary qualities for success as a farmer, and likes the business, he will probably succeed. If he has not, all the chemistry in the world will not enable him to "make farming pay." Chemistry will not teach him how to buy and how to sell. It will not get him out of bed in a morning. It will teach him how milk is formed, and why it turns sour, but it will not secure regular feeding and steady milking. It will teach him the importance of having *boiling* water to scald the milk-pans, but it will not enable him to have everything ready just when it is wanted. If he would make a good farmer without chemistry, a scientific education will enable him to make a still better and more successful farmer; but if he would not succeed in some degree without it, chemistry will not enable him to make farming pay.

If the tedding machines would work well in a heavy clover crop, and would not knock off the leaves, they would be of great use. Mine works well in meadow hay, but clogs in clover. Mr. Gould says it is because I have one of the old machines, and that now they are made stronger, and work well in clover. If tedded

immediately after the mower, I do not think it would shake off the leaves, and would unquestionably facilitate the curing. John Johnston writes me that if tedded, clover cut in the morning in hot weather can be cocked in the afternoon, say by four o'clock, and by turning the cocks over can be got in the next day. I imagine the real point in hay-making is to cure as rapidly as possible for the first four or five hours after it is cut. It is while the hay is full of sap that injurious fermentation is most likely to occur. If the tedder will work it would pay to go over it every hour as long as there was no danger of breaking off the leaves. We have a splendid climate for making hay, and with a mowing machine and a good tedder we ought to be able to save all, or nearly all, the nutriment there is in the grass. There can be little doubt, however, that we frequently lose nearly half of it.

The Village Cow—Soiling.

There are multitudes of villagers owning from one to three acres of land, that have given up the keeping of a cow, mainly on account of the difficulty of finding pasture for her during the summer. They want in their families, on an average, four quarts of milk daily, and at least a pound of butter, worth at present prices not far from \$4.00 a week, or \$200 a year. A good cow might not supply all of this regularly the year round, but she would supply half of it for six months in the year, and the want of the cow will pretty surely compel a man to pay nearly this sum for these two items of household luxury. The remedy for the loss of the summer pasture is soiling. Make one acre of the land that lies idle, or is but half improved, rich enough, and it will support an average-sized cow through the year. It is estimated by those who have tried the experiment that a half acre, cultivated with a good succession of crops, will supply all the green fodder a cow can eat, with a large surplus of dry fodder for the winter; while the other half acre will furnish roots enough for succulent food through the winter. If there is no manure upon the premises, this indispensable article would have to be purchased for the first year; after that, the heap made from soiling, and the utilization of all the wastes of the family, might be relied upon to keep up the fertility of the land and to increase it year by year. The soiling crops found to be profitable, are winter rye, Italian rye grass, cabbage, oats, millet, sorghum, and Indian corn and clover. There are others, perhaps, equally good, or better for a more southern climate, but with these a man may have a good succession from early spring until frost. The rye is the first to start, then cabbage sprouts, clover, oats, and Indian corn, in due order. The corn will need to be planted in successive strips in drills, every two weeks from the middle of May until the first of August, and the later sowings may have strap-leaved turnips sown between the drills, after the corn is well started. Use these successive green crops as soon as they yield good cuttings, and what is not wanted cure for winter use. The other half acre should be kept in roots and cabbages—say $\frac{1}{4}$ in late cabbages, $\frac{1}{4}$ in sugar beets, and $\frac{1}{4}$ in mangels. The yield of roots ought to be 300 bushels of mangels, and 100 or more of sugar beets. This will give the cow quite as many roots as she can profitably eat for six months of the year. Probably a part of them could be economically exchanged for oil-cake or cotton-seed meal. This, of course, would involve a considerable labor, but many of these

villagers keep one hired man during the summer as man of all work, or a gardener whose time is not fully occupied, or have boys for whom such occupation would be a great blessing, as it would keep them out of mischief, give them an agricultural education, and help them to a reliable means of self support. The best kind of cow for villagers is a matter of fancy somewhat. If butter and cream are leading objects, an Alderney, either pure blood or grade, according to the means of the purchaser, would be best. If quantity of milk is the main thing desired, a Short-horn or Ayrshire grade would be better. A good grade or native cow can ordinarily be picked up, and a very superior one by offering \$10 or \$15 above the market price. But by all means, the cow for family use, whatever her breed, should have a good reputation for both milk and butter. If you mean to be at extra expense for soiling, have an extra animal to feed—one whose market value is a hundred dollars and upwards. For quarters, the cow may be confined all of the time in a well-ventilated and lighted stable. If she can have the sun occasionally, she will not suffer much for the want of exercise. Use the currycomb and brush freely, every day if possible. Keep the stable well furnished with litter, and the cow clean and comfortable. We are persuaded the difficulties of soiling are greatly overestimated by the people who have not tried it, especially the raising of roots. Once get a clear view of what is wanted, adopt your plan, and the difficulties will vanish. Many in our villages and in the suburbs of large towns can get their milk and butter cheaper and better by this method than by any other. One great advantage of soiling is the great quantity of manure it furnishes for the land, and in this its success wholly lies.

Fig. 1.—VIEW OF FENCE ACROSS A STREAM.

Swinging Fences Across Streams.

We have heretofore been indebted to several of the *Agriculturist's* subscribers for plans for carrying fences across fordable streams, subject to great rise and fall. Cattle and hogs will not dive, and they will seldom voluntarily swim; so though cattle will sometimes swim to cross from one side of a stream to the other, they will not willingly venture to cross the line of a fence at high water, even though the fence be washed away. Such streams often bring down great masses of flood-wood and trees washed from the banks, but this usually occurs only at the very highest floods. The problem of fencing across fordable streams resolves itself to this, namely: To prevent hogs and cattle getting out at low water, and to contrive such a structure as shall allow logs and drift-wood to pass without the fence itself suffering harm, or being carried away.

A "Lancaster County (Pa.) Farmer" sends us the following description of his way of doing the thing; and from his description and a few pen marks our artist has made a very pretty pic-

Fig. 2.—DIAGRAM OF SWINGING FENCE.

ture, of which "L. C. F." cannot have the credit. "I have had my plan in use for twelve years over a stream of water from fifty to sixty feet wide, which at times rises from eight to twelve feet high, and it withstood all the floods unharmed with the exception of breaking the hook at one end, which was easily repaired; and it has not cost me a dollar since I put it up. I sunk heavy posts on each bank, from four to five feet in the ground, and fastened well with stones. I put a ring over each post three inches wide, and had a hole punched in the ring on opposite sides for the bolt or hook to pass through. The shank of the hook is at least six inches longer than the post is thick, with a screw cut the whole six inches, and furnished with a nut to stretch the chain to its proper place. When I first put the chain across, I planted willow trees, which are now large enough to use should the posts give out. I bought five-eighths double-refined round iron rods, and had them cut three feet long, and had an eye turned and welded on each end; then had a link made of the same iron, about eight inches long, welded into the eyes of two rods, and so on; then had three or four links at each end of the chain for the purpose of taking it up if it sagged too much. The hooks were made of the best three-quarter-inch iron. Then I straightened out old carriage tire, turned a hook on one end, and punched four holes in each. I fastened these tires to boards with small bolts, as shown. The hooked

ends of the irons went over the chain, and when on I closed the hooks to prevent them from coming off. The boards should be eight or ten inches wide; two boards deep is sufficient, and the lower one ought to be in the water, to prevent hogs getting under when the stream is low.

I would, in all cases, swing the chain as low down to the water as possible, having it high enough to prevent cattle from getting over it. When the water rises, it will soon be over the chain, and all drift-wood will pass over harmless. The higher your chain is, the more danger there will be of rubbish lodging and breaking it. I contend that there is much more strength in a chain of this description than in a rod, for when a log strikes it the whole chain gives, and resists the pressure with much more elasticity.

THE HARROW-TOOTHED CULTIVATOR.—"One who has tried it," writes: "I wish to record

my experience in the use of the cultivator with harrow teeth, described in Henderson's *Gardening for Profit*, and also in the *Agriculturist* for Feb. 1867. You advise its use as a garden implement. Do you know that it cannot be beaten for giving corn its first cultivation? I would advise every farmer to procure one; when corn makes its appearance you can run through almost before you can see the rows, and a great deal closer to the hills than with a cultivator with shovel teeth. It does not throw up lumps and cover the corn; on the contrary, it leaves the soil fine, level, and in good condition. Plant the garden vegetables in rows, far enough apart to get between them with the horse, and as soon as the rows become visible, in with the cultivator, and if this process is repeated every week, it will save a great deal of hand-hoeing, and weeds will disappear. But don't let the weeds get the start, or you will have to resort to the hoe."

Pure Water for Chickens.

The season has been a very wet one, just the weather to give the gapes. Last year, with great care in feeding, we lost a number. So far, this year, with great care to have pure water, we have not seen a chicken gape. We know care enough was not taken to have the water always pure. "Mother Wit" takes the place of a long purse to those who possess it, and our friend Mabbett, who is ready in expedients, suggested to us the use of a fruit-can filled with water, covered with a flower-pot saucer, and then quickly inverted, as a better drinking fountain than the earthen ones, or indeed, than any others, and we so find it. Everybody has old fruit-cans, or everybody ought to have, for there are no cheap luxuries equal to these canned fruits and vegetables. Put a nail under the can.

Scarifier for Root Crops, etc.

We were obliged to tax our inventive faculties a few weeks since to get an implement which would mingle some concentrated manures in the drill before planting potatoes and corn, lest the strength of the fertilizer untempered with soil might hurt the seed. It proves so use-

SCARIFIER.

ful for this and for other purposes that we had an engraving made, and commend it to the readers of the *Agriculturist* for the purpose for which it was made, as well as for working between all crops raised in drills 16 inches to 2 feet apart. It will work well late in the season be-

tween rows where the common cultivators and horse-hoes are better employed before the plants begin to cover much breadth of soil. A piece of oak slab, ten inches wide and about three inches thick, was taken, and six barrow teeth were set in it, all having a rake to the rear. After the first two, the others had an outward slant, so that the rear teeth spread at the points fully one foot, the front ones being about six inches apart. A handle was improvised, bolted to the slab in front and braced behind, and a plain clevis completed the affair, which has, at a moderate estimate, paid for itself twice over already.

Another Kansas Corn House.

Mr. Crawford Moore, of Leavenworth Co., Kansas, thinks we do injustice to his corn house by the intimation that the one built by "Ottawa Jones," figured on page 57, (February), might be the best in the State of Kansas. Our readers may see both plans, and judge between them. It will be seen by reference to the engraving that the house stands upon sloping ground, and thus while the roof and floors are level, the floor of each section of 20 feet drops down a step. The entire building is 60 feet in length by 30 in width, and is constructed as follows: It has an alley or cart-way running lengthwise through the center, which is 10 feet wide at the sills, and 8 feet wide at the top. On each side of the alley is a crib 10 feet wide at the bottom, and 11 feet at the top. The outer and inner sides of the cribs are slatted perpendicularly; the gable ends are close-boarded. Each crib-gable has a door, and sliding doors upon rollers close the cart-way at each end. There is a floored loft over the whole, lighted by doors in the ends, which is used for storing grain and agricultural implements. These are hoisted by a block and tackle through trap doors. The building rests on 52 oak posts, resting on stone bases, set two feet in the ground, and coming six inches above the surface. It is built entirely of native oak and walnut. The posts at one end are 10 feet long; at the other, a little over 12, on account of the slope of the ground. The cribs will each hold 6,080 bushels of corn, allowing three half-bushels for a bushel of ears. Mr. Moore adds: "Tell those Down-easters to sell their little ten-acre patches, and come out here and buy 160 acres, and have plenty of money left to stock it well." In behalf of the "Down-easters," who enjoy proximity to good markets and don't like to get far beyond the smell of salt water, we tell him, if he thinks he can afford to do with less land and smaller corn cribs, he may sell his quarter section and get money enough to buy a ten-acre farm east, but not have money enough left to stock it.

Barn Cellars free from Posts.

Manure cellars under the cattle and in first-class barns have been the subject of no little discussion among progressive and sound-thinking men. There are fairly two sides to the question. By means of cellars a very large quantity of excellent manure may be made with a minimum amount of labor. With tight floors and thorough fine ventilation, the cattle get no harm, the stables are warm, and the air in them pure. Those who object to them do not claim greater profit, but a better quality of manure, (with a greater proportionate amount of labor), a greater degree of freshness and purity of air in the stables, and in the whole barn. In this they are, indeed, right, unless great and constant care is taken to maintain cleanliness and ventilation. In measuring ordinary farm profits merely, the preference is to be given to the plan of storing the manure in the cellar. We present here a communication from our Shaker friend, Elijah Myrick, upon the subject. He says:

"The important subject of barn cellars seems to have passed the experimental stage, and the real practical necessity and profit to a farm being fully established, it only remains to employ the means to make it the most convenient and effective. To most farmers this is the only building to which they look for profit. And it is for their interest that it should be so constructed and managed as most easily to secure it. A cellar under a barn is as cheap as it is necessary, and should be made a source of as much profit, or more, than any room under the roof. For making and keeping manure, storing tools, keeping hogs, sheep, and small cattle, the room is almost indispensable. I have in mind a barn 140 by 45 feet, with 26 feet posts, built in 1831, without any cellar; otherwise it combined many of the modern improvements. In 1855 it was raised eight feet, making a nine-foot cellar under the whole, counting on the advantage of

the cellar for manure alone. Without any extra labor, the hay on the same land has nearly doubled, which is attributed wholly to the increased quantity and quality of manure. The barn being very heavy when filled with hay and cattle, it was thought necessary to put posts under the two rows of center posts, thereby causing very serious and objectionable barriers to a free use of the cellar when carting in and out, though the posts were 12 to 15 feet apart.

That there should be no unnecessary obstruc-

tion in depositing and drawing from the 'Farmer's Bank,' these posts are now being removed with safety, and at an expense by no means out of proportion to the convenience. The accompanying sketch of a section of a frame shows a very simple method of supporting a frame. The rods are made in pieces, coupled together under each beam, the couplings being about 4 inches long and 3 inches in diameter with a flange on the top end, which serves as a collar to support the beam above it. Being thus connected and with a nut and collar at the top and bottom ends, the rods make a cheap and sure support. The collars should be made a little crowning on the face side, and then they will not break. By this method the cross beams may all be whole and much stronger than when framed into middle posts. Then they will sustain all lateral pressure, and be strong enough to fully compensate for lack of braces. The roof will be very strongly braced. The long braces under the eaves are not objectionable;—one long brace is worth two short ones, in our opinion.

I have seen several large barns trussed up in various ways. Some have worked well; others have failed to meet the expectation, for want of proper construction. In all, so far as I know, both frame and rods have been used; that is, they have been framed without any reference to using rods, and afterwards they were applied, making great and needless expense of labor and material, and the necessity of splicing either the beams or posts where they cross each other.

The illustrations show simple, neat, and durable structures, and a pleasing style of architecture, as well as widely applicable. Fig. 2 represents a section, or rather the different modes of supporting the different sections, in the barn

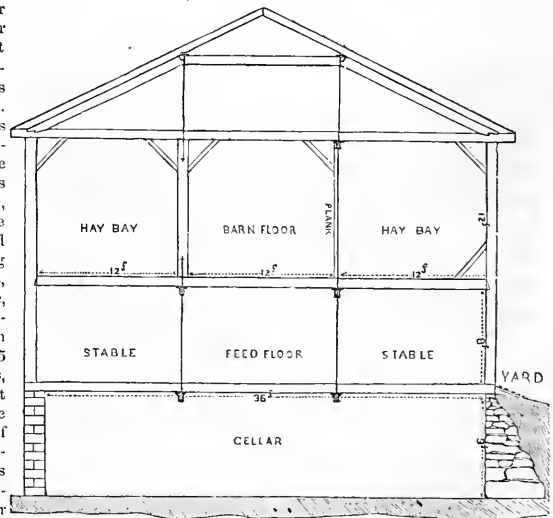

Fig. 1.—SECTION OF BARN.

referred to above, now having the posts removed. The right hand post has the lower part removed in front of the cattle; on the left hand side the sill is secured to the post by a joint bolt running up into the post. Fig. 1 represents two ways of supporting the frame of common barns when built new. They both show double stable barns; that is, on the first floor there are two stables running the whole length on either side, and a feed floor in the middle. On the next loft is a hay bay on each side, with drive floor in

the center. This is, however, not the most common way of building, but it has many advantages, viz.: nearly double the stable room in the same length, and a feed floor always intact, neat, and clean; on the next loft a drive-way that never interferes with the feed floor, and may be used for storage most of the year, if desired; then the convenience of throwing the hay down on a level with the floor on either side, with but very little pitching up; and finally, a barn of 40 feet in length will stable more cattle, and store more hay, than one in the last case, 60 feet long—while the only items of extra

Oaks to live, coalin' was a good bizness, and a feller had a chance to make suthin' extra on swappin' horses and pitchin' quates. But neow every body is so poor they can't pay the boot in a trade, or the stakes, when they git beat in quates. Tell ye what 'tis, Uncle Jotham, there aint coppers enuff in the White Oaks on ordinary okashuns to buy a decent glass of likker. I'm gwine to sell eout airly, and come on to the street to live, and so keep from comin' onto the town."

"Mighty slim chance for ye here," said Seth Twiggs, bauling out a tinfoil package from his pocket, and thrusting in his pipe and forefinger

at the top. "Ye see, the widdler's eighty acres wouldn't buy five here, throwin' in the widdler, young ones, and all. Property's ris here worse than emptins, the last ten years."

"Wal, I guess the old man wont hold on forever," said Kier, looking up the hill, where Jake Frink still leads a slipshod life.

"It's poor bizness waitin' for dead men's shoes," said Uncle Jotham. "Better ruu that coal cart offener, and swop hosses less. Pitchin' quates and takin' the stakes in likker don't pay in the long run. Land aint worth much in the White Oaks or anywhere else, unless you work it. They work the land down here and pretty much everything else. Any thing, or anybody, gets liek'd that lies idle."

"Yes, yes," said Kier, "I remember them lickin's. That's what started me off to the widdler's, where things went easy."

"And folks round heretake the *Agriculturist*," chimed in Seth Twiggs, whose pipe by this time was in full blast. "More'n forty copies come to the Hookertown post-office, and 'taint more'n twelve year ago there wa'n't but three, and I was the fourth man that took it, and I shouldn't 'ave done it if it hadn't been for the woman. Ye see, she offer'd to pay for it if I couldn't. She lauff'd consuedly when I set up readin' on't the fust night it cum till smack twelve o'clock."

"A pretty state of things we'll have here in Hookertown shortly!" exclaimed George Washington Tucker, who had now joined the party. "What with your Agriculturists, and old Bunker's experiments, and everybody aping him, and snappin' up every bit of land that comes into market, there wont be any chance for a poor feller to live in town. Rents have more than doubled in five years."

"Doubled!" exclaimed Benjamin Franklin Jones. "I've got to pay a hundred dollars for my place this year, and ten years ago I got it for twenty-five. Some say it's the war, and some say it's short crops. But that's all nonsense. Tim Bunker and the paper is at the bottom of the whole of it. Ye see, when that salt mash was reclaimed, and the bottom knocked out of that horse-pond, at the foot of Jake Frink's hill, everybody took to drainin' as if their everlasting fortune was gwine to be made

right off. There aint a swamp anywhere within five mile of Hookertown neow, but what is as dry as a bone, and kivered with the tallest kind or herd's grass or corn. Sical a hankerin' arter land I never expected to see. Folks aint no plentier than they used to be, but land is a deal skaser, and growin' more so. There's no kind of a decent chance for poor folks to live."

This talk of my neighbors shows the drift of public opinion on the real estate question. In some communities farming lands have risen and quadrupled in value within the last twenty years. In others, they are worth no more than they were a hundred years ago, and hardly so much. Jones has got hold of the philosophy of it, though he is not much of a philosopher, where his own affairs are concerned. In the White Oaks, and places of that kind, land is cheap because cheap people own it, who think a good deal more of shooting-matches, horse-races, and poor whiskey, than they do of farming. As Kier Frink says, "there aint a man of 'em but would sell his soul for a chaw of tabaker." Kier is a little disgusted just now, and perhaps the statement is a little harsh. But it stands to reason that the land isn't worth much unless you work it, and get something out of it. If it bears nothing but wood, cut off for coal once in thirty years, everybody presumes that is all it is good for. Nobody that has capital wants horse jockeys, gamblers, and loafers, for neighbors, and so land is cheap in the White Oaks. Land is worth any sum you can make it pay the interest on, and take care of itself, and it isn't worth a cent more. Some is dear at ten dollars an acre, and other is cheap at \$400 for farming purposes. And it does not depend altogether on its original character. Poor land can be made productive by right treatment, and pay its way as well as that which is good. That horse-pond lot was poor property for Jake Frink at twenty dollars an acre. He did not get his interest from it at that price. It certainly is worth three hundred to me, aside from the abatement of a nuisance, which it always was, until it was drained. A variety of causes have made land dearer about Hookertown. There are more people and of course more purchasers of homes. The place has felt the effect of the war, and of a depreciated currency, which makes almost every thing dearer. But this cause has affected the price of land less than most other property. Improved husbandry has more to do with it than anything else, and in this matter agricultural societies, papers, and books, have had their influence. A good farmer put down in any community, raises the price of land all around him. If he gets eighty bushels of corn to the acre, and makes it worth three hundred dollars, his neighbors will not long be content with twenty-five. Big crops raise the reputation of the land. They tell every year upon the purse of the owner, and when he wants to add to his acres, and comes into the market to buy adjoining land, he cannot buy at the old prices. He has been all the while working against himself as a purchaser, and raising the price of his neighbors' farms. Just beyond Shadtown there is a big plain, where any quantity of land could have been bought twenty years ago, for fifteen to twenty dollars an acre. It was difficult for farmers to get rid of it, even at these prices. It is now worth an hundred dollars an acre. A fish oil factory in the neighborhood made cheap manures, and started a better style of farming. Here in Hookertown, we have not only cheap fertilizers, but a constantly increasing class of reading and thinkin'

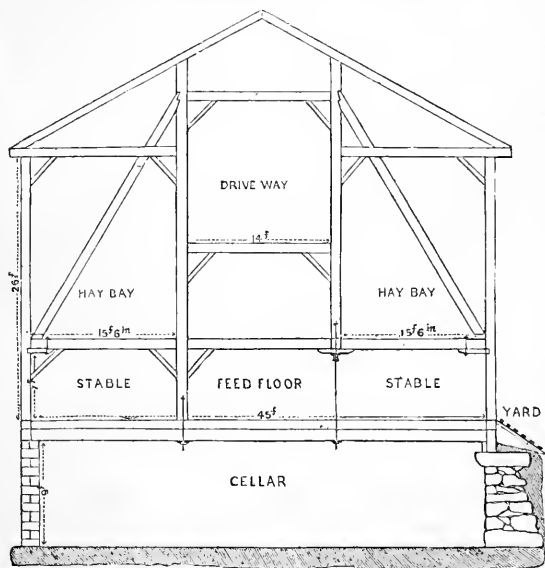

Fig. 2.—SECTION OF BARN.

cost are a little 'wharfing up' at one end for the drive-way, or approach to the barn-floor.

Much might be said on the general economy of building barns to save expense, and at the same time secure more convenience. Doubtless any one who rightly appreciates the value of a barn cellar can readily see the superior advantage of a cellar free from posts, over one with two rows of posts, as is most common, or the better way of only one row of posts. But with one row of posts there is the necessary expense of having large sills under the common ones, and also long braces, which are somewhat in the way; besides, one row of posts fails to give the frame proper and even support, and either way will cost quite as much as if supported by rods, etc., put up with proper architectural skill. And yet allowing that it would cost for each post five to ten dollars more to support, it would be money well invested."

Tim Bunker on Real Estate in the White Oaks and Hookertown.

"Taint worth so much by a hundred dollars as 'twas eight years ago, when you married the widdler," said Uncle Jotham Sparrowgrass to Kier Frink, as he stopped his horse to blow on Hookertown street yesterday.

"That's so," said Kier, sticking his old boot into the high wheel of his coal cart, for a rest. "But what's a poor feller to do, when property is all the while fallin', and money 's gettin' more skase? Ye see, when I fust went into the White

farmers, who are all the while putting more brains into the soil, which starts crops faster than hony fish. The Farmers' Club is active, and Deacon Smith and Mr. Spooner keep talking, and Seth Twigg smokes out a good many errors in the course of the year. The draining and the manure, and the new tools and seeds, tell their own story, and, as Jones says, "everybody has a hankering arter land." Farms, like putty, has ris. The *Agriculturist* subscription list has ris also, from one to forty, and real estate agents, if they were fair, would vote it a medal. Hoping they will do the clean thing, I am,

Yours to command,

TIMOTHY BUNKER, Esq.

Hookerton, June 15, 1898.

More Turnips Wanted.

The high price of ruta-bagas in our city markets, the past spring, (two dollars a bushel at retail,) shows clearly that the supply is not equal to the demand. Ruta-bagas can be raised for twenty-five cents a bushel, and the round turnips, as a stolen crop, for less than ten cents. Farmers away from the large markets pay very little attention to this crop. It ought to have a place upon every farm where hogs and cattle are kept, without reference to city markets. Of course, if turnips go up to 75 cents or more a bushel, it will ordinarily pay better to sell them than to consume them upon the farm. But if prices are low, the farmer always has a good market at home. Most of the turnips raised in England are turned into beef, mutton, and wool, before they are sold. Our climate is not quite so favorable as the English for this crop, but we have never found any difficulty in growing satisfactory crops of all the varieties of turnips. They are not nearly so nourishing as the potato, but the yield is four or five times greater. They are valuable to feed to milch cows along with hay, Indian meal, and oil cake, good for fattening bullocks and swine, and exceedingly profitable for sheep, whether one is making mutton or wool, or raising lambs. We have found them valuable for home consumption, and do not like to be without them, even when we have plenty of beets and carrots. The old method, inherited from our English ancestors, no doubt, was to yard sheep at night for several weeks upon the piece of ground to be sown to this crop. Just before the 25th of July the ground was plowed and harrowed very thoroughly, and sown with wood ashes. The turnip seed was sown broadcast, and put in with a garden rake, or bush harrow. The crop had no cultivation, and yielded from four hundred to eight hundred bushels to the acre. The soil usually selected was a sod or a fresh clearing. Upon new ground, the turnip is usually of fine quality, and the yield large. The yarding of sheep is a good preparation of the soil, but the broadcast sowing is discarded by the best farmers. No crop pays better for sowing in drills, for thinning, and for frequent cultivation, until the leaves are in the way of the cultivator. The drills should be from fourteen inches to two feet apart, according to the size of the variety sown, and the object for which they are raised, with sufficient space left between the roots for hoeing. Some of the strap-leaved varieties make short leaves, and the "Cow-horn" grows quite high out of the ground with a long tap-root. These may be set in the thickest drills, and quite close together in the drill. Though the hoe is quite necessary in the first weeding of the crop, nearly all the cultivation may be done with the harrow

and cultivator, and the aim should be to use horsepower as much as possible. This is essential to cheap turnips. After the leaves cover the ground, the crop may be "laid by." The ruta-baga is much more solid than the common white turnip, and requires a longer time to grow, and a richer soil. It is frequently sown in June, but the first week in July is early enough, on warm, loamy soils, especially if the crop is raised for food. This turnip is frequently grown upon ridges, and the manure placed in the center of the ridge, and covered with the plow. By the sea-shore it is a common practice to use rock-weed, freshly gathered, for this crop, bony fish, or the refuse after the oil is pressed out. Fish guano and superphosphate of lime are among the best manures for turnips, whether applied broadcast and barrowed in, or directly to the ridges. 500 pounds to the acre of the superphosphate or a half ton of the guano will be a good dressing. If the ruta-bagas are raised for market, they should not be allowed to grow too large. Roots from three to five inches in diameter sell much more readily than those of twice the size. They are easily kept in pits, or upon the surface of the ground, covered with straw and earth. The strap-leaved turnips are raised at very small cost, by sowing among corn at the last cultivating,—say the first week in August. If the corn is cut up by the roots early in September, the turnips have the ground the rest of the season, and frequently make 400 or 500 bushels to the acre on good soil. Let us have cheap turnips this year.

HAYING IN "CATCHING WEATHER."—Last year the weather was characterized as "catching,"—and from the beginning one would think this year had caught something, for it has been as showery and drizzly as the last along the sea-board. Almost anybody can make hay when the sun shines, but the problem may be presented to make hay when it does not shine. With the mowing machine, the tedder, horse-rakes, and hay caps, an active man of fair judgment may succeed, with a mere modicum of the direct heat of the sun. The principle is, *continuous drying*. The lack of sunshine must be made up by stirring, if the atmosphere is a drying one, and here a good tedder will be found most useful. Long exposure of clover to the hot sun is ruinous; the heads and leaves will fall off, and these constitute the best part. Grass containing clover should be dried rapidly until thoroughly wilted, and while still green and hot, cocked up. If it has a little sunshine when first cut, it will cure in ordinary catching weather in the cocks, covered with hay caps, provided it can be opened out and shaken up now and then. The hay will be surprisingly green and good, and it will not require much labor to make hay in this way.

On His Last Legs.—(See next page.)

The City of New York offers a market for almost every thing, from the glittering gems that dazzle the eye in the show cases, to the miserable rags that the squalid poor cast off, and the more abject still pick from the gutters; even the street sweepings bring money. If the fame of some wonderful exploit on the turf or trotting course makes a horse valuable, here he finds a buyer, and \$5,000 or \$30,000 will not long stand between the fancier and the object of his ambition. From such transactions as these, the trade in horse flesh drops off rapidly

until we reach the more modest figures of \$500 to \$1,000 for good animals or for pairs of horses, and comparatively few are sold even at these figures, the majority of sound horses selling at perhaps \$150 to \$300 apiece, or \$300 to \$500 per pair. Still there is ever a ready market for horses, no matter how crippled and broken-down. It is this trade which brings out that phase of human nature which renders horse dealing, as a profession, of such disrepute. In fact, the rarest development of the peculiar characteristics which this calling seems to elicit, is to be found where the very poorest classes of horses are brought for sale. Our artist was so struck with the scenes and the surroundings of an up-town horse market, that he quietly employed his pencil in portraying them. They have a little the air of caricatures, but this is owing to the difficulty of otherwise vividly presenting the reality. The auctioneer and his associates who manage the thing would feel greatly incensed should we impute to them other than the most high-toned sense of honor in their way,—and we do not. We owe them thanks for the opportunity we have of exhibiting this interesting stage of horse life. The pampered pet, the pride of the park drive, the faithful servant and drudge, has served many masters, and a broken-winded, spavined, knock-kneed cripple, he is brought once more to the auction block. He has passed through 12 to 20 years of varying and eventful scenes. Soon will follow the last—the drop-scene. Now for the last time he passes under the red flag, and "going—gone"—is enforced by the auctioneer's hammer, and followed by a change of masters.

The central group needs no further explanation. No. 2 represents the test applied to cart-horses. The wheels of a truck being blocked, it is loaded with men and dragged up and down the sandy way. No. 3, an animal with a fine Roman cast of countenance, not recently shod, nor suffering from too high feed, comes up, going a little lame. "There's nothin' the matter of 's this hoss, Mister, but a verry slight blemish on his hign fore-leg; otherwise he's a perfect' hoss." No. 4. "Here, gentlemen, is a splendid animal for the saddle, and no doubt a good feeder." Any one who doesn't believe it is at liberty to offer him a peck of oats. We suppose No. 7 must exhibit unmistakable marks of having seen better days, for the word comes from the stand, "Gem'en, this 'ere Shetland belonged to a young lady on 5th Ah-vner, and she sold him 'cause she was goin' to You-rope." No. 8 is announced as "a good stepper," and exhibits his accomplishments to the slight inconvenience of bystanders. The public appeal having failed to bring the desired response, or as a personal favor, No. 9 is offered at private sale, and at a bargain. "Well, I tell you what, Mister, there is one great beauty about that hoss—an that is, he's all together." The portraits already given would be incomplete without those on either side of the central picture, Nos. 5 and 6.

The poor horse endures this old age of suffering and toil because his value is solely in his labor. In Europe, the societies for preventing cruelty to animals have for years been endeavoring to remedy this evil, by encouraging the consumption of horse flesh as food. This is now so far on the increase in some European cities, that it really seems as if there might be a market for the flesh of old horses. It is said that old, well-fattened animals are much tenderer and better than young ones, and there is really no reason, except in our prejudices, why we who eat swine might not eat horses.

Beautiful "Foliage Plants."—Begonias.

The old *Begonia fuchsoides* and *B. incarnata* have long been prized by cultivators for their flowers, and they still remain among the favorite tenants of the green-house. It is comparatively recently that a set has been introduced, which are valued more for the beauty of their foliage than that of their flowers. The first notable one of this kind was *Begonia Rex*, with its enormous leaves of rich green, with a broad silver zone. One of the first plants of this sent to this country came from Kew to Cambridge, and we well recollect the pride with which Doct. Gray placed the plant in a proper light, to show its beauty, and our astonishment that a leaf could be so charming. Greater was our astonishment to find that this plant could be propagated from the leaf, and that from a leaf planted in a pot a dozen plants would spring up. But all this was years ago; now leaf propagation is a common thing, and *Begonia Rex*—then so rare and so wonderful to us—we have seen cut out of Ellwanger & Barry's green-houses by the armful to get it out of the way. Since then the reign of *Rex* has been contested by many others; new species have turned up, seedlings and hybrids have been obtained, until it would take a long list to catalogue all the fine Begonias. The shape of the leaves—they being unequal sided—is quaint in all; in some, the leaf stalk and under side of the leaf are clothed with long hairs, and have the appearance of a beautiful crimson plush; in others, the colors of the surface of the leaf are strikingly beautiful, often like the richest satin, and again presenting a metallic appearance that is really charming. Messrs. Olm Bros., of Springfield, Mass., imported a lot of the finer sorts last year, and sent us specimens of the leaves. Where all were so beautiful it was difficult to choose, but we selected two that we thought best adapted for illustration, and we think that our artists have succeeded in giving an idea, as well as can be done in black and white, of these two varieties. Though chiefly seen in green-houses, these finer Begonias are admirably adapted to out-door decoration, and did florists properly put them forward they would soon take a high rank among what are absurdly called "foliage plants." For hanging baskets, rustic vases and stands, they are most admirable, and were they cheap enough, as they might easily be, they would come in play for decorative beds upon the lawn. Of course they are not at all hardy, and neither is *Colerus* and others of our ornamental plants, though one species, *Begonia discolor*, usually stands the winter in France, and doubtless many of these fine sorts, when tested, will be found to winter in an apartment where they can be

kept from freezing. The Begonias do best in a rather substantial soil which contains a good share of vegetable matter. The name was given in honor of Michel Begon, a patron of botany, who lived in France in the 17th century.

BEGONIA PICTURATA.

Paths in Public and Private Grounds.

The old gravel walk has had its day. The scuffling, raking, dressing, rolling, weeding, and other matters of care, are to be avoided, if possible. A good gravel for making walks is only to be found here and there, and in the

put down, it does not allow the growth of any weeds, and requires no fussing. There is an elasticity about a path of this kind that makes it especially pleasant to walk upon. There is an asphalt walk across City Hall

Park, and in crossing from our old office to our new one, we prefer to go a little out of our way for the sake of enjoying this walk. Thousands of people traverse it daily, and it retains its shape without losing its elasticity. It was put down with a layer of coarse gravel and tar, then coal ashes, and upon the top a layer of fine gravel or coarse sand. The friend above alluded to simply grades his walks, flows them with gas tar, and then puts on all the sand that will stick. In a few days the walk may be used. Paths of tar, etc., have been tried in Central Park, and the Controller, Mr. A. H. Green, in his recent admirable report says—cautiously, it is true—as follows: "Several pieces of walk have been laid in the Park during the fall, with a composition of tar, gravel, and cement, coal tar having been first used, and subsequently the ordinary tar of commerce. The appearance, when properly mixed and laid, is thus far the most satisfactory of anything that has yet been tried: it is readily formed and shaped to meet the various conditions of the ground through which it is laid—it is compact and pleasant to walk upon—it is claimed to be free from dust, and that it is not so materially affected by the heat or cold as to diminish its practical usefulness. It is not intended to express any opinion

as to the merits of this combination of material. If experience proves that it answers all that is promised, it will be very serviceable in all places where walks of a rural character are desired, especially on those which, from the steepness of the acclivity, are liable to wash."

Now, we have thus replied to many letters, and told all we know about walks of this kind. We cannot find that there is any exact formula for making them. Doubtless gas-tar with sand, cement, coal ashes, gravel, or any similar substance, will harden into a good walk. If any of our readers have any experience in this matter that will benefit others, we hope they will kindly communicate it.

Fig. 2.—BEGONIA—QUEEN OF ENGLAND.

majority of cases a walk instead of being a pleasure is a nuisance. Some years ago we published an account of the experience of a friend in making walks with gas tar and sand. Some combination of this kind is destined to supersede gravel. It is permanent when once

was cut down to the ground, but the stump was not removed. No signs of vegetation were visible until the present spring, (1868), when, after remaining dormant for seven years, new shoots appeared from the roots. We have known plants to remain in this way for a year only.

A LONG SLEEP OF A PLANT.—The following remarkable case of suspended animation in a tree is recorded by Shirley Hibbard in the Gardener's Magazine, (London), as having occurred under his observation. A large bay-tree having been injured by the winter of 1860-61,

The Grape Vine—How it Grows and What to Do with it.—6th Article.

Almost every yard or garden in the suburbs of our cities and towns has a grape vine, if no other fruit-bearing plant, and every year thousands of vines are planted on this small scale, one or two in a place. Amateur gardeners are impatient, and will start with large plants, and we have seen this spring numbers of men taking home vines that were fit only for the brush heap. These vines are set, and a jobbing gardener comes each spring to "prune." The man is paid to prune, and is, of course, bound to cut something, which he does without any definite notion of what he is doing. The result is that in a few years the vine is mainly a mass of old

Fig. 15.

and useless stems, and the owner likely sends a note to the *Agriculturist* to ask what he shall do with it. It is to prevent such mistakes as these that we have written a series of articles, which are not intended for vineyardists, but for those who have no knowledge at all upon the subject of planting and growing vines. The methods of training already described, as well as others to be presented, are all suited to garden culture. Circumstances vary much in different gardens, and it is not always practicable for one who would like to grow a vine on the Horizontal-Arm plan, to follow the directions that have been given. It often occurs that a trellis upon a house or fence must be several feet above the ground, in which case the arm or arms must be started high up on the stem, instead of within a foot or so of the ground. This will be further illustrated when we come to the subject of covering screens and arbors.

A modification of Horizontal-Arm training, called Guyot's System, is much liked by some good cultivators, while others do not approve of it. The system, like that described last month, requires a vine with two good canes to start with; one of these canes is pruned to two buds, and the other is cut off at the length of two feet, and laid down as a horizontal arm. From the arm upright shoots are trained for fruiting, and stopped when about two feet high, as already explained. The shoots from the two buds are trained upright and allowed to grow about five feet high, when they are pinched. The laterals are kept pinched, and every pains taken to secure strong canes. The vine in autumn will present the appearance given in figure 15. In pruning a vine like this the horizontal arm is cut away entirely, and the lower of the two upright canes bent down to replace it: this cane is to be cut of the proper length, which the second year may be four feet, and the other upright cane cut back to two buds. In this system we have one horizontal arm, which is renewed each year from an upright cane grown for the purpose. This plan, of which a mere outline is given, is fully elaborated in Mr. Peter B. Mead's work on Grape Culture, from which the above illustration is borrowed. In some vineyards started on the Horizontal-Arm system, we have seen a sort of compromise between it and other plans carried out, until it became

nearly the old Alternate-Renewal system. Instead of pruning the upright canes on the arm back to two buds, (see last month), a portion of them are pruned longer or shorter, according to their strength, and two, three, or more feet left. The next season these canes are expected to produce fruiting shoots along their whole length. This breaks up the system, as in cutting back these canes after they have fruited, there is no certainty of finding a bud to cut to, to renew the cane. We have given in these articles only the principal modifications of which the Horizontal-Arm is susceptible, and must leave it to notice other and different methods of training.

A word on the care of vines during the present month. Cultivation must be followed, and the soil kept clear of weeds by hand or horse-power. Keep the laterals in check, as already described in April. This operation, so often neglected, is absolutely necessary, in order to get a strong cane for future operations. Mildew, if it appears, is most successfully treated with sulphur, which should be blown upon the vines, especially upon the under surface of the leaves, by means of a bellows made for the purpose. Remove the larger insects by hand-picking. An insect will often take off the end of a growing shoot as neatly as if it were pinched. When this occurs, allow the upper lateral to grow and prolong the shoot, or remove it altogether, and allow the upper bud, which would have otherwise remained dormant until next year, to start.

A New Carriage Gate.

A gentleman who lives in the upper part of N. Y. City has contrived a carriage gate which answers his peculiar requirements, and thinking it may be of some use to others, we give an illustration and description of it. It would obstruct the sidewalk to have the gate swing outward, and as the ground immediately within the entrance rises, it would not be practicable to have it open inward, without making considerable excavation; so in this dilemma he arranged it to slide. The gate is made all in one piece, well braced, and like a section of picket fence. The illustration is taken from the inside of the grounds, and shows the gate partly open. The gate-way is represented as closed by a well-

CARRIAGE GATE.

braced bar, which is arranged to swing open towards the inside; upon the top of this bar is a rail upon which the gate moves by rollers, after the manner of a sliding barn door. A piece of scantling supported by posts, and bearing a rail, is placed to receive the gate when open. This gate is very easily opened. It is rolled away from the gate-way and the bar is pushed open—the bar being so hung that it will require no fasten-

ing back. The opening can all be done without moving from one spot. The bar, when closed, rests upon a post placed to receive it.

The Treatment of "Bedding Plants."

By "bedding plants" we mean those tender things that are put out for the effect they will produce in summer. Among these we include those valued for their flowers, like the *Verbenas*, as well as those, which, like the variegated *Pelargoniums*, *Cinerarias*, and *Coleus*, are grown for their foliage only. Many think that when they have set out these plants they have done their duty by them. This leads to bad effects, and we see miserable attempts at bedding. *Verbenas*, *Ageratums*, and all the flowering ones, need pegging down, and constant care to make them show their best. A daily attention is required, and one who wishes to make a show with these plants should keep them in good trim. Each branch, as soon as it is large enough to be blown about, should be held in place by some kind of a "peg." A willow twig bent like a hair-pin is as good as anything we have tried for the purpose. The "foliage plants" generally grow lanky and make anything but a desirable show, all for the want of the knife. Cut back freely all the kinds that do not seem disposed to bush out. Tolerate no *Pelargoniums* (or *Geraniums*, as some will call them) on stilts. Cut back the *Coleus*, and make it grow broad rather than tall. *Cinerarias* and *Centaureas* are disposed to run to flowers—cut them back. Keep all bedding plants under control. If they are in a bed upon the lawn, cut those upon the edge of the bed back so that the plants near the center will have a fair show. Do not be afraid of using the knife freely upon any of them.

The Effect of the Graft upon the Stock—Graft Hybrids.

It has been accepted as a law by horticulturists, that the graft produces no effect upon the stock into which it is inserted, other than, it may be, to communicate disease. A number of cases have been from time to time observed, which would go to show that there are excep-

tions to this rule. In May 1867, Meehan gave in the *Gardeners' Monthly* an account, with an illustration, of a pear which had been grafted upon a Mountain Ash—which, by the way, is not an *Ash* but a kind of Pear. It is a well-attested fact, that seven inches below the junction of the two, a pear shoot appeared upon the Mountain Ash stock. Mr. Darwin, in his recent work on the Variation of Animals and Plants, has brought together a number of facts of similar import. An-

other curious point upon which Mr. Darwin in this work furnishes strong evidence, is the production of graft hybrids. By this is meant the commingling of the peculiarities of the stock in the graft, manifested in flowers and fruit intermediate in character between the two, after the manner of hybrids produced from seeds resulting from fertilization with foreign pollen. Adams' Labrum, it is pretty well established,

originated in a shoot from a common Laburnum, with yellow flowers, into which the Purple Laburnum had been grafted. The same tree produces flowers intermediate between the two sorts, and those also which have reverted to one or the other parent form. One cluster will bear both yellow and purple flowers, and a single flower has been seen divided into halves, one half being purple and the other yellow. Instances are recorded in which blue and red hyacinth bulbs had been cut in two, and the halves of the blue and red grew together and produced a united stem with flowers of two colors on opposite sides, and not only this, but flowers in which the two colors were blended together. Red and blue potatoes have had their eyes grafted reciprocally into one another, and some of the tubers resulting from the plants thus produced, showed indications of a cross. Mr. Darwin does not cite the case of our sweet and sour apple, but does that of a French variety still more striking. Mr. Barry long ago suggested that our much-talked-of sweet and sour apple was a graft hybrid. We thus briefly allude to this interesting subject, to direct attention to cases that bear upon the point. Isolated facts that in themselves seem to have but little importance, when collected and classified as they are in this remarkable work of Mr. Darwin, to which we have referred, often tend to give us new views of the workings of nature.

Sticks, Strings, and Wires.

Our Pennsylvania friend will say that sticks and strings in the garden are "agin' nater." Of course they are—and so is all gardening. If one attempts anything at ornamental gardening, if it be only one plant in the front yard, we wish him to do it well. If it be only a Morning Glory against the house, let him give it a good strong string to run upon. Attention to or neglect of sticks and strings makes all the difference between a well-kept place and a shabby one. A slight support will often make a plant show at its best, while the same plant if left to be whipped about by the winds and beaten down by the rains would be a nuisance. Do not let these artificial aids be conspicuous. The stores have green sticks with white tops for Dahlias and such plants. Sticks like these are an abomination. So are the complicated trellises which come to New York by the cart-load. Where supports are to be used, keep them out of sight; common sticks with the bark on are as unobtrusive as anything, but if sawed stuff must be used, paint it of some drab or brown color. Painting of these sticks is easily done. Get the painter to mix a lot of thin paint; then have the tinman make a cylinder as long as the stick to be painted—a sort of stove pipe with a bottom to it—put the paint into the cylinder, and dip the sticks. The painting can thus be done with great rapidity and better than with a brush. As to strings, a great variety of material may be used. Don't let it be too strong, only have something always at hand, even if it be the ravelings of an old stocking. A straggling plant, or lot of plants, can often be made comely by simply drawing a string around them. We like to have small galvanized wire handy, and find it of essential service in the garden. Crinoline is no respecter of plants, and where there is a travelled path near a border the plants are likely to get the worst of it. We stretch a wire about a foot above the surface along the edges of the border, and defy crinoline to do its worst. Wire of this kind comes in nicely for all sorts of

climbers; it is cheap, and much more permanent than strings, which are always too tight or too slack. For general tying we have found nothing better than a good, soft, cotton twine—not the grocer's article, which is more starch than cotton, but a well-made, honest, pure cotton twine.

Have You Any Chrysanthemums?

If any one who has a garden has no Chrysanthemums we advise him to get some at once. It is not too late, and any florist will give him a set at a small cost. Put them out and then give them good cultivation. Because they only bloom when everything else has done they are too often neglected. We appreciate them when in flower—flowering after the hard frosts have killed all the tender plants—but we do not always think in time that it is the summer care that gives us this autumn harvest of bloom. How glorious they are in the November days, bringing back memories of summer! Let us, then, now prepare for this enjoyment. The first thing to do with a Chrysanthemum, after it has fairly started, is to snub it. Remorselessly pinch off its top, and it will give thanks for the treatment by throwing out a dozen side branches; pinch these again, and again, until a compact bush is obtained. It will seem hard to the inexperienced to do this, but in autumn he will be rewarded by such a profusion of flowers that he will regret that he did not pinch a little more. We are now speaking of Chrysanthemums out of doors and in common gardens; those who make show plants for the exhibitions grow but one or few flowers on a stem, and aim at a different object. We go in for a perfect blaze of flowers, without regard to the perfection of individual ones. Give the sun of Indian summer something to reflect its own rich light—therefore let us have more Chrysanthemums.

A Word About Budding.

We have probably a dozen or twenty letters asking us how to bud. Some might consider it an annoyance to be asked to repeat, year after year, the very elementary things of horticulture. We do not. The *Agriculturist* is for the general public, and what its readers ask for they shall have—so far as we are able to supply it.—Now about budding. If our correspondents could go and see a nurseryman put in one bud, they would learn more about the operation than from all the descriptions that were ever written. If they cannot see the thing done, we will do the best we can to help them. The bud used in this kind of propagation is formed at the base of a leaf—in its axil, as the botanists say. It has within it all the possibilities of a branch. If left where it is, it might become a branch. Just as the seed is planted in the soil we take this bud—which is for our purposes a seed—and plant it, not in the soil, but in another tree. The mechanical operation is so simple that a boy or girl of twelve years can do it. Stocks fit to bud are the first requirement: i. e., those in full growth, and of which the bark will "run," or easily part from the wood. Buds well developed are the next. Cut the twig for the "stick of buds" from the variety desired to propagate; cut off the leaves, *leaving the leaf stalks, and do not let it dry*. Make a T incision in the bark of the stock, on the north side, and as close to the ground as a smooth piece of bark can be found; cut out a bud from the "stick of buds" with an inch or inch and a half of bark, lift

the flaps at the angles of the T incision of the stock, and push this bud down under the bark; cut the bark of the bud off even with the horizontal part of the T incision, and then bind it tightly with bass bark, corn husks, old rags, or whatever is at hand, of course leaving the bud exposed. In the majority of cases the bud will next spring be found alive and ready to grow, when all of the stock above it must be cut away. Now, we have briefly described what we have several times given before with figures. However much we may wish to do so, we cannot give the same illustrations over and over, and those friends who do not find here sufficient directions to enable them to bud had better send for the *American Agriculturist* for July, 1866.

Do You Belong to It?

By "It," we mean the American Pomological Society, and by "You," we appeal to every fruit grower who can afford a dollar a year for the promotion of pomological knowledge. The Society is a National one, and its aims are the development of American Pomology, in its broadest sense. It collects what is known as a guide to those who would follow in a trodden path, as well as to that large class of experimenters who would essay the unknown. The President of the Society is that venerable—we had almost written revered—pomologist, Col. Marshall P. Wilder, and his list of officers and members includes the fruit growers of the country. Its meetings are held every two years—(next year in Philadelphia), and its "transactions" are more important than its meetings. Each member who pays two dollars gets a copy of these transactions, and they contain the pomological knowledge of the country "biled down." The fruit committee, comprising such men as Downing, Barry, Elliott, and others of that stamp, make up the list of fruits—a catalogue "raisonné," as the French say—which shows at a glance the standing of the different varieties of fruits in the various States. We do not place any high estimate on the reported discussions, but this catalogue or fruit list is of great value. It is made up by men of the highest ability, men who work solely for the good of the cause, and it is the business of every fruit grower to see that he contributes his mite towards the publication of such valuable labors. Let us all go in and make the American Pomological Society a grand success.—N. B.—Thomas P. James, of Philadelphia, Pa., is the perpetual Treasurer.

ORCHARD GRASS IN LAWNS.—Orchard grass is valuable in its place, but that place is not on a lawn. There can be no more ridiculous exhibition than that we see from our office windows in City Hall Park. Some official goose last year sowed the "grass plots" with Orchard Grass, and this year other geese have been trying to hack the grass into something like subjection. When the city officials succeed in making a lawn out of Orchard Grass we shall let our readers know it. Persistent mowing is the best thing that can be done with it, but this will hardly make lawn grass of it. Better root out the ugly tufts altogether, and put in Red-top, June, or Blue Grass, or any other kind that does not make tussocks. The two worst among our common grasses for a lawn are Orchard Grass and Timothy; no mowing will break up their tendency to form stools or tussocks. With Red-top, June or Kentucky Blue Grass, or Italian Rye Grass, a dense and velvety sward may soon be formed by frequent mowing and rolling.

FORSYTHIA VIRIDISSIMA.

Early Flowering Shrubs.

It was the singular good luck of Mr. Fortune to introduce into cultivation a number of plants that pleased the public taste, and they became at once popular. Among the Chinese plants introduced by Mr. F., is the Forsythia, a shrub named in honor of an English gardener, Mr. Forsyth. It is hardy, is easily propagated, blooms very early, and is handsome when not in flower—characters which tend to make it popular. The species generally cultivated is *F. viridissima*; another, from Japan, *F. suspensa*, is comparatively rare. The Forsythia forms a clump of slender, willow-like twigs, which, in April, before the leaves appear, are quite covered with hanging flowers, of the size and shape shown in the engraving. The color of the flowers is a bright yellow—indeed, almost too yellow, when the shrub is used very abundantly. The leaves are long and narrow, rather firm, and of a green so deep and rich that the plant is aptly called *viridissima*. In autumn the foliage turns of a dark purple, not so brilliant as we see in many other leaves, but yet not without elegance. It is a useful shrub to train against a fence or low trellis, being almost as manageable in this way as a vine. It is propagated readily from cuttings and layers, and by suckers from old plants. The Forsythia belongs to the Olive Family, which includes of our ornamental shrubs the Fringe Tree (*Chionanthus*), the Privet, and the Lilac. Among early flowering shrubs the old Japan Quince, (*Pyrus Japonica*), still holds its well-merited prominence. Indeed, there can scarcely be a more brilliant sight than a good bush of this in full flower.

Though not so early as these, an old, and with us favorite shrub, is the Bladder Senna, (*Colutea arborescens*). It will be seen at once from the engraving that this belongs to the Pea Family. The clusters of yellowish flowers are pleasing, but the shrub is most attractive when in fruit. The pods are curiously inflated, and when suddenly compressed, burst with a slight "pop," which makes it a favorite shrub with both old and young children.

TREE-BOXES.—Many persons in cities and villages paint their tree-boxes of a bright green. This is in the worst possible taste. The green of the box detracts much from that of the tree, especially when the tree is young. The color of a tree-box should be one which shall be as inconspicuous as possible; the box is a necessary evil at best, and ought to be kept out of sight as much as possible. Some warm drab or gray—some color that is not very unlike that of the trunk of the tree, is much better than a glaring green. We look for the time when our people will be civilized enough to allow tree-boxes to be dispensed with, but as long as heathens will hitch their horses to

trees, and boys will try their jack-knives, we must furnish boxes for horses to gnaw, and boys to whittle. But whatever may be the kind of box used, please don't paint it bright green.

Liquid Manure in Gardens.

But little attention has been given in this country to the use of liquid fertilizers, while in Europe they are classed among the gardener's important aids. In the market gardens around Paris, the liquid manure tank is regarded as an essential part of the establishment. Brick tanks thoroughly cemented are sunk in a convenient part of the grounds, and considerable expense is incurred in arranging a system of underground pipes to convey into it the urine and other liquids from the stables, and the slops from the house. The manure from the hen-houses and dove-cots finds its way to the tank, and privies are arranged for the laborers with movable boxes, the contents of which from time to time are emptied into the tank. There is hardly a farm or small place in the country on which there is not a great waste of fertilizing material, and the example of the French gardeners may be imitated with profit. A sunk cask may be made to serve as a receptacle for these usually wasted fertilizers, and the wash from the house be led into it by means of drain tile, or even a conductor made of boards. That attention is being turned to the subject of liquid manures is shown by several letters asking about the best means of distributing it. In Europe a wheeled apparatus made of boiler iron is used, but a barrel or cask mounted on wheels would

COLUTEA ARBORESCENS.

answer every purpose, and this may be moved by hand or horse-power, according to its size. The discharge pipe should be arranged after the plan of the street sprinklers used in cities. What is wanted is something to divide the liquid and distribute it along the row, much after the manner of a watering pot. The shape of this sprinkler will depend upon the surface to be watered. It may be a tin cylinder, with holes near the ends, and of a proper length to water two rows at once. The sprinkler should be connected to the barrel by a short piece of hose, which will allow its height to be altered as needed. The discharge may be regulated by a valve placed over the orifice, upon the inside of the cask. A block of wood with a piece of leather on one side will answer for the valve; this is to be held in place by a leather hinge, in a manner that will allow it to be lifted by means of a string attached to it, and which passes out at the hole through which the cask is filled. The valve should be weighted with a piece of iron or lead, to insure its closing tightly. The discharge is regulated by pulling the string.

In July, 1865, we illustrated a pump which would serve for raising it from the tank or reservoir, to the distributing apparatus. If the liquid is to be distributed by a sprinkler, care must be taken to use only the clear portions, as sediment of any kind would soon close the holes. The contents of a manure receptacle, like the one we have referred to, will vary in character, and no rule can be given as to the amount to be used. Excessive strength must be avoided, and if that in the reservoir is highly concentrated, it should be diluted. Manure waterings should not be given in very dry weather.

THE HOUSEHOLD.

(27 For other Household Items, see "Basket" pages.)

Sea-side Fare—The Lobster.

Those who live near the sea-coast have a number of articles of food quite unknown to those who dwell inland. A visit from the West to one of the Atlantic States owes much of its novelty to the different fare that these sections present. Thinking that it will interest our inland friends to see what

LOBSTER—(*Homarus Americanus*.)

their salt-water neighbors feed upon, and at the same time give us a chance to say a word upon the proper use of the things themselves, we begin a series of articles on sea-side fare with the lobster. Railroads are great levelers, and they take our sea-coast things so far inland that our western friends often get lobsters, oysters, and the like, in exchange for the prairie-lens and pigeons they send us. But to the lobster. The engraving gives the general look of this, the largest of our crustaceans. Students of Natural History know that crustaceans include lobsters, crabs, spiders, and all those animals that leave their skeletons on the outside of their bodies. We will not discuss the lobster scientifically, but merely as an article of food, and describing it thus, we shall use terms that will shock the naturalist—but we won't mind about that. What is popularly known as the "body," has the head, eyes, and long feelers, at one end, and at its lower side bears the feet, the two forward ones of which are enormously developed into "claws." These the lobster uses to catch and hold its food, and they give a formidable look to the animal. One member of the "claw" or pincer only is movable, and this, as soon as the animal is captured, is prevented from doing mischief by means of a wooden plug put in at the joint. The remaining legs are small. The "tail," or rear end, is jointed, and bends as shown in the engraving. It is furnished below with appendages which serve the animal in locomotion, and are used by the female for holding the eggs. Lobsters are found all along the New England coast to New York, and are taken in simple traps baited with stale meat or fish. When alive, they are olive-green, and are very pugnacious. They are kept from injuring one another by plugging their claws, as already mentioned. It is only in its living state that the lobster should be purchased as food—unless one is sure of the person who cooks them. There is probably no article of food which grows stale so soon as the lobster. Healthful when fresh, it is most pernicious when stale—and it becomes stale very rapidly. Buy the lobster alive and kicking. Never purchase a dead lobster, and never a boiled one, unless the reputation of the seller is established. Having the lobster alive, dump him suddenly into a large kettle of boiling water, well salted. Of course the crustacean will kick a little, but it is the quickest way to dispose of him, and much better than the English one of putting him on in cold water and gradually bringing it to a boil. Half an hour's boiling will be sufficient in most cases. The olive-green will be turned to a bright scarlet,

and the animal is ready to be opened. Break off the "claws," and crack them edgewise with a mallet, and take out all the meat. Separate the "tail" from the "body," and then by breaking off the edges the upper thick shell will be easily removed from the lower and thinner encasement. The solid "tail" meat will then be exposed. It will be found that there is a longitudinal strip at the upper surface of the tail part, which will readily separate, and beneath this there is a dark intestine, which can be easily removed; all the rest is clean meat. Now we come to the body part; a pull separates

the upper shell from the portion to which the legs are attached, and there is nice picking for those who will take the trouble to remove the meat from the encumbrances which surround it. In this part of the lobster is found a greenish mass, consisting of the liver surrounded by fat; this is by many highly prized, and by others rejected altogether. What is called the "lady" is the stomach, which has the reputation of being poisonous—an error, as the "lady" is so unattractive that we cannot conceive that any one would be tempted to eat her. So much for opening the lobster; but we should add that in the female is found the undeveloped spawn as a red mass, called the coral—which is highly valued by many. As an article of food the lobster cannot be called highly nutritious, but when fresh there is no doubt of its healthfulness. All along the New England coast, it is, in its season, a very common Sunday dinner. It is one of those articles that admit of any amount of seasoning. Many prefer a freshly boiled lobster with only pepper and vinegar—others like it only in a highly seasoned salad. To make lobster salad, the lobster should be chopped, but not too fine, and dressed with the salad dressing given in May. In making lobster salad, butter may be substituted for oil, and we think with advantage. Hot lobster is a favorite dish with many. Cut the meat moderately small, put it in a saucepan with plenty of butter and cayenne pepper, and serve when well heated through. About canned lobster—that depends. We have seen it perfectly good, and again when it has produced serious illness. If one eats canned lobster and gets ill, don't let him ascribe it to the lobster, but to the man who canned it.

Preserving Green Corn for Winter.

The canning of corn in families so generally fails that we cannot recommend the trial. The next best thing to canned corn is that which is properly dried. The first essential is good corn, and the next is to dry it carefully before it gets too old. Mrs. M. L. Gage, of Ross Co., Ohio, communicates the following sensible ideas about preparing it: "It is a wonder that so few should have any thing but field corn for table use; and for drying there is a still greater contrast between the common field and the garden varieties. I have been used for years to drying corn. Boil the green ears a minute or two, just to harden the milk, then cut from the cob and spread on a cloth in the sun for two days, taking it in at night; it will then keep any where. When cooked, it is better to soak it a few hours, and boil in the same water. In cold weather all that is wanted for a week or two may be wet. It cooks quicker and tastes better. A little milk and flour boiled in is almost as good as cream. I have not given up drying corn, but for two years past I have put some down in salt, which gives another variety, and is more quickly prepared. At first I had difficulty in freshening it, and then it was comparatively tasteless, but now I boil the corn in one water a minute or two, turn the water off, add a

few sliced potatoes, boil until they are done, drain off the water, and add cream or butter. We think this preparation tastes more like summer corn than the dried corn does. In salting, I cut the green corn without boiling, and pack it, alternating one pint of corn and a small handful of salt. When the vessel is about full, put on a cover that will fit down to the corn, and place a small weight on it, as it must be kept under the brine which it makes from its own juice. I have for the last two years been canning green corn with tomatoes. I use about one-fourth part corn, cooking the two together. I have never heard of but one case where green corn canned by itself did not spoil, but corn and tomatoes canned together is a perfect success."

Household Ornaments.

A lady subscriber from Missouri sends us the following description of a household ornament, which may be made, as she suggests, of an egg shell, or, better still, of the shell of a cocoon. "A pretty 'household ornament' is made of an egg shell by breaking off one end carefully, leaving the opening an inch and a half or two inches in diameter, according to the size of the egg. Protect the edge with a narrow strip of paper put on with gum or glue. Crochet of any bright worsteds an open-work basket, just large enough to hold the prepared egg shell. Put at the edge of the crochet a stiff cord or small wire, and fasten so that the shell may pass in and out when necessary. The cords which will suspend your basket from the center of the top of the window frame. My basket is made of single zephyr worsted, and is finished at the bottom with a little tassel of the same, with two or three threads of scarlet in it. If you choose, put tassels at the ends of the hanging string, and crochet a little ruffle over the strong string round the edge of the basket. I put some rich dirt in my egg shell, and a few kernels of wheat, which grew and freshened our one little room long before there was any thing

CROCHET BASKET.

green out of doors. But now that spring flowers have come I must have a fresh bouquet in it every day." A small two-inch pot, or an egg cup, will answer quite as well as the egg shell, and may be more convenient to those who do not have geese or ducks' eggs. All the grains and grasses look beautifully in these hanging baskets, and trailing plants have a still more pleasing effect.

Delicious Lemon Pie.—Take 3 lemons, grate some of the rind, $1\frac{1}{2}$ pints of milk, 1 cupful of bread crumbs, 4 eggs, $1\frac{1}{2}$ cups of sugar, a little salt. Add the lemon juice last thing, and bake with an under crust.

Do Farmers Eat Enough?

Farmers work hard. Many of them work harder than their horses. A hired man will seldom do it, but a farmer that drives his own team will take occasion to get out a stone, or put a few rails in place that have been blown from the fence, or remove an old stump, or do some one of the score of odd jobs that are always staring him in the face, while his horses are taking a breathing spell. At noon the horses get two hours' rest; but the farmer finds something that calls for his attention. And in the evening, though tired by the labors of the day, there are sundry chores that must be done before he can rest for the night. With morning he is up bright and early, and sees that his horses and other stock are well fed and carefully attended to. But is he in no danger of neglecting himself? If he does nothing but work, and has good digestion, he doubtless gets enough to eat. But a farmer has to think as well as work. He must use his brain as well as his muscles. Nor is this all; the daily cares and anxieties tax his constitution. The work, whether mental or physical, will not hurt him, and he can stand the cares and anxieties—in fact, he who is free from them will not make much of a man. But he must look to his stomach.

One of our country neighbors, a hardy old farmer, came home from the city one cold afternoon and fainted as soon as he got into the house. Why? "It wasn't a very cold day," he said, "and I don't understand it. But the moment I got into the house I knew I was a goner." "Perhaps you had taken a drop too much," we remarked jokingly, for our neighbor is strictly abstemious. "I hadn't tasted bit or drop since I left home. You see I was busy running round—the women want such lots of little contraptions—and thought I wouldn't stop to get dinner." And so he rode home on an empty stomach. As well expect a stove to warm a room without fuel as expect a man to keep warm without food.

The truth is, a farmer nowadays wants the best of food. A professional man tells us he cannot live on the kind of food on which his driver fares sumptuously. But a farmer that is adapting himself to the new order of things is a professional man and a driver too, and if any man in the world needs good food it is the modern American farmer. Does he get it? As a general rule, we think not. A short time ago a number of farmers were cleaning out a creek in our neighborhood, and one of them hospitably asked the writer to share his dinner with him. He was a hard-working, intelligent, well-to-do farmer. The dinner he had brought with him to the woods consisted of apple pie, bread and butter, and cookies. There is not much brain and muscle in such a dinner, and the quid of tobacco for dessert could not supply the deficiency.

Now, why should farmers, of all men, have the poorest description of food and the poorest of all cooking? Half the labor the good wife spends in making the apple pie, cookies, doughnuts, and sweetmeats, would furnish a meat soup fit for a king! Sheep have been slaughtered by the thousand and the soup given to the pigs. Can't a farmer afford to have good mutton soup? We have sheep from which the butcher has been picking out the best at \$3 apiece. The pelts are worth \$1.25. Kill one of these sheep every week. Say it costs you \$2. The legs and the shoulders may be roasted and eaten, and are certainly as healthful as pork. The rest, cut up for soup. Do not ask the women to do it. It is a man's work. Cut it up yourself. Save the legs and shoulders, and also a chop or two for breakfast, if desired. Cut up all the other parts of the sheep into mince-meat, bones and all. The finer it is chopped the better. Then put five or six lbs. of this mince-meat into cold water. Let it soak all night. Then let it be brought nearly to the boiling point, in the same water it has soaked in, and keep it cooking on the stove for several hours till all the "goodness" is extracted from the meat. This makes what the cooks call "stock." We have not traced the process further. "Too many cooks spoil the broth," and at this stage of the affair

the man may safely leave it in the hands of his better half. If she has some black turtle beans, or, better still, some Spanish red beans, she will make a soup that is, in the language of an eminent physician, "positively transcendent!" But beans or no beans, with such a "stock" it is hardly possible to make anything that is not highly palatable and nutritious. Recollect we are a man, and it is just possible that there are sundry little bits of flavoring matter that should be added to the soup that we know nothing about, such as carrots, celery, onions, parsley, and tomatoes. The latter, we can testify, greatly improve the flavor of the soup; and they are so easily preserved that no one need be without them at any season of the year. Bean soup made as follows, from the mutton stock above described, is excellent:

After the meat is well boiled, so that all the juices are extracted, turn off the liquor into a large pan or earthen dish, and when it is entirely cold take off all the fat. When you wish to use it for soup, if it is too strong add boiling water. Season with pepper and salt; and then add the beans. The beans should be soaked over night in the water in which they are to be boiled. They require full four hours' boiling, and water must be added as it boils away, or they will burn and become hard. Mash them in the potas thoroughly as possible, and then pour the meat soup on them. Flavor with celery, herbs, onion, etc., but above all let it be salted enough. Let the soup boil from half an hour to an hour, according to the quantity and how well the stock and the beans have been cooked before.

Preserving Fruit in Bottles.

An esteemed correspondent, who has tried various plans, sends us the following as the one found to be attended with the best success. This, of course, is intended for ordinary bottles with corks. Where some of the many patent jars are used, the sealing process is unnecessary: "Put the fruit in bottles, and add one-eighth of its weight of sugar. Place the bottles, completely filled, in a boiler with a board or other material in the bottom, to prevent the heat breaking them. Fill the boiler with cold water nearly to the top of the bottles, and heat it to boiling. Dip the corks in melted sealing wax and drive them into the bottles. Tie the corks down with wire or twine, and then seal the corked bottles by turning the necks down twice into the melted sealing wax. When sealed, place them again in the boiler, and boil a short time. Put them in a cool place until wanted for use. The necks of the bottles must be heated in water before the corks can be drawn. The first boiling expands and expels most of the air from the bottle, coagulates the albuminous part of the fruit, and retards its fermenting tendencies. The second boiling, after the bottles have been corked and sealed, renders the free oxygen contained in the small quantity of enclosed air inert; the oxygen unites under the influence of heat with the organic matter, it is wholly converted into carbonic acid, and cannot act further in causing decomposition. To make the wax to seal the bottles, melt together one pound of resin, four ounces of beeswax, and three ounces of tallow."

Bottled Fruits Again.

"Mrs. H. C. L." writes: "I have heard many say strawberries could not be canned, 'they lost their flavor, cooked to pieces, lost their color,' &c. I have canned the Wilson for three years very successfully in the following manner. They kept their form very well, and nearly all their flavor. To 3 lbs. of carefully stemmed berries, put 1 lb. of sugar; lay them in a bright tin pan in alternate layers, let them remain 6 or 8 hours, then pour the juice off into a preserving kettle, and boil rapidly about 20 minutes. Put the berries in, and cook slowly 10 minutes, then bottle and seal them. For ripe currants, 3 lbs. of stemmed currants to 1 lb. of sugar; put them all together in the kettle and boil until the juice is pretty well out—say 10 minutes; then lift

the fruit out, and let the juice boil 15 or 20 minutes, then drop in the currants and let them remain only long enough to heat them through, and seal. After cooking currants in different ways, I find this the best, as the skin does not become tough, and they float in a thin, jelly-like juice that is delicious."

Sunday Morning Breakfast.

That brown loaf smoking from the oven, and those codfish balls nicely browned amid flakes of pig pork, are savory memories that most Yankee boys carry away with them from New England. Unless they marry Yankee girls they are apt to miss these Sunday morning institutions in their new homes. We have never found anything quite equal to them, and for the sake of the multitude of wanderers from the dear old homestead, we give some recipes from grandmother's cook book.

Brown Bread.—Scald 2 quarts of Indian meal, and when cool, add 1 quart of rye meal. Pour in warm water enough to make a thick batter. Then add a $\frac{1}{2}$ pint of molasses and a little salt, and one teaspoon of yeast. Butter an iron pan or kettle, pour in the batter, and let it stand until it rises enough to bake. Bake from six to eight hours, in a brick oven. Put it in at any time when it is ready, Saturday P. M., and let it stand until breakfast the next morning. There is a very wide difference of opinion as to which is the best kind of meal, white or yellow. Grandmother always used the yellow meal, and could not abide the white.

Codfish Balls.—Peel the potatoes the night before you wish to make the balls, and put them in clean water. Put the codfish also in water to soak. In the morning boil both, and after picking up the codfish very fine and mashing the potatoes, mix about two-thirds of potato with one-third of fish, and fry the balls with thin slices of nice pork just taken from the brine. The making of the balls from fresh cooked potatoes and fish adds very much to their excellence. When warmed up they are called codfish balls, but are quite another article.

Baked Beans.—Take a quart of Marrow-fat or White Kidney beans. After washing the beans, soak them 24 hours. Parboil them until quite tender; then put in a pan with a pound of fat pork and bake very slowly several hours, or all night.

Philadelphia County Yeast, by Mrs. S. Grate 12 large potatoes, and boil in three pints of water. Boil a handful of hops in two pints of water, and strain; then wash the hops with one pint of hot water, and strain. Then mix the boiled potatoes and hop water together, and stir in one good-sized teaspoonful of salt, and one of brown sugar, and let them cool. Then take of this mixture one pint, and add one pint yeast to it, and let it rise; then pour all together and keep moderately warm for rise. Keep it in a cool place for use. It will keep 3 or 4 weeks. Always keep some of this to make fresh yeast, but other yeast will do, if you have none of this.

Hop Yeast.—By Jane E. Duffie. Into 3 quarts of boiling water put 1 pint of hops tied up in a muslin bag. Add one tablespoonful of salt and boil $\frac{1}{4}$ hour. Then in another vessel, stir a pint of flour into a smooth paste with cold water. Take out the bag of hops and stir the paste into the hop water, which is still over the fire. Let it come to a boil, stirring all the while. When nearly cold, add a pint of cold water. After 24 hours it is ready for use. A $\frac{1}{2}$ teaspoonful of yeast is enough for a loaf of bread.

Tea Muffins.—(Mrs. M. C. contributes this and the following recipe.) 1 cup of milk, butter size of an egg, 1 tablespoonful of sugar, 2 eggs, 1 teaspoonful of cream of tartar stirred in the flour, $\frac{1}{2}$ teaspoonful of soda in a tablespoonful of hot water, and about 1 pint of flour, or enough to make a batter stiffer than usual for cake. Drop it into well-greased muffin pans or rings, and bake in a hot oven fifteen minutes. First mix the butter, sugar, and eggs together; then add the milk, then flour, and the soda last.

Battleboro Pudding.—1 cup of milk (or water), 1 cup of molasses, 1 teaspoonful of soda, 1 teaspoonful of salt, 1 lb. of raisins, four to make a stiff batter, $\frac{1}{2}$ cup mixed spices. Boil 4 hours. Leave sufficient room in the bag or mold to allow for swelling, as it will be of double the size when boiled, if allowed room to expand. By adding more fruit (such as currants and citron), it makes a most excellent plum pudding.

BOYS & GIRLS' COLUMNS.

A Stone's Talk.

I am older than you. My head is bald and smooth. It was not always so. Once, when I lived in the woods, thick, mossy carls clustered around my brow; but the trees were cut away, the sun shone hot upon me, the moss faded and turned gray, and at last the rain, and hail, and wind, pelted it all off. When your great-great-great grandfather Adam was alive, I was older than he. Old people have seen and heard more than young ones, and so I think I can teach you something, especially if you are a girl. Boys think they know enough without learning from a stone, or even from their father and mother sometimes. It takes them a long time to find out how much knowledge there is in the world, and how little of it is in their heads. When they do this, they begin to be wise. Girls are more wise; they do not think they know much, and so are willing to learn. This is not the case with all girls, neither are all boys "wise in their own conceit"; such children need not think this stone is thrown at them. When a stone is thrown up, why does it come down? Because that is the law. A wise man, Sir Isaac Newton, discovered this law, which he named the law of gravitation." All the stones in the world had obeyed this law for ages before the philosopher discovered it. No matter how high a stone is sent, even if it be shot from the mouth of a volcano thousands of feet into the air, back it will come to its place on the earth. Men have built tall columns and spires, and raised stones very high, but in a few hundred years most of them have found their way down to the ground: they always obey the laws made for them by their Creator. Do you?

Ways of Getting a Living—II.

TEST YOUR LUNGS, SIR?

Several years ago, when passing along Park Row, near our old office, we heard this question, and looked over the heads of the little crowd collected on the sidewalk, to see what it meant. The picture above shows about what was to be seen. A pleasant-faced, keen-eyed man had an apparatus to measure how much air a person could hold in his lungs. A highly polished brass vessel was inverted in another similar one containing water, and a rubber tube was placed so that a person could blow underneath the inner vessel. As the vessel was filled with air from the lungs, it rose slowly, and a pointer on the side of the outer vessel showed on a scale how many cubic inches of air had been blown into the inner vessel. It was amusing to watch the different persons who tried the apparatus. Our artist has sketched one young man who is a fair sample of a large number that "took a blow," as they called it. He seemed to have more face than brains, and more curiosity than good sense. He blew long and strongly, until his face reddened, and in his earnestness his knees bent under him. But, spite of his utmost efforts, he could not make the pointer reach as high a mark as a broad-shouldered countryman had just done. He would not have tried so hard, perhaps, if he had known a little more about his lungs, and that they would hold only a certain amount of air.

Be Courteous.

A friend of mine took his seat in a car for a journey by railroad. He noticed directly that the occupants of the seat before him were sailors, one a white man, a real "old salt," and the other black. As the seat they occupied was in a front corner of the car, and partly facing my friend, whom I will call the Doctor, he made some off-hand remark that led to conversation with them. He learned that they were just home from a long voyage, and also drew from them some interesting facts concerning it. They were much gratified with the civilities

shown them, which, in fact, amounted to nothing more than treating them as men. Soon the old sailor left his seat and drew out of his pack a beautiful cane of olive-wood. "There," said he, "I brought that from the Mediterranean, and I want you to take it, for it's not often that I find a man that knows how to treat an old salt." The Doctor objected, but at last took it and set it near him. Within a half hour afterward, the sailor was in convulsions. The black man watched over him with the utmost tenderness, saying that he had had such fits before and would come out of it. He did soon recover, and while in the sleep that followed his recovery, my friend's place of destination was reached. He thought of leaving the cane behind, but the black man protested. "I know him well," said he. "I've sailed with him for years. He meant what he said, and he'll feel hurt when he wakes if he finds you have not taken it." The Doctor brought it away. Its chief value to him arises from the fact that the gift was a sincere expression of gratitude for what was esteemed a favor, although I am sure it was but the natural outgoing of my friend's kindly heart; and he cannot but feel glad that he enjoyed and improved an opportunity of brightening another's pathway by a kind word. There are many lives that have little enough of joy in them, and a kind word costs but little. See how many such you can speak, young reader. Always and everywhere, "Be courteous."

UNCLE PAUL.

The Fourth of July.

The good, old-fashioned custom of celebrating Independence Day, we hope will never be given up. We can even bear to hear the impertinent snapping of fire-crackers and torpedoes, and the stunning report of artillery, rather than neglect to honor the day that gave birth to our Nation. If such noisy demonstrations are the best you can make, why make them. But we hope for the time when the explosion of powder will be deemed a hateful rather than a joyful sound. "There's a shout of murder in the cannon's boom." Did you every try to make a Fourth of July speech? A boys' and girls' celebration with a procession and meeting, and some young Webster or Clay for an orator, would be interesting, especially if the speaker would talk as he felt, and not merely try to make a grand speech with borrowed words.

Eight years ago a boy contributed a Fourth of July speech he wished to make. We think he must have been a pretty old boy. As more than one hundred thousand new subscribers to the *Agriculturist* received since that time have probably never seen it before, we reprint it here.

"Horrah for Liberty! Three cheers for independence! All Columbia forever! I have a small voice, but it is full of my heart, and it shall come to you like an electric spark falling on powder. Who is so dead that his pulse does not beat quicker on this birthday anniversary of the nation? If there be one, find him out, fill his pockets with powder and his hat with gas, tie him to a bundle of rockets, teach him off, and send him up to get a new view and an exalted idea of the glorious land he is now unworthy to inhabit. But I leave him to his fate and return to you who do exult as Americans should.

"When the seed breaks forth from its prison in the early year, the spring rejoices, and men are happy at heart; but the fullness of joy comes when the harvest waves over the field. The world rejoiced when, in 1776, our forefathers declared their independence. It was the young growth of Liberty. To-day we are reaping the fruits of that spring-time, and our joy overflows from swelling hearts. This country then was like a farm with here and there a field planted. There were scattered villages, full of life and promise, but few in number, and far between. What a crop has been raised from that small beginning! They had strong roots, those noble men, that fastened to the soil. They were God-fearing, liberty-loving men, and from those roots have sprung the blossoms and the fruit of the intelligence, the prosperity, and the happiness of our day. They had to fight hard, but they were brave because they were good, and fighting in a good cause, and what they won we enjoy.

"I hope the day of fighting with powder and ball has passed, in this country at least, and that we may always use our ammunition in fire crackers and rockets, and big guns, as we do to-day, without hurting any body; but I tell you, my young friends, the world's great battles are not over yet. We've worse enemies to overcome than our forefathers met on Bunker Hill, Saratoga, and Yorktown. Ignorance, selfishness, and vice, are working at the foundations of our prosperity like rats gnawing off the beams of the building that shelters them. Every one of us that grows up uneducated, or a wrong-doer, or selfish, or mean, is cherishing an enemy of his country. Oh! if I could to-day bring out the biggest gun ever made, load it to the muzzle with knowledge and goodness, discharge it into the heads and hearts of these troublemakers of the country, is there a boy that wouldn't give a light, or a girl that wouldn't, if necessary, give me her new dress for wadding? But it can't be done in that way. We must meet these enemies, book in hand, in the school-room; we must shame them out of the land by good examples

of truth-telling, of generosity and love; we must fight our battles hand to hand in our own lives, by resisting and overcoming every bad habit; and if each will overcome himself, then we will all have a good time together, and all be able to shout *liberty and independence forever!*"

Answers to Problems and Puzzles.

The following are the answers to the puzzles, etc., in the June number, page 222. No. 307. *Illustrated Rebus*.—*Always be grateful for the gifts you possess*. No. 308. *Illustrated Rebus*.—*I would not live always*. No. 309. *Aritmetical Problem*.—The man who owned the five leaves should receive all the money, and should also receive one-seventh of a dollar from the man who owned the two leaves. The following have sent in answers to puzzles, etc., published in previous numbers. A. F. Curtis, Charles P. Anderson, A. E. Smith, A. B. Leach, Adam Correll, Jr., "Crescent and Star," Sarah Dowland, James Ferguson, Lorin Morrison, J. M. Wheeler, C. A. Arnold, L. W. Wright, Howard Harris, F. Armstrong.

New Puzzles to be Answered.

No. 310. *Metagram*.—This word means a change in a letter. The puzzle is made by describing a word, then changing a letter in the word, and describing the new word, leaving the reader to find out what the words are, by the descriptions given. Thus: A word of four letters surrounds the earth and marks the course of the sun. It also sometimes embraces a lady. Change its first letter, and it will be found in an animal's back, also on a gentleman's coat; sometimes on the dinner table, and frequently in a dispute. Change the first letter again, and it gives a sound, but change the first letter once more, and it can give none. What are the words of this Metagram?

No. 311. *Illustrated Rebus*.—Quotation from a poem.

No. 312. *Mathematical Problem* for the younger pupils. Deposit one cent in a bank, and double the amount deposited for one year—as, one cent the first week, two cents the second week, four cents the third week, and so on for fifty-two weeks. How many farms of three hundred acres each, at seventy-five dollars per acre, could you buy with the money deposited through the year?

No. 313. *Picture Conundrum*.—Why is this unfortunate cat like some of our well-known authors?

[COPYRIGHT SECURED.]

"OUT TOO SOON."—FROM A PAINTING BY J. C. BEARD.—Drawn and Engraved for the American Agriculturist.

Mrs. Croak had three children, Pert, Dodger, and Bright. Their portraits are in the picture above. They lived in a nest which Mr. and Mrs. Croak had built near the top of a tall pine tree, in a lonely wood. Mr. Croak died shortly after his children were born. He lost his life while at a feast, where he eat so much that he could not travel very nimbly, and his enemy found and shot him. Mrs. Croak dressed in black, like a faithful widow, worked hard to rear the children alone, and tried to teach them all she knew, which was not a little. One day when she had flown away to pick up a nice dinner of grubs and corn for her darlings, Pert began to grow uneasy. "I'm tired of always staying here," said he; "let's get out and look around," and he began to hop over the backs of his brothers. "You'll break your neck," said Dodger, as Pert scrambled up on to the edge of the nest. But Pert gave a spring and fluttered his wings as he had seen his mother do, and got safely on to a branch above. "Oh! its splendid here!" he cried, as he looked out over the tops of the trees; but Dodger and Bright seeing he seemed safe, managed to clamber up beside him. Just then Mrs. Croak came swiftly flying home. She was so astonished at seeing them on their high and dangerous perch, that she let their dinner fall from her mouth, and at once gave them a lecture for their disobedience in leaving the nest when she was absent. Pert talked back saucily, and said he thought he was getting big enough to take care of himself. Dodger excused himself by blaming Pert, but Bright listened humbly and promised not to do so any more. I cannot say exactly how it happened, but one day not long after this a boy found a young crow at the foot of the tree, just able to *caw* feebly once or twice, and then it died—and this was the end of naughty Pert. No doubt he lost his life by not minding his mother.

Bright and Dodger must be alive, I think, for there are two very mischievous crows that steal much corn from the fields around the woods where they were born, and the boys say they have never been able to get a shot at either of them. They probably were careful to follow their mother's teachings, and grew to be as wise as she.

What is a Tear?

Mostly water. If some day when you have a "good crying spell" the tears be all saved, and put into the hands of a skillful chemist, he will be able to show you what else they contain. There will be a little of a slimy substance called mucus, a little salt, some soda, phosphate of soda (that is, phosphorus and oxygen united with soda), and phosphate of lime. These substances give the salt taste to tears. If a tear be allowed to fall upon a piece of glass, the water in it will evaporate, and leave the solid parts. When examined through a good microscope, these solid matters will be seen arranged in lines crossing each other, looking somewhat like small fish-bones. Tears are extracted from the materials which make up the blood, by a *gland*, which is situated above the eyeball and underneath the upper eyelid, on the side nearest the temple. Six or seven exceedingly small channels flow under the surface of the eyelid, discharging their contents a little above the delicate cartilage which supports the lid. It is these channels or canals that carry the tears into the eye. But tears do not flow only at certain moments and under certain circumstances, as is supposed; their flow is continuous; all day and all night, although less abundantly during sleep, they trickle softly from their slender sluices, and spread glistening over the surface of the pupil and the eyeball, giving them a bright

and limpid look which is one of the signs of health. It is the ceaseless movement and the contraction of the eyelids that effect the regular spreading of the tears, and the flow of these has need to be constantly renewed in the way just mentioned, because tears not only evaporate after a few seconds, but also are carried away through two little drains, called "lacrimal ducts," and situated in the corner of the eye near the nose. Strong emotions, especially of sorrow, sometimes cause the flow of tears to be more abundant than can be readily carried away by the ducts; then they overflow the lower eyelid and trickle down the cheek. When you have not very good cause for such abundant tears, it may help to dry them by thinking of the curious arrangement by which they are provided to keep the eye washed clean and in good order.

A Peculiar Taste.—At the dinner given by Professor Gamgee to test the quality of the meat preserved for months by his process, a gentleman was asked his opinion of the meat, after having eaten of it, cooked in various ways. "The mutton is most excellent," was the reply, "but I think," continued he, "that I could detect a peculiar taste in the fowls; the process probably affected the flesh a little." The reader will join in the smile which followed, when informed that the mutton alone had been prepared by Gamgee's process; the fowls had been brought fresh from the market, and had received no treatment, except the roasting, to change their flavor.

The best thing to give to your enemy is forgiveness; to your opponent, tolerance; to a friend, your heart; to your child, a good example; to a father, deference; to your mother, conduct that will make her proud of you; to yourself, respect; to all men, at all times, charity.

IMPORTANT NOTICE.

DEPARTMENT OF STATE,

WASHINGTON, May 9, 1893.

To WHEELER & WILSON, of New York:

SIRS: The Department has received ONE GOLD MEDAL, awarded to your firm, on Sewing and Button-Hole Machines, at the Paris Universal Exposition of 1887.

Your obedient servant,

WILLIAM H. SEWARD.

**FINE
WATCHES.**

We desire to call the attention of Watch buyers to the very fine Watches made by the AMERICAN WATCH CO., of Waltham, and known as the
3-4 PLATE, 16 SIZE.

To the manufacture of these Watches the Company have devoted all the science and skill in the art at their command, and confidently claim that for beauty and beauty, not less than for the greater excellencies of mechanical and scientific correctness of design and execution, these Watches will compare favorably with the best made in any country. In this country the manufacture of such Watches is not even attempted except at Waltham.

For sale by all respectable dealers.

ROBBINS & APPLETON, Agents,
No. 183 Broadway, New York.**C. O. D.****AMERICAN (WALTHAM) WATCHES.**

Now universally acknowledged the Best and Cheapest Watch in the World.

I will send to any address by Express a genuine WALTHAM WATCH, Chronometer Balance, Extra Jeweled, and in the Silver Case, for \$3.50, to be paid on delivery, accompanied with certificate of American Watch Company, guaranteeing it to be in all respects as represented. The buyer to have privilege of examination in the possession of Express Company. The purchaser is reminded that the price named is only a small advance on that asked for the bogus watch of unknown make, of no real value and dear at any price, and manufactured only for the purposes of fraud and deception, necessarily sold under fictitious names, and in such manner that the real swindler's name continues wholly unknown, and consequently redress becomes impossible. Name and address must be distinctly written. Buyer to pay Express Charge. Address
EUGENE BADGELEY, No. 137 Fulton-st., New York.

**WALTHAM WATCHES
For Farmers and Others.**

WE ARE SELLING THESE CELEBRATED Watches at a great reduction from former prices, and will send our descriptive price list to any address upon application. Silver Hunting Watches as low as \$18. Gold Hunting Watches at \$20. Address in full
HOWARD & CO., No. 69 Broadway, New York City.

COLGATE & CO'S**AROMATIC
VEGETABLE****SOAP,**

Is particularly adapted to the delicate Skin of Females and Infants.

Sold by all Dealers in Perfumery and Toilet Articles.

ONE OUNCE OF GOLD.

Will be given for every ounce of adulteration found in "E. T. Babbitt's Lix Colgate." This Colgate is roasted, ground, and sealed hermetically under letters patent from the "United States Government." All the "Aroma" is saved, and the Colgate presents a rich, glossy appearance. Every family should use it, as it is fifteen to twenty per cent stronger than other pure "Colgate." For sale everywhere. If your grocer does not keep this Colgate, and will not put it for you, send your orders direct to the factory.

E. T. BABBITT,

Nos. 64, 65, 66, 67, 68, 69, 70, 71 and 72 Washington-street, New York.

PRINCE & COS.

243 Broadway, New York.

A VALUABLE HOME LIBRARY.**BACK VOLUMES**

OF THE

AMERICAN AGRICULTURIST.

The publishers of the *American Agriculturist*, having preserved the electrotypes plates of the back volumes of that paper, from the Sixteenth to the Twenty-sixth Volume complete, can supply any or all of these as may be desired. These volumes contain more varied and interesting information on all matters pertaining to the Farm, Garden, and Household, than can be obtained in books costing three times as much money. They are profusely illustrated with the best of engravings, and in addition to the large amount of instructive reading matter for the older members of the Household, they contain a Special Department for the Boys and Girls. They, therefore, constitute in themselves a

**Most valuable Library for the
Farmer's Family or for any
other Home.**

The price of these volumes, unbound, is \$1.50 each, at the office, or \$1.75, if sent by mail, as they must be post-paid. The price of the same volumes, in neat cloth binding, with gilt title on the back, is \$2.00, at the office, or \$2.50, if sent by mail.

Address ORANGE JUDD & CO., Publishers, 245 Broadway, New York City.

Auction Sale of Fine Blooded Dairy Stock.

The third annual sale of thoroughbred and grade Alderney and Ayrshire Cows, Heifers, Cows and Bulls, will take place at the Farm of the subscriber, situated one mile from the Railroad Depot, in the City of New London, Connecticut, on Thursday, July 9th, 1885. Sale to commence at 11 o'clock, A. M. and no postponement on account of weather. 100 head of this celebrated stock will be sold as above, without reserve, to the highest bidder.

About 50 head are thoroughbred Alderneys.

" 25 " " " Ayrshires.

" 25 " " Cross of the two bloods (Alderney and Ayrshire).

Terms, Cash on delivery of the stock. Catalogues on the day of sale.

THOMAS FITCH, New London, Conn.

Fruits, Vegetables, Milk, Butter, &c.,

Effectually preserved without Sugar, without cooking them, and without air-tighting the jars or cans, by a new, cheap, brilliant, and effective method, that of the American Fruit Preserving Powder. These powders are the Spear's Solution, greatly improved by virtue of two new patents. Samples of Raspberries, Currants, &c., one year old, preserved by these powders, without cooking and without air-tighting, have been on exhibition at the office of the American Agriculturist since March 13th, 1885, have been frequently opened, and much exposed, and are now in perfect condition. Favor exceeding any preserved by cooking or air-tightening method, and retaining their full natural color, unchangeling. Circular sent free, or a Manual of 32 pages, containing full description and directions for preserving solid acids, sent for 10 cents.

These Preserving Powders are put up and sold for 50 cents per package, sent by mail for 75 cents—or we will send by mail, a small sample for trial—enough for a few pounds of fruit—for 15 cents. Also for sale by Druggists, Grocers, and General Dealers everywhere. If not found at your store, send direct to L. P. WHITLOCK, General Agent, No. 32 Chambers-st., New York.

The Premium Harvester of America.

Awarded the Highest Premiums at the most important Field Trials ever held in any Country.

20,000 Sold in a Single Season.

90,000 Now in Use.

Circulars forwarded by mail. Manufactured by ADINANCE, PLATT & CO., (Manufactury, Policeville.) 15 Greenleaf-st., New York. AULMAN, MILLER & CO., AERON, OHIO. A. P. RICHARDSON & CO., WORCESTER, MASS.

The American Hay Tedder.

THE BEST and only perfect machine ever invented for Turning or Tedding Hay. Hay cut, cured, and stored in the Barn in One Day!! THE QUALITY OF THE HAY CROP VERY MUCH INCREASED.

Very Great Race of Draft. It is very LIGHT, and so SIMPLE and DURABLE that it CANNOT GET OUT OF REPAIR. BURT'S SELF-ADJUSTING HORSE HAY RAKE, MORE SIMPLE, MORE DURABLE, and EASIER OF OPERATION than any other HORSE RAKE in the Market.

MADE ONLY BY AMES PLOW COMPANY, Quincy Hall, Boston, Mass., and 35 Deekman st., New York. Send for Illustrated Circular.

TURNP SEED FOR THE TRADE.

Our Wholesale Catalogue of Turnip and other seeds adapted to the present season, is now ready for mailing to DEALERS ONLY. J. M. THORNBURN & CO., 15 John-st., New York.

L. L. WHITLOCK'S Agricultural Recorder, 245 Broadway, New York. Specimen numbers 10c., \$1.50 per year. A. S. Fuller, Editor.

Vegetable Plants and Seeds

FOR Fall Crops.

Celery Plants (Incomparable Dwarf), \$1 per 100; \$1 per 500; \$5 per 1,000; \$25 per 2,000; \$40 per 10,000—larger quantities at special rates—of this variety from 30,000 to 40,000 is grown on an acre. Full instructions for cultivating accompanying each package.

Cabbage Plants, (Large Drumhead and Flat Dutch) 75c. per 100; \$3 per 500; \$5 per 1,000.

Cabbage Plants, (Red Dutch for Pickling) \$1 per 100; \$1 per 500; \$5 per 1,000.

Cauliflower Plants, (Paris and Erfurt) \$1 per 100; \$1 per 500; \$5 per 1,000.

By Express, carefully packed, so that they will reach the purchaser in perfect order, if the distance does not exceed three days in the transit.

Sent by Mail at 10c. per 100 additional.

TURNP SEED

BY MAIL.

DARWIN'S NEW WORK.

THE VARIATION

OF

ANIMALS AND PLANTS

UNDER DOMESTICATION.

BY

CHARLES DARWIN, M.A., F.R.S., &c.

WITH A PREFACE

TO THE

AMERICAN EDITION

BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY.

IN TWO VOLUMES.

This work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, results of in-and-in breeding, crossing, etc.

It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS; FOWLS, DUCKS, GEESSE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, BUD VARIATION. INHERITANCE, REVERSION OR ATAVISM, CROSSING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTER-BREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.

Published in two Volumes of nearly 1100 pages.

FINELY ILLUSTRATED.

SENT POST-PAID.....PRICE \$6.00.

ORANGE JUDD & CO.,

245 Broadway, New York City.

A few of the notices by the Press, of Darwin's Great Work, *The Variation of Animals and Plants under Domestication*, are here given:

Mr. Darwin is not an ordinary writer, and has not been content to expand his earlier and more general statements. His recital of curious facts is enlivened and illustrated throughout by thought; his principles and arguments everywhere rest solidly upon observed fact.

The reader is frequently led up in thought, within sight and hearing, as it were, of the very workshop of Nature. Glimpses are given of wonderful prospects, passing suggestions of thoughts almost too bold for expression, or profound analogies are embodied in illustrations which might be expanded into theories.

Every chapter is full of facts. They are the substance of the whole work. No room is lost by the theories. They serve as a system for arranging the facts, of which the book seems to contain more than could possibly be compressed into the same space, if it contained nothing else.

Messrs. Judd & Co. have done justice to the work, and credit to themselves, by the elegance and accuracy of this reprint. It is as pleasant to read as the English edition, and more convenient to handle than that, which costs twice as much. [New York Evening Post.

While eminently valuable as contributions to science, these volumes will be found a source of much interest and instruction to the mere lover of nature. For example, in the case of the domestic pigeon, Mr. Darwin has described fully all the chief races, their history, the amount and nature of their differences, and the probable steps by which they have been formed. We have also the fullest discussion and information regarding domestic dogs and cats, horses and asses, pigs, cattle, sheep and goats. [Scottish American Journal.

Messrs. Orange Judd & Co. have laid the public under obligation by their prompt and handsome reprint of Darwin's last work. Whether the reader agrees or not with the peculiar views of the author upon the great problems involved, there can be no two opinions of the value of these volumes as a storehouse of the results of observations concerning our domestic animals and plants, far more elaborate and complete than can elsewhere be found. We can testify also that the work is a fascinating one for perusal.—[Congregationalist & Recorder, (Boston).

The publishers have done a great service to science in reproducing this most recent work of Darwin's in a handsome and, for so elaborate a work, a cheap form.

He (Darwin) goes where his facts lead him, and of these he has an immense, but intelligibly arranged number; and has thus given to the breeder of animals, or the propagator of new varieties in the vegetable world, a treatise of great practical value, explaining all the laws of variation and selection that have thus far been definitely fixed. [Newark Advertiser.

It is a work which will command universal attention, and will be of particular value to agriculturists, whether engaged in stock-raising only, or in the cultivation of the soil in general.—[Forney's (Phila.) Weekly Press.

The book presents the most remarkable collection of facts, methodically arranged, concerning our domestic animals and plants, yet brought together, and for this alone, it is of the highest value.—[St. Louis Journal of Agriculture.

Whatever may be thought of Prof. Darwin's peculiar theories, there can be no doubt that his works form a large and important addition to human knowledge. In the present volumes his theory is connected with a vast variety of interesting and important facts, which have great practical value apart from the hypothesis they are brought forward to sustain.—[Boston Transcript.

The work is unlike adapted to the wants of the practical agriculturist, and the student of natural history. The immense collection of facts which it presents in illustration of the scientific views of the writer, are of singular interest and value, irrespective of the peculiar theory of which he is the most able and earnest advocate, and in its present form, the original expounder.

Mr. Darwin's modesty is no less remarkable than his candor. He is an example of the humility which belongs to genuine science, and is the condition of high intellectual attainments. The execution of his work is in harmony with the characteristics of his mind. Written in a style of eminent simplicity, artlessness, and sincerity, free from abstruse reasonings or pedantic refinements, it must prove singularly attractive to the lovers of nature no less than to the scientific student. [New York Tribune.

NEW AND BEAUTIFUL WORK.

THE BOOK OF EVERGREENS.

BY

JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation, Description of Varieties and their Adaptability to Different Situations.

NOTICES BY THE PRESS:

A very complete and every way admirable treatise on the Conifere, or cone-bearing plants, is *The Book of Evergreens*. Mr. Hoopes has devoted many years of labor and attention to the beautiful class of trees treated of, and his work, which is copiously illustrated, must at once become an authority. We shall be glad also, if it induces any to a closer study of trees, and to a further ornamentation of their houses with them. [Springfield Republican.

The value of this volume consists in its being both a labor of love and of duty. The author, having devoted a life to the study of trees and plants as a practical horticulturist, records here his views and experiences. Mr. Hoopes has studied all the treatises which bear on his subject, and availed himself of the assistance of many scientific friends, as well as recorded his own experience. The illustrations are numerous and excellent, and altogether the work has all the characteristics of an authority on the subject it so minutely and comprehensively treats.—[Boston Transcript.

It is a practical treatise on the Conifere, or cone-bearing plants, describing them in all their families, and their best culture, management, and so forth, and is well illustrated. It fills a vacant niche, and every intelligent culturist of trees should have and use it. [Congregationalist & Recorder, (Boston).

The work was evidently prepared with great care and pains, and embodies the results of years of close observation and study. It is one of great value to the agriculturist and landscape gardener, and of special interest to all who care to know anything of the flora of the globe. To those who wish to raise trees, it is an indispensable hand-book.—[Liberal Christian.

It is undoubtedly the most complete American work of the kind in print. It is well illustrated and handsomely printed.—[Boston Journal.

We have examined this handsome book with a great deal of pleasure and satisfaction. The author has pursued a very desirable plan in his work, giving sufficient scientific information to meet the wants of the botanical student, and yet the work is sufficiently elementary in explaining terms and points about plant structure, and systems of classification,—in short, plain enough to meet the wants of every reader. It is printed in neat style, with thick covers and beveled edges, and a large number of very superior illustrations.—[Journal of Agriculture.

The work is now ready. 435 pp., 13mo, on fine paper. SENT POST-PAID, PRICE \$3.90.

ORANGE JUDD & CO.,
245 Broadway, New York.

VALUABLE AND BEAUTIFUL WORK.

HARRIS' INSECTS INJURIOUS TO VEGETATION.

BY THE LATE

THADDEUS WILLIAM HARRIS, M. D.

Enlarged and improved, with additions from the author's manuscripts and original notes.

Illustrated by engravings drawn from nature under the supervision of

PROFESSOR AGASSIZ.

Edited by

CHARLES L. FLINT,

Secretary of the Massachusetts State Board of Agriculture.

CONTENTS.

CHAPTER I.

INTRODUCTION.—INSECTS DEFINED. BRAIN AND NERVES. AIR PIPES AND BREATHING HOLES. HEART AND BLOOD. METAMORPHOSES OR TRANSFORMATIONS. CLASSIFICATION; ORDERS AND GROUPS.

CHAPTER II.

COLEOPTERA.—BEETLES. SCARABAEANS. GROUND-BEETLES. TREE-BEETLES. COCKCHAPEERS. FLOWER, STAG, SPRING, TIMBER, CAPRICORN, LEAF-MINING, AND TORTOISE BEETLES. CHRYSOMELANS. CANTHARIDES.

CHAPTER III.

ORTHOPTERA.—EARWIGS. COCKROACHES. SOOTH-SAYERS. WALKING-STICKS OR SPECTRES. MOLE, FIELD, CLIMBING, AND WINGLESS CRICKETS. GRASSHOPPERS. KATYDID. LOCUSTS.

CHAPTER IV.

HEMIPTERA.—BUGS. SQUASH BUG. CLINCH-BUG. PLANT BUGS. HARVEST FLIES. TREE-HOPPERS. VINE HOPPERS. PLANT-LICE. AMERICAN BLIGHT. BARK-LICE.

CHAPTER V.

LEPIDOPTERA.—CATERPILLARS. BUTTERFLIES. SKIPPERS. HAWK-MOTHS. AGERIANS OR BORING CATERPILLARS. MOTHS. CUT-WORMS. SPAN-WORMS. LEAF-ROLLERS. FRUIT, BEE, CORN, CLOTHES, AND FEATHER-WINGED MOTHS.

CHAPTER VI.

HYMENOPTERA.—STINGERS AND PIERCERS. SAW-FLIES AND SLUGS. ELM, FIR, AND VINE SAW FLY. ROSE-BUSH AND PEAR-TREE SLUGS. HORN-TAILED WOOD WASPS. GALL FLIES. BARLEY INSECT AND JOINT WORM.

CHAPTER VII.

DIPTERA.—GNATS AND FLIES. MAGGOTS AND THEIR TRANSFORMATIONS. GALL-GNATS. HESIAN, WHEAT, AND RADISH FLIES. TWO-WINGED GALL-FLIES, AND FRUIT FLIES.

APPENDIX.—THE ARMY WORM.

Published in two beautiful editions; one plain, with steel engravings, 8vo, extra cloth, \$4.00; the other in extra cloth, beveled boards, red edges, engravings colored with great accuracy, \$6.00.

Sent post-paid on receipt of price.

ORANGE JUDD & CO.,

THE AMERICAN

HORTICULTURAL ANNUAL

For 1868.

A YEAR-BOOK

FOR EVERY HOME.

The second number of this serial is now ready. It contains a popular record of horticultural progress during the past year, besides valuable articles from

EMINENT HORTICULTURISTS.

Among those who contributed to its pages are

HON. MARSHALL P. WILDER,

PETER HENDERSON,

THOMAS MECHAN,

JOSIAH HOOPES,

WM. S. CARPENTER,

GEORGE W. CAMPBELL,

DOCTOR VAN KEUREN,

DOCTOR JOHN A. WARDER,

S. B. PARSONS,

JAS. J. H. GREGORY,

GEORGE SUCH,

ANDREW S. FULLER,

JOHN SAUL,

JAMES VICK, and

other well known pomological and floricultural writers.

The engravings, which have been prepared expressly for the work, are numerous, and make it the

MOST BEAUTIFULLY ILLUSTRATED

work of its kind ever published in this or any other country. It contains Tables, Lists of Nurserymen, Seedsmen, and Florists, and other useful matters of reference. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO.,
245 Broadway, New York.

COTTON CULTURE.

BY JOSEPH B. LYMAN.

WITH AN ADDITIONAL CHAPTER ON

COTTON SEED AND ITS USES.

BY J. R. SYMPER.

CONTENTS.

PART I.

THE COTTON FARM.—ITS STOCK, IMPLEMENTS, AND LABORERS.

PREPARATION OF SOIL AND PLANTING.

HOW THE CROP IS TO BE CULTIVATED.

COTTON PICKING.

GINNING, BALING, AND MARKETING.

THE COTTON PLANTER'S CALENDAR.

PART II.

QUALITY, EXTENT, AND CHARACTER OF COTTON LANDS OF NORTH AMERICA.

ENEMIES AND DISEASES OF COTTON.

IMPROVED AND SCIENTIFIC CULTURE.

VARIOUS KINDS OF COTTON CULTIVATED IN THE UNITED STATES.

HOW TO REALIZE THE MOST FROM A CROP. VALUE OF COTTON AS A PLANT, AND ITS USES. THE PAST AND THE FUTURE OF COTTON.

PRACTICAL SUGGESTIONS.

COTTON SEED OIL. COTTON SEED CAKE. SENT POST-PAID. PRICE \$1.75.

ORANGE JUDD & CO.,
245 Broadway, New York.

THE AMERICAN

AGRICULTURAL ANNUAL

For 1868.

A YEAR-BOOK

WANTED BY EVERYBODY.

This volume is now ready, and contains much of interest to every agriculturist. Besides the general record of agricultural progress, it has a valuable article on

Factory Dairy Practice,

By GARDNER B. WEEKS, Esq., Secretary of the American Dairymen's Association, in which he discusses the reasons for the best practice and the most approved apparatus, buildings, etc., fully illustrated, and is equally interesting to the practical dairymen and to the novice.

Sewers and Earth Closets

In their relations to Agriculture, by Col. Geo. E. Waring.

Winter Wheat,

Describing, with engravings, new and valuable varieties, by JOSEPH HARRIS and JOHN JOHNSTON;—one upon

Scythes and Cradles,

By JOHN W. DOUGLAS, (fully illustrated); also articles on **Horse Breaking** and on **Bitting Colts**, by SAM'L F. HEADLY, Esq., (illustrated); on **Recent Progress in Agricultural Science**, by Prof. S. W. JOHNSON; on Commercial Fertilizers, Veterinary Medicine and Jurisprudence, Progress of Invention Affecting Agriculture. Valuable Tables for Farmers and others, etc.

It is intended that the work shall be practical, excellent in the beauty of its illustrations, and in its adaptation to the wants of American Farmers, superior to anything of the kind heretofore published.

In its general features it is like the Agricultural Annual for 1867, containing an Almanac and Calendar, and there is added a list of dealers in Agricultural Implements, Seeds, etc. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO.,

245 Broadway, New York.

HINTS TO HORSEKEEPERS.

BY THE LATE HENRY WILLIAM HERBERT.

(FRANK FORESTER.)

BEAUTIFULLY ILLUSTRATED.

CONTENTS.

How to Breed a Horse.
Ponies—Different Breeds.
How to Breed Mules.
How to Buy a Horse.
How to Feed a Horse.
How to Groom a Horse.
How to Break a Horse.
How to Physic a Horse.
How to Shoe a Horse.
How to Ride a Horse, etc.

SENT POST-PAID. PRICE, \$1.75.

NEW BOOK OF FLOWERS.

By JOSEPH BRECK.

We have no work which is so safe a guide to the novice in gardening, or that imparts the necessary information in a style so free from technicalities. The following are some of the subjects treated:

Utility of Flowers.
Vitality of Seeds.
Planting.
Bedding.
Protection.
Bouquets.
Training.
Flower Gardens.
Lawns.
Flowering Shrubs.

SENT POST-PAID, PRICE, \$1.75.

ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, which have been described in a former number of the *American Agriculturist*, furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily.

CHURCHES,

DWELLINGS,

BARNs,

MILLS,

FENCES,

FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale. In offering them to parents for the instruction and amusement of their children, we feel that we are doing them a service which cannot be fully appreciated until they have seen the blocks in their wonderful combinations, affording a beautiful and lasting toy to the prattling infant, and serving as a delightful study and pastime for the older ones of the family.

The blocks are put up in neat boxes, each box containing a set, and a card giving various designs of buildings. Price per set: Plain, No. 1, \$1.00; No. 2, \$1.20; No. 3, \$1.00. Extra, Maple Finish, No. 1, \$2.00; No. 2, \$2.00; No. 3, \$1.50. A liberal discount will be made to dealers. Address

BY

Cummings & Miller.

Carpenters, Builders, and Stone Cutters;

Your attention is invited to a NEW and PRACTICAL WORK ON ARCHITECTURE, giving in detail on a working drawing scale, the exterior and interior of various classes of buildings—with 382 designs and 711 illustrations, containing street fronts, suburban houses, cottages, cottages, cottages, etc., etc. It is 11 by 11 inches in size, containing only practical work, designs and illustrations that separately would cost hundreds of dollars.

SENT POST-PAID. Price \$10.00.

ORANGE JUDD & CO.,
245 Broadway, New York.

Modern American Architecture.

BY CUMMINGS & MILLER.

AN ENTIRELY NEW WORK

containing

DESIGNS AND PLANS

For Villas, Farm-Houses, Cottages, City Residences, Churches, School-Houses, &c., &c. With Fifty-five original plates, giving in detail.

PLANS AND ILLUSTRATIONS

sited to all parts of the country. In sending for this work, it should be stated that Cummings & Miller's "Modern American Architecture" is wanted, instead of "Architecture," by the same authors, which is advertised above.

SENT POST-PAID. PRICE \$10.00.

ORANGE JUDD & CO.,
245 Broadway, New York.

Either of the books mentioned below will be sent, post-paid, on receipt of the price, by the Publishers, **ORANGE JUDD & CO.,** 245 Broadway, New York City.

Onions: How to Raise them Profitably.
Paper. 20

Being the Practical Details, from Selection of Soil and Preparation of Ground to Harvesting and Marketing the Crop, given very plainly by *Scraper's Practical Onion Growers* of long experience, residing in different parts of the country. No more valuable work of its size was ever issued. Octavo, 32 pp. Neat paper covers.

Our Farm of Four Acres, and the Money we Made by it 30

From the Twelfth London Edition, with an introduction for the American Edition. This work has already had an immense sale, both in England and in this country. It is written by a lady, and while conveying many useful suggestions, it has almost the interest of a romance. 12mo, 135 pp. New Edition. Price in neat paper covers, 30c.; bound, 60 cents.

Pardee on Strawberry Culture. 75

A Manual for the Cultivation of the Strawberry; with a Description of the Best Varieties. Also, Notes on the Raspberry, Blackberry, Currant, Gooseberry, and Grape. By R. G. PARDEE. Cloth, 12mo, 157 pp.

Randall's Sheep Husbandry. \$1.50

With an account of the different Breeds of Sheep; Selecting the Best for Wool and for Mutton; Rules for Crossing; Practical Details for Rearing; Summer and Winter Management; Treating Diseases; with New Chapters by Henry S. Randall and G. W. Kendall on Sheep Husbandry in Texas, with Portraits of different Breeds, Illustrations of Sheep Folds, and other Articles in Sheep Husbandry. Octavo, 358 pp.

A NEW WORK.

THE

PERCHERON HORSE.

TRANSLATED FROM THE FRENCH OF

CHARLES DU HUÏS,

Author of the "Dictionary of the Pure Race;" "Trotters;" "The Horse Breeder's Guide;" etc.

GOOD BOOKS FOR FARMERS AND OTHERS,

PUBLISHED BY

ORANGE JUDD & CO.,

245 Broadway, New York.

Either of the Books mentioned below will be sent, post-paid, on receipt of the price, by the Publishers.

Allen's Domestic Animals.....\$1.00

A History and Description of the HORSE, MULE, CATTLE, SHEEP, SWINE, POULTRY, and FARM DOGS, with directions for Breeding, Crossing, Rearing, Feeding, and Preparation for Market, with their DISEASES and REMEDIES. By R. L. ALLEN. Cloth, 12mo, 227 pp.

Allen's Rural Architecture.....\$1.50

Practical Directions and Suggestions for Construction of convenient FARM-HOUSES, COTTAGES, and OUT-BUILDINGS, including Barns, Stables, Sheds, Carriage and Wagon-Houses, Work-Shops, Wood-Houses, Ash and Smoke-Houses, Ice-Houses, Poultry and Bee-Houses, Dove-Cotes, etc., together with directions for the gardens and grounds; useful and ornamental Domestic Animals, etc. By Hon. LEWIS F. ALLEN, Editor "American Herd-Book," etc. Cloth, 12mo, 378 pp.

American Bird-Fancier.....Paper, .30.

Field, Cage, and House-Birds, breeding, rearing, etc. Paper, 12mo, 107 pp.

American Rose Culturist.....30

(Including the Dahlia.) Being a Practical Treatise on the Propagation, Cultivation, and Management of THE ROSE, to which are added full directions for the treatment of the Dahlia. In neat paper covers. 12mo, 96 pp.

American Farm-Book.(R. L. ALLEN).\$1.50

ON A COMPEND OF AMERICAN AGRICULTURE; Being a Practical Treatise on Soils, Manures, Draining, Irrigation, Grasses, Grain, Roots, Fruits, Cotton, Tobacco, Sugar-Cane, Rice, and every Staple Product of the United States; with the best methods of Planting, Cultivating, and Preparation for Market. Over one hundred engravings. By R. L. ALLEN. Cloth, 12mo, 325 pp.

American Weeds, and Useful Plants.\$1.75

An Important Work for every Cultivator—Farmer, Gardener, etc.; being an Enumeration and Description, (with accurate illustrations), of the WEEDS and PLANTS found in American Fields and Gardens, which meet the observation, or require the attention of Cultivators; with practical suggestions for their Eradication when needed. While *practical* in its character, it includes both the common and botanical names and characters of the Weeds and Plants, with a Popular Account of the Structure of Plants. By WM. DARLINGTON, M.D., and PROF. GEO. THURBER. Thoroughly Illustrated with 277 Engravings. 12mo., 460 pp.

Bement's Rabbit Fancier.....30

BREEDING, REARING, FEEDING, and GENERAL MANAGEMENT of Rabbits; their Diseases and Remedies; Full Directions for the Construction of Hutches, Rabbitries, etc.; Recipes for Cooking and Dressing for the Table. Numerous Illustrations. By C. M. BEMENT, author of *Poultry's Companion*, etc. 12mo, 104 pp., in neat illustrated paper covers.

Bommer's Method of Making Manures.

Paper,.....25
A method for the manufacture of a superior quality of manure; both from the vegetable and mineral substances, with strict economy and great dispatch; further showing the best mode of preparing vegetable and mineral composts, and a diversity of processes. By GEORGE BOMMER. 8vo, 90 pp.

Buist's Family Kitchen-Gardener.....\$1.00

An excellent Practical work, containing Plain and Accurate Descriptions of all the Different Species and Varieties of Culinary Vegetables, with their Botanical English, French, and German Names, alphabetically arranged; with full Directions for the Best Mode of Cultivating them in the Garden or under Glass. By ROBERT BUIST. Cloth, 12mo., 216 pp.

Boussingault's Rural Economy....\$1.60

Rural Economy in its relations with Chemistry, Physics, and Meteorology; or CHEMISTRY APPLIED TO AGRICULTURE in the Principles of Farm Management, the Preservation and Use of Manures, the Nutrition and Food of Animals, and the General Economy of Agriculture. By J. B. BOUSSINGAULT, Member of Institute of France, etc. Translated, with Introduction and Notes, by GEORGE LAW, Agriculturist. Cloth, 12mo, 507 pp.

Buist's American Flower Garden Directory.....\$1.50

Containing Practical Directions for the Culture of Plants in the Flower-Garden, Hot-House, Green-House, Rooms for Parlor-Windows, FOR EVERY MONTH IN THE YEAR; with descriptions of most desirable plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower-Garden, etc., etc. By ROBERT BUIST, a practical Nurseryman and Seed-Grower of Philadelphia. Cloth, 12mo, 342 pp.

Charlton's Grape-Grower's Guide....75

INTENDED ESPECIALLY FOR THE AMERICAN CLIMATE; being a practical Treatise, with Engravings, on the Cultivation of the Grape-Vine in each Department of Hot-House, Cold Grapery, etc.; with Plans for the Construction and Heating. By WM. CHARLTON. Cloth, 12mo, 301 pp.

Cobbett's American Gardener.....75

A Treatise on the Laying Out and Management of Gardens. Though an old work, it is one which will find a place in every considerable library, as the production of a remarkable man. While it is marked by the author's peculiarities, it is so full of plain common-sense, that it is worthy of being kept in print. By WILLIAM COBBETT. Cloth, 12mo., 230 pp.

Cole's American Fruit Book.....75

Containing Directions for Raising, Propagating, and Managing Fruit-Trees, Shrubs, and Plants, with descriptions of the best varieties of fruit, etc. 18mo, 288 pp.

Cole's American Veterinarian.....75

Diseases of Domestic Animals, showing the Causes, Symptoms, and Remedies, and rules for Restoring and Preserving Health by good management, with directions for Training and Breeding. By S. W. COLE. Cloth, 18mo., 288 pp.

Dadd's American Cattle-Doctor..\$1.50.

To Help Every Man to be his own Cattle-Doctor. A work by GEO. H. DADD, M.D., Veterinary Practitioner; giving the necessary information for preserving the Health and Curing the Diseases of OXEN, COWS, SHEEP, and SWINE, with a great variety of original Recipes, and valuable Information on Farm and Dairy Management. 12mo, 329 pp.

Dadd's Modern Horse Doctor.....\$1.50

CONTAINING PRACTICAL OBSERVATIONS ON THE CAUSES, NATURE, and TREATMENT of Diseases and Lameness of HORSES; embracing the most recent and improved Methods, according to an enlightened system of Veterinary Practice, for Preservation and Restoration of Health. Illustrated. By GEO. H. DADD, M.D., Veterinary Surgeon. Cloth, 12mo., 429 pp.

Dana's Muck Manual.....\$1.25

A Manual for Farmers; treating of Soils, Manures, Composts, etc., and especially of the important subject of using MUCK, the great natural fertilizer of the country. By SAMUEL L. DANA. Cloth, 12mo., 312 pp.

Eastwood's Complete Cranberry Manual 75

Giving directions for the cultivation in different localities, with illustrations and descriptions of varieties. By BENJ. EASTWOOD. Cloth, 12mo, 130 pp.

Elliott's Western Fruit Grower's Guide\$1.50

The previous Edition of this work was Thoroughly Revised; embracing all the new and valuable Fruits, with the latest improvements in their Cultivation; especially adapted to the wants of Western Fruit-Growers; full Illustrations. By F. R. ELLIOTT, of Ohio. Cloth, 12mo, 503 pp.

Field's Pear Culture.....\$1.25

THE PEAR GARDEN; a Treatise on the Propagation and Cultivation of the Pear Tree, with Instructions for Management from the Seedling to the Bearing Tree. By THOMAS W. FIELD. Illustrations. Cloth, 12mo, 296 pp.

Flax Culture.....50

A new and very valuable work, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper.

French's Farm Drainage.....1.50

The Principles, Process, and Effects of Draining Land with Stones, Wood, Drain-Plows, Open Ditches, and especially with Tiles; including Tables of Rainfall, Evaporation, Filtration, Excavation, Capacity of Pipes, cost and number to the acre. With over 100 illustrations. The best work on Draining published. By JUDGE FRENCH, of New Hampshire, President of Mass. Agricultural College. Cloth, 12mo, 354 pp.

Fuller's Illustrated Strawberry Culture.....Paper, .20

A new, practical little work, meeting with universal favor. It gives a full list of varieties, down to the latest valuable seedlings. Paper, 12mo, 48 pp.

Gregory on Squashes.....Paper, 30

This little Treatise, which no Farmer or Gardener ought to be without, tells all about selecting the soil for Squashes; how much manure is necessary; how to prepare and plant; about hoeing and cultivating; setting of the fruit; ripening, gathering, storing, care during winter, etc. By JAMES J. H. GREGORY. Paper covers, 12mo, 69 pp.

Guenon's Treatise on Milch Cows...75

An interesting work, giving new and peculiar directions, and many illustrative engravings, for determining by natural marks or external signs, the quality and quantity of milk a cow will give, length of time she will continue in milk, etc., with introductory remarks of forty pages on the Cow and Dairy. Sixty-third thousand. 8vo, 88 pp.

Hooper's Dog and Gun.....30

"A Few Loose Chapters on Shooting," with some Anecdotes and Incidents, Notes on Guns, Choosing and Training Dogs; about Game, etc. By J. J. HOOPER, Montgomery, Ala. Neat paper covers; 12mo, 105 pp.

Hop Culture.....40

PRACTICAL DETAILS fully given, from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRYING, PRESSING and MARKETING the Crop. Plain Directions by Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE THURBER, Editor of the *American Agriculturist*. 8vo., paper.

Johnston's Elements of Agricultural Chemistry.....\$1.50

An American edition of the English work. The writer, in addition to a complete treatise upon the Elements of Agricultural Chemistry, suggests modes of thought calculated to lead the reader constantly to reflection. Exact analyses are given of the various substances used as manure, thus giving aid to answer such inquiries. By JAS. F. W. JOHNSTON, M.A., F.R.S.S., L. and E., etc., etc. Cloth, 12mo, 381 pp.

Johnston's Agricultural Chemistry..1.75

LECTURES ON THE APPLICATION OF CHEMISTRY AND GEOLOGY TO AGRICULTURE. New edition, with an Appendix, containing the Author's Experiments in Practical Agriculture. By the late JAS. F. W. JOHNSTON, M.A., F.R.S.S., L. and E., etc., etc. This is an American edition of the large and extensive English work. Cloth, large 12mo, 700 pp.

Leachars' How to Build Hot-Houses.\$1.50

GREEN-HOUSES, GRAPERIES, etc. etc., and how to Ventilate them. Illustrated with numerous Engravings. This is the only work published in this country, specially devoted to this subject. By ROBERT B. LEACHARS, Garden Architect. Cloth, 12mo., 368 pp.

ROBEY TRUSS saves the most delicate, fragile and dangerous
trusts, breaks, moves or soils; always new. Sold
by all Druggists. Send for pamphlet, 1347

TROUT FISHING.—DRAWN BY E. FORBES.—Engraved for the American Agriculturist.

The artist here represents a scene to gladden any angler's heart, and it will doubtless recall to many of our readers wild gorges in Northern New England, or the Adirondacks, visited in their summer rambles. Trout fishing is among the most cheerful of sports, and numbers among its votaries a large class of men, who hardly indulge in other recreation in the whole circle of the year. They look forward with boyish delight to the summer vacation, when they can leave behind their cares and grow young again amid the wild scenes of nature. There is, per-

haps, no better recreation, for the trout is found chiefly in the swiftest brooks, and in rough, mountainous regions, where the scenery is most picturesque. Its favorite haunt is at the foot of a rapid or waterfall, where it watches for its prey. It matters little to the man of culture, whether he returns at evening with a full basket or not. He is something more than a sportsman, and has enjoyed what the basket cannot measure,—the pure air, the mountain scenery, the healthful exercise, and perfect freedom from professional cares. He gains what he seeks,—a

diversion from the routine of toil, and rest for body and mind, away from the haunts of men. The mind is best rested, when it is interested. It is really worth while to foster the passion for fishing, which most boys have, for the sake of the healthful recreation it will afford when they have left the farm and become men. While we would keep this passion under control, it should not be discouraged. We consider fishing rods, baskets, landing nets, snells, hooks, and rubber boots, good investments for our boys, and the time not lost, when we keep them company.

AMERICAN AGRICULTURIST.

NEW-YORK, AUGUST, 1868.

The meteorological character of this month varies greatly in different years, and the farmer's labors depend much upon the weather. In times of drouth, when pastures are low and when the brooks and watering places fail, the stock need constant attention and no little labor. Summer fodder crops will come in use, and are of great value, not only in maintaining a flow of milk, but in keeping dry stock in good condition. Summer fruits may be ready for marketing; spring grains will occupy the farmer's attention. Nevertheless, on the whole, August brings relief to the farmer; his labor is not so hard and usually he can make a few leisure days, if he will, to visit friends or take a trip with his wife to some mountain or sea-side resort, or one of inspection into some interesting agricultural section. It is very agreeable to blend business with pleasure when the business is the most important thing, and this is the only way some men can ever take any recreation,—that is, by making believe it is in the way of business. But it is a great deal better for health and true recreation to drop business, cast loose, and give one's self up to having a real good time, hunting, fishing, sight seeing, visiting, etc., if not in this month, then in September, or during the Fairs, if attending Fairs be not too much like business for most farmers.

Hints about Work.

Harvesting Spring Grains takes place according to the character of the early part of the season, and time of sowing, earlier or later by two or three weeks. It is best to cut wheat, oats, and barley, and especially the last two, while the grain is doughy and soft; the straw in the case of oats is much more valuable to feed, and the grain loses nothing. Barley needs especially rapid curing and protection against rain, for its price depends upon its bright, clean look, and its adhering chaff is very sensitive to moisture and will quickly take a mildew or rusty look. Cut oats when the field appears pretty well yellowed, but before it whitens too much. Always bind oats, if possible, for they take much less room in the barn or stack, and the straw cures and keeps brighter, and is probably better feed.

Buckwheat may be sown south of the latitude of New York up to the 10th of August with a reasonable hope that the frosts will hold off long enough to enable seed to form. Still, the longer sowing is deferred, the more hazardous it is.

Turnips may also be sown early in the month. It is too late to get a crop from any but the common white, although on good soil Rutabagas, or French turnips will produce a crop of nice, little table roots as large as a man's fist or larger, which are excellent for winter use, and when selected of uniform size, sell well. Fill spaces existing in rows of all root crops, and all spots not otherwise occupied, with turnips, either by sowing the seed or transplanting. Tuck in the seed freely.

Root crops generally will need hoeing and thinning. As a rule, don't spare thrifty plants if crowded, but thin them thoroughly, so that when mature the leaves will barely touch. Where spaces are very wide from any cause, two roots may be left nearer than would otherwise be admissible, but it is a poor plan to let them crowd one another. Carrots make their principal growth after the first of August, and need thorough weeding and thinning at this time. If the ground be stirred frequently, they will be much benefited, and it is long before the tops interfere with cultivation or make so dense a shade as not to suffer weeds to grow.

Head crops, other than roots, which include corn, potatoes, sorghum, broom-corn, etc., are or should be beyond tillage with plows, hoes or cultivators. Weeds, however, should be thoroughly pulled, and the ground kept clean, or one great advantage of these crops, namely, ridding the land of weeds, will be in a great measure, if not entirely, lost.

Weeds are plants growing out of place, it is said—and if this is true, an oak tree may be as much a weed as a mullein in a clover field. If we have hot, dry weather, make use of it to cut up weeds, to mow brush, to clear up fence rows, and to clear up bush pastures and such land. All herbaceous plants that have not matured their seed are peculiarly sensitive at this season, and shrubs and trees hardly less so though their roots go deeper. Should these sprout again from the stumps, sheep will browse the shoots, or they may be trodden upon and rubbed off with ease if not too numerous.

Pastures.—Harrow lightly, sow and bush in White clover, Blue grass, and Red top seed, on upland pastures at this season, accompanied by a dressing of plaster and ashes, and if the pasture be an old one, put on two to twenty barrels of bone-dust. An old pasture treated thus will be rejuvenated, if not fed off too close the rest of the season.

Swamps and Dregs.—If the season be favorable for ditching in low grounds, lay out the drains and have the men at work every spare half day; get out as much muck and peat as possible as you progress, throwing it out on one side only of the ditch. Even if the weather be wet the ditch will most likely dry the ground in the immediate vicinity, so that the muck can be hauled out as soon as dry. The drying of peaty land may be sometimes facilitated by thrusting smooth poles obliquely into the peaty mass on either side as far as possible, and at a level not much above the bottom of the ditch. Roots, brush, and tussocks of grass or brakes, may be laid up in piles to dry for burning by and by. The ashes will be an excellent dressing for the soil.

Ditching of uplands may proceed at this season if there is opportunity, and it often enables farmers to provide profitable work for their hands during a lull in the pressure of regular farm work.

Grass seed may often be saved in sufficient quantity for one's own use, by observing where any variety grows unmixed and allowing such to become ripe, cutting with a sickle, binding in bundles to be thrashed or rubbed out at leisure. Seeds of many of our best pasture and meadow grasses can only be bought at very high prices, while a little care taken in gathering them would afford an abundant supply for home use, if not for sale.

Manure.—Compost heaps rapidly ferment and become homogeneous in character in hot weather. All sorts of vegetation in its green state is adapted to be used in this way. Swamp grass and brakes, sods, potato tops, and similar substances, are valuable ingredients. Lay them in alternate layers with animal manure, or putting them in thin layers, sprinkle each thoroughly with lime, or ashes. If liquid manure can be pumped over the heaps the advantage will be marked. Muck and peat should be got out and laid up to dry before carting.

Mowing Grass lands at this season or as soon as sown is productive of more good, both to the succeeding crop and to the land, than at any other season. The clover and grass roots are vigorous and strike deep at the time the hay is cut off. A little encouragement at this time keeps them active, the sod will be close, the aftermath strong, and the grass crop next year much improved. Even a dressing of common loam from an adjoining field will often make the difference of half a ton of hay to the acre on grass land beginning to fail, if it be applied in July or August.

Working Stock.—If the working cattle have been properly handled during the early summer, they will be capable of doing much hard labor in August, without sensibly feeding it. It is best, however, to do the severest work in the early morning, heavy plowing or hauling stones, for instance.

Cows should have occasional change of pasture, not only for the good of the grass, but on their own account. If the pastures are short, give a liberal feed of green corn fodder regularly, once, twice, or three times during the day. It is best if wilted.

Calves and Colts.—It is usually best to wean calves and colts in August, that is, at four or five months old, if they have been suffered to run with

their dams. This must be done gradually, or there will be a marked falling off in flesh. Make up by feeding a pint or two of oil-meal, beginning gradually with it on ent feed, and as gradually withholding it if you do not desire to continue the feed.

Sheep.—Wean lambs this month or next, in time at least to allow the ewes to get in good condition for wintering. Have a care that the ewes do not suffer from caked bag when the lambs are removed, and examine and milk them if need be for a few days.

Swine.—Where manure is an object it is hardly worth while to begin seriously to fatten hogs before corn is nearly ripe. They may be employed in working over all sorts of manurial substances to excellent advantage. Feed them well; they will work the better and be in good condition to fatten.

Work in the Horticultural Departments.

In these sweltering days of July, at a time when the rush of vegetation after a late spring tempts one to outdoor rather than indoor work, our notes will be rather brief. Two things will claim especial attention of the horticulturist,—packing and forwarding his products to market, and insects. Look over what has been said in previous months.

Orchard and Nursery.

The harvest is already going on with our Southern neighbors, who should recollect that the more distant the market, the more care is required in shipping the fruit. Let them recollect that the fruit in large cities is sold almost entirely by its looks. An important point, which we have often insisted upon, is

Assorting, and to add force to our remarks on this subject we quote from the Proceedings of the Am. Pomological Society, where Dr. Chaggett, a large fruit dealer of St. Louis, said: "I wish I could impress upon fruit growers the importance and profit of assorting their fruit. Fruit will not only bring better prices if assorted, but depreciation of prices will be prevented. Too few shippers assort their fruit. Such as do so, get from one-third to one-half more than those who do not do so. Full one-third of the fruit found in packages had better have been given to the pigs * * * If one-third of the fruit sent to market were left at home, the other two-thirds would bring more than the whole does now."

Thinning is a way of assorting on the tree, and we have often advocated this. What is the use of allowing fruit that can never be good for home use, or market, to exhaust the energies of the tree?

Packing does not receive sufficient attention. Fruit should be subjected to sufficient pressure to prevent bruising in transportation. One who sees how fruit packages are handled by the railroad and steamboat hands will not need to be told of this.

Picking should always be done by hand. For this purpose various kinds of ladders should be in readiness to reach all the fruit. In previous volumes we have figured several forms of ladders suited to the orchard. A common ladder may be so stayed with ropes as to answer in the absence of better.

Insects are still to be fought vigorously. Pick up fallen fruit every day and give to the pigs. Later in the season the apples may be used to make vinegar. Red-spider is not now rare on pear trees, and must be fought with soap-suds, whale-oil, or creosote—and water. This insect only revels in hot and dry weather. Plant-lice are to be treated to the same preparations or to tobacco water. Late broods of Tent and other caterpillars are to be exterminated.

Budding is in order with all stocks upon which the bark will run and where well-developed buds can be obtained. If buds are slow in maturing, pinch off the ends of the twigs intended to be used to supply them. The cherry and plum are the earliest budded; then follow the pear, apple, cherry on mahaleb, peach, and quince. If the tyings on stocks budded earlier are too tight, loosen them.

Weeds.—Keep clear of them. If the ground is not occupied by some crop that will benefit the trees, allow nothing to grow, but keep the soil nice and mellow by frequent use of the cultivator.

Fire-blight has been much discussed as to its cause, but the only treatment yet known is to cut away the diseased parts as soon as discovered.

Black-Knot is to be treated in the same way.

Fruit Garden.

The general treatment of trees in the fruit garden is hinted at under *Orchard*. Market or preserve all fruit not consumed by the family. Some good hints on bottling and otherwise preserving fruit are given in the *Household Department* this month.

Strawberries will have made good runners. Spring and autumn planting each have their advocates. Autumn planting succeeds well in all except northern localities. We saw a fine plantation this spring that was made the last week in November from plants started in pots as noted on page 297. This plan is gaining favor among cultivators and nurserymen; the principal outlay is for small pots in time to strike the runners. One has only to turn the plants out of the pot and is thus almost independent of the season. This plan is of easy execution, and commended to small cultivators.

Strawberries for forcing should be started in small pots, and when well established are to be later in the season transferred to the larger pots in which they are to fruit. Triomphe de Gand and Trollope's Victoria are among the best sorts for forcing.

Blackberries are to be kept within bounds and made to throw out more bearing shoots by pinching as heretofore directed.

Raspberries.—The best cultivators take out the old canes as soon as the fruit is off, though many leave the pruning until the time for laying down or even until spring. Keep the ground clean by means of the cultivator and hoe, and remove all suckers not needed for canes or for making new plants.

Experiments.—Be it known that all of our cultivated Blackberries, and many of our Raspberries, have been found as wild plants and transferred to the garden. Those who wish to experiment with these, or with the almost uncultivated huckleberry, should mark the wild specimens of which the fruit is of fine quality and transfer them to the garden in autumn. A bit of white rag tied to the stem is not observable while the leaves are on, but readily seen at a distance when the stem is naked.

Grapes.—The general treatment of the vine has been sufficiently given in our series of articles on the subject. One should be among his vines daily, and give them such tying, pinching, and other treatment, as they need. Do not pass by a caterpillar or other injurious insect without destroying it. We have long advocated hand-picking as the surest way of disposing of many insects. The Gardener's Monthly sensibly says: "We have seen instances where people have spent an hour in arranging matters to destroy or drive away insects, by some charmed process, when a half an hour of hand-picking would have destroyed the whole crop."

Dwarf Trees will need to have their fruit thinned, if not already done. Early fruit is to be picked as soon as well developed, and ripened indoors.

Weeds are to be kept entirely out of the fruit garden. Let the soil be clean and mellow wherever there is no mulch. Some hand-pulling of weeds will be needed among the strawberry and other plants.

Mulch and Water are the two helps for newly planted trees which suffer from drouth. Either cover the ground all around the tree with a thick coat of litter, or draw away the earth, give the roots a good soaking, and replace the earth.

Kitchen Garden.

The garden should now be quite clear of weeds and many of the crops have so taken possession of the soil that the labor is very much reduced.

Asparagus.—Keep seedling plants free from weeds, and thin them to get strong, well-developed roots.

Beans of the bush kinds may still be put in to furnish a late crop for stringing or to salt for winter.

Cabbages.—Plants may still be set in the Southern States. If slugs appear, dust lime over the ground.

Carrots and all other root crops are to be thinned if needed, and the soil kept loose between the rows as long as convenient to work them.

Celery may be set out early this month, and make a late crop. Keep the plantings well cultivated.

Corn.—Save the earliest and finest ears for seed.

Cucumbers come on rapidly and the vines should be picked over every day or two for pickles.

Egg Plants.—Forward them by the use of liquid manure, and mulch to keep the soil moist, and prevent the fruit from resting on the ground. Look out for caterpillars, which are very fond of the plants.

Endive.—Transplant a foot apart each way. When the plants are a foot in diameter blanch for use by gathering up the outside leaves and tying them by their tips over the center of the plant, or by laying a board over them. Darkness is what is required. The tying or covering should be done when the plants are dry. Sow seed for a late crop.

Melons.—Removing a portion of the later set fruit will improve the quality of that remaining. Save seed from fine and early specimens which have grown at a good distance from other varieties.

Onions are to be pulled as soon as the tops of a majority of the plants fall over. Dry thoroughly those that are to be stored for winter. They should not be put in large heaps, but spread thinly in a cool and dry place. Take up onion sets and store in a similar place, spread in layers about 4 inches thick.

Radishes.—The early sorts may be sown in vacant places. Winter varieties are to be treated like turnips. Those who are fond of radishes should try the Chinese Rose-colored Winter—the best.

Spinach may be sown for fall cutting; the crop to winter over should be deferred until next month.

Squashes.—Look for insects' eggs on the under sides of the leaves, and crush them. Several ways of destroying insects are given in this and previous numbers. Hand-picking is a great help. If the runners root at the joints, do not disturb them.

Sweet Potatoes.—Keep the soil clean and mellow. At the North the vines should not be allowed to take root at the joints; move them occasionally.

Tomatoes.—If training of any kind is done, keep the vines tied up and in good order. If any worm "droppings" are seen upon the leaves or on the ground, search for the worm. It is the large green worm that infests potatoes and tobacco, and will not only eat leaves and stems but green fruit. Catch and crush. Save seed only from the earliest and best formed, if it is desired to keep the variety in its purity. It often happens that a vine will be more prolific or bear a better fruit than the rest,—indeed be as distinct as many of the "new varieties." Save seed of such specimens for trial.

Turnips.—Sow Ruta-bagas early in the month, and the flat kinds later. Give a dusting of lime as soon as the plants are up, to keep off insects.

Water only when plants are absolutely suffering; with thorough working there is seldom need of it. If liquid manure is used, do not apply it during a time of drouth, but only in a growing time.

Flower Garden and Lawn.

The condition in which the grounds are kept in the month of August is a good indication of the gardener's industry. Some enthusiasts work well while they are rewarded by an abundance of spring flowers, but their zeal abates under the August heat. In this interregnum between the early and late blooming flowers the few that show themselves should be made to look at their best, and neatness and care make up for the lack of floral display.

Beds in the lawn ought always to present a well-defined margin, and no grass or clover should be allowed to run into them. These beds are generally planted in masses and should be kept well weeded, and the soil loose until the plants have covered it. When "foliage plants" are employed they produce a much better effect if trimmed occasionally, so as to keep the center of the mass the highest.

Lawns, to be velvet, need mowing every week. The hand and horse machines now in use allow this

this month, and prices about $\frac{1}{4}$ c. lower. Sales, however, have been steady, and the supply has all been taken up. Nothing is selling above 9 cts. per pound, and really good hogs may be had for 8 $\frac{1}{2}$ cts. Prices range from 80 to 8 $\frac{1}{2}$ cts. per pound. But few dressed hogs are in market, and sell for 12 to 12 $\frac{1}{2}$ cts. per pound. The market days in and about N. Y. City are: Communiwup and Hudson City, N. J., on Mondays and Thursdays; at the National Drove Yard, 100th St., on Wednesdays; Hog and Sheep Market, 40th St. and 11th Avenue, Wednesdays and Saturdays.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, so thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the *Registry fee*, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters sent in this way to us are at our risk.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be pre-paid at the Post-office where the paper is received.

The Weather and the Crops.—The wet season at the East happily let up towards the last of June and farmers profited by several days of intensely hot weather early in July. Haying was commenced under favorable auspices and though storms and summer rains followed, we have strong hopes that the season will not be a wet one. The backward corn crop is beginning to pick up on dry land, but a large portion of it may never glaze properly. It is a saying as true as old, however, that July and August make the corn crop. Winter grains, where not winter-killed, are at the time we write filling well and will come up to the full average. Spring grains, oats particularly, though backward, promise fairly. From what we see and hear we think an unusually large breadth of oats has been sown. The fact that a short corn crop may be reasonably anticipated at the East, and will surely come in case frosts do not hold off longer than usual, should lead farmers to put in as many turnips as they can as a substitute. The reports from the great corn growing sections are decidedly favorable, and farmers expecting a very large crop are already buying heaves in anticipation. Spring wheat does not look well as a rule; winter grain is more promising as it approaches the harvest. High winds, hail storms, and violent rains with sudden changes of temperature, have been quite prevalent in many sections, and there is considerable complaint of badly lodged grass and grain. From Kentucky there come complaints of the insects damaging the wheat. The Potato bug continues its depredations west of the Mississippi and at certain spots abroad, in which direction it is steadily migrating. Grasshoppers are doing their share of damage also, but so far, apparently not so much as last year.

Unanswered Letters.—Some of the publishers and editors set off for their summer vacation, leaving in reduced office force. This will account for the delay in answering those correspondents whose letters fall into the departments of the absentees.

Sundry Humbugs.—Several correspondents inform us that Hallet, Moore & Co., are still operating on the five per cent plan. The unclaimed prizes of J. R. Hawley & Co.'s prize lottery are for sale by them, at five per cent on the valuation. J. R. Hawley in a reply to a letter says that H. M. & Co., have no authority to act for him, and he knows nothing about them. We say

don't trust either of them with any money.... We have a list of names of firms, not to be found at the numbers given. Among the more prominent ones are: Harper, Wilson & Co., or the "Metropolitan Gift Co.," offering pianos, melodeons, jewelry, etc., are not to be found at the numbers named. The new feature presented by them is a long list of names of persons, who, they say, have drawn prizes. Perhaps by addressing some of these, a reply may be had, but we doubt it. The fact that they are not to be found at the number is enough for us to pronounce them unsafe. Sanford, Frazer & Co., belong to the Kelley tribe of "Kelley's Weekly." They want \$3 to tell what the prize is in the drawing of Kelley & Co., and aid in getting it. They do not appear at the address given. Cambridge & Co. send out villainous and absurd reading in the shape of pamphlets, and we don't wonder that they are not to be found. Do not confound J. T. Stewart, jewelry and watch lottery, with A. T. Stewart, the merchant. We called at the number of the former, and of course could not find him. Look out for the so-called "Improved French Allotite Watch," Brainard, Le Seur & Co., 44 Broad-st. Their circulars are very presentable and modest, and well calculated to deceive the unwary. We warn all against them, no matter how plausible their advertisements. They, too, are not discoverable at the number given, which is a suspicious circumstance. Vincent, Branch & Co., watches, jewelry, etc., are not to be found at the address named in their circular. Persons of course will be careful not to send money to them for any purpose whatever.... J. Lyon, 174 Hudson-st., is evidently "on the make." What did he pay Westbrook & Co., for all right, title, plates, and the "good will" of the business? At whatever price he got them, he was pretty effectually "sold," for they are well known to be worthless things by a very large class of our readers.... We wish the proprietor of that Drug Store on the Bowery, who has been in the habit of getting "Madams Beach and Putney's" letters, would ask the Madams to send us their book of "Private Instructions." Perhaps we would give both him and them a notice.... Reed & Co. have a new dodge. They propose to those who have drawn prizes and are dissatisfied with their luck, to pay them the full value in money, less 12 per cent. We "can't see it," Mr. Reed. Try again.... D. McDowell, 907 Broadway, is on the Soldiers' and Sailors' Orphan Enterprise. This is also on the per cent plan. He claims to be Secretary for the committee, etc. The prizes run about \$300 each, 5 per cent is \$10, and that is what he is after. This is just now a very popular way of swindling. We have letters of at least six different firms now in operation in this city, all pretending to aid soldiers or sailors, but each taking precious good care that such worthy charities never get one dollar of the thousands they have induced the people to entrust them with. We warn our readers against any and all of them. Don't confound the above D. McDowell and his enterprise with the "National Home for Destitute Widows and Orphans of Soldiers and Sailors, No. 691 Broadway," which has the confidence of honorable people, and is a worthy charity.

The Pennsylvania Ag'l College.—We gave due notice of the reorganization of this college and hoped that it would, from being a disgrace, become a first class institution. A letter received from an officer of the college a few weeks ago informed us that affairs there were "all in a middle" and now we learn from the daily papers that there has been a general resignation of President and Faculty. What is the matter with this college? Perhaps setting it down in the back woods away from the lines of travel has something to do with its want of success, and probably its failure is not unassociated with incompetence in the management. It looks very much like a case for legislative investigation.

The Illinois State Fair takes place this year at Quincy, Sept. 21st to 26th. Upwards of \$10,000 are offered in premiums, of which \$9,000 are in money. John P. Reynolds, of Springfield, is the Secretary.

Hedge Convention.—Hedges are an institution in the West, the importance of which may be judged by the formation of a Hedge Plant Growers' Convention. Judging from the report, its object is mainly to agree upon the manner of conducting the business of raising hedge plants and selling them. The Secretary and Treasurer is H. N. Poarse, Bloomington, Ill.

Grape Exhibitions.—The importance of grape culture in this country is shown by the existence of several associations composed entirely of grape growers and the announcement of exhibitions devoted to the grape alone. We give the dates of these exhibitions as far as received, and shall probably hear of others. The N. Y. State Grape Growers Association will hold its annual Fair at Cannadagwa, Oct. 7th and 8th. G. F. Wilcox, Fairport, is Secretary. The Pleasant Valley Grape Growers Association's annual Fair will be at Hammonds-

port on Sept. 23d, 24th and 25th, and at the same place on Oct. 28th there will be held a critical trial of grapes to test their wine producing qualities. The liberal premiums offered by the Longworth Wine House for the best wine grape for general cultivation will be competed for at the exhibition of the Cincinnati Hort. Soc., Sept. 23d.

The "Orange Judd Wheat Prizes."
\$100 for the best two barrels of white Winter Wheat.
\$100 for the best two barrels of red Winter Wheat.
\$100 for the best two barrels of Spring Wheat.
Attention is called to the fact, that Mr. Orange Judd offers \$300.00 through the N. Y. State Agricultural Society, distributed in three prizes as above shown, for samples of wheat. Open to the U. S. and Canada. See p. 57, March No.

The Wheat Crop.—As we go to press the reports coming in are more and more assuring in regard to the prospect of a wonderful yield of wheat. Much, of course, depends upon the harvest, but an unusual breadth has been sown. It has, on the whole, looked well and done well all the time except over limited areas of prevalently wet land, which has not been underdrained, and where the grain has been exposed to winter-killing. The harvest, so far as it has progressed, has been successful, and the new wheat in market is good. Spring wheat is improving and earing finely, both East and West.

Peat Analysis.—Two samples of peat from C. P. Williams farm, at Charlestown, R. I., have been analyzed at the Harvard Scientific School with the following results.

	Sample No. 1.	No. 2.
Moisture.....	26.00	26.05
Organic Matter.....	48.00	46.07
Ammonia.....	3.12	3.15
Chloride of Sodium.....	.16	.24
Lime.....	1.48	1.56
Silica, Alumina, Magnesia, Iron, & Loss	20.24	21.85
	100.00	100.00

The analysis shows about six times the amount of ammonia found in common yard manure, and only needs the addition of wood-ashes and bone-dust to make it an exceedingly valuable fertilizer. It is strange that farmers will let such mines of wealth lie unused upon their farms. Mr. W. uses about a thousand loads a year, and is bringing up a run-down farm to a high state of fertility.

The Kentucky State Fair is to be held at Louisville, Sept. 15th to 19th.

The New Hampshire State Fair takes place this year at Manchester, Sept. 15th to 17th.

Turnips Among Corn.—Between the first and tenth of August, turnips may be sowed broadcast among Indian corn. Even if not covered, many seeds will grow; but it is much better to go through the piece rapidly with potato hooks or pronged hoes, breaking the surface uniformly, and pulling all large weeds at the same time. The corn should be cut up at the ground and stacked as soon as glazed, and the turnips will then have two months' occupation of the soil. This will do much towards helping out a short corn crop.

Your Patent.—"S. D. J., Ohio, sends us specimens of a bent-up wire for supporting plants, says he is negotiating for a patent, and asks our opinion. We think that for many things the contrivance will work well. But why patent it? It is strange that men who are freely using all of the contrivances of those who have preceded them, are unwilling to add to the common stock of knowledge, but the moment they hit upon a simple expedient must go and patent it. If a thing has cost time and inventive thought, we think it should be patented, but when one has something as simple as a bow knot, a mere twist in a wire, we think it folly to patent it. If one has a wire and chooses to twist it up in the way our friend has done, we don't think there are twelve men in the country who, on a jury, would award him damages. This patent business has been, to use a vulgarism, "run into the ground," and unless something like sense can prevail at the patent office, the people will insist upon its abolishment. Persons claiming to hold patents for the simplest contrivances given in the journals are constantly annoying farmers with threats of prosecution. Have a Farmers' Club in every neighborhood; tell these fellows to prosecute, and make a common cause for the defence. Very few suits will ever come to trial when it is found that the game of "bluff" will not work.

Wild Morning Glory.—Our friends write about a troublesome plant under this name, but as they do not send specimens, we do not know which of three plants, which may well bear the name, they mean. One, the Wild Potato Vine, or Man of the Earth, (*Ipomoea*

pandurata), has an enormous root, weighing from 10 to 12 lbs., and is capable of standing a long siege. The Hedge Bindweed, *Calyptegia sepium*, is much like the common Morning Glory in its flower, but is a perennial; it is very common in low grounds. The Bindweed of Europe, (*Convolvulus arvensis*), is an introduced and small-flowered plant, but one of the most obstinate of weeds. W. H. Parkin, Henry Co., Ill., gives us his method of dealing with the Wild Morning Glory, which would probably apply to the first two sorts mentioned: "The more the ground is stirred, where they are, the more they will spread, and as for choking them it cannot be done here. But they can be got rid of very easily: stock the ground to clover, and turn on cattle or hogs. Cattle and hogs will eat the vines in preference to anything else. Hogs, particularly, are death to the Morning Glory vines. It is a very troublesome weed here, but I have learned by experience that live stock will clean it out."

Willow Peelers.—"N. M. R.," Yanceyville, N. C., suggests that in an article on "Willows and Their Uses," in May last, we gave no information about willow peelers. We know that there are patented machines for peeling willows, but we do not know who makes them. With regard to patented articles which no one has a right to make or use without the consent of the patentee, we assume that the thing, if good for anything, will be advertised. It is not the duty of a journal to advertise articles, the exclusive owners of which do not care to bring them properly before the public.

Strawberry for a Name.—"W. M. M.," New Brunswick, N. J.—The plant is one of our native strawberries, *Fragaria vesca*, and is also found in Europe. It is the parent of the many Alpine strawberries. It differs from our more common varieties in having the "seeds" (akenes) upon the surface of the fleshy mass which forms the berry, instead of buried in it. There is also a difference in the plant's foliage and habit.

Striped Bug Once More.—This season we have given a long list of proposed remedies. We hear from several that the paper hung from a stick has been perfectly successful. Mr. C. W. Hutton, Fulton Co., Ill., sends us still another method of driving them off; he shakes calomel over the vines from a pepper box. The insects go off humming.—Isn't this classing calomel among the humbugs?

Late Chickens—Bantams.—Chickens must have very good care to get much size if hatched in August. They generally do well but rarely get their full growth, being checked by the cold weather. August and September are the most favorable months for raising bantams. The value and interest of these minute breeds depends upon their littleness, and the same causes operating as in case of other breeds, we get very minute and perfectly formed specimens. This fact it is well for bantam fanciers to remember and profit by.

The Wild Goose Plum.—Messrs. Munson & Wiley, Marcellus, Tenn., send us specimens of the "Wild-Goose Plum." It appears to be an improved variety of wild plum, but the specimens failed to reach us in sufficiently good condition to judge of their quality. Messrs. M. and W. say it "ranks among plums as the Concord among grapes and the Wilson among strawberries—the best to be had without great trouble." The tree is said to be healthy and a great regular bearer; the fruit is not attacked by curculio, early, and may be picked green and ripens on its way to market.

Plants Named.—First one word to our friends. It is with pleasure that we name plants for correspondents if they will only give us good materials. We cannot undertake to name plants from a leaf only, nor from small seedlings, neither can we bother with several specimens put together without numbers; if we were to give a list of names, the sender would be no wiser, for he would not know to which plants to apply them, and we cannot afford to describe each one so that he may know. Such things we must pass by. Neither can florists' flowers be named, generally, from dried specimens, i. e., to give the florists' or catalogue name of a rose, or pelargonium, or a verbenia. Leaves and flowers, and if possible, the fruit or seed pod, should be sent. Dried specimens are, as a general thing, more easily determined than those sent fresh. The latter usually reach us in a wilted or a decayed state. Dry the specimen in a large book or between papers, and send it, if small, in an ordinary letter, and if large, between thin pasteboards...

Mrs. A. Bowen, Loomis, Ill. A Syringa, or Mock Orange, *Philadelphus*, but too much broken to tell which. "H. L.," Memphis, Tenn. The Chick-Pea, *Cicer Arietinum*, one of the oldest cultivated plants, and was a few years ago

sold at a high price under various names as a substitute for coffee. The separate flower is some kind of mallow; cannot tell which without the leaves. "Mrs. M. Treat, N. J. We have not before seen the Elder, and would like to know more about it." "J. E. M.," Holyoke, Mass. The Alleghany Vine, *Adiantum ciliatum*, a fine biennial to cultivate. "Subscriber," Martha's Vineyard. Golden Aster, *Chrysopsis falcata*. "W. C. Gault, Ashland Co., O. The seed of a Paeonion, some species of *Lithospermum*, which one is not to be told from the seed alone.

"N. D. W.," Waverley Place, N. Y. *Tecoma foeniculoides*, a favorite plant to train along the rafters of green-houses and conservatories; requires a light, rich soil. "Mrs. M. F. Canandaigua, N. Y. The plant that produces buds on the edges of its leaves is *Bryophyllum calycinum*. The flowers are purple, and are not likely to be produced when grown as a room plant. It needs bottom heat, and to be kept rather dry to make it flower. Please send another leaf." "T. C. McCalla, Ky. Buffalo-berry, *Shepherdia*, as near as can be told from the leaves." "P. L. C.," Dancet, Mass. *Evonymus japonicus*, the variegated form: flowers small and greenish, not showy; cultivated for the beauty of its foliage. A number of specimens which require study are omitted.

Loss by Disease Among Animals in the United States.—Professor Gamgee has been carefully looking into this subject and we condense some of his statements in regard to the estimated value of the principal live stock of the country, the percentage of loss by disease during the last year, and the loss in money.

Value	Loss per cent	Loss in money.
Horses.....	\$743,368,890	6 \$44,608,138
Mules.....	98,845,000	5 4,942,250
Cattle.....	724,075,700	10 72,407,570
Sheep.....	71,931,255	8 5,754,500.40
Swine.....	184,943,865	10 18,494,386.50
Total.....	\$1,893,244,670 \$108,288,393.40

A Brace of Failures.—"McK.," Jeffersonville, Ind., writes: "Last year I raised a single plant of the Long-Podded Radish, (*Raphanus carolinensis*). It grew about 30 inches high, and produced 15 or 20 percent pods, varying in length from 18 to 34 inches. These pods, which were exceedingly tender, pungent, and agreeable to the taste, were of a brownish-purple color, many of them curiously curled or kinked, and all having a general resemblance to rats' tails. From seeds of this specimen I raised, the present season, some twenty plants, which are entirely destitute of merit. They are of vigorous growth, and literally hostile with pods, which, however, do not possess, even remotely, the rat-tailed appearance of their predecessors. They are pale green, stiff, sharply pointed, mostly about 8 inches long, tough, and with very little pungency. Evidently this is the result of crossing with the common radish. I conclude, therefore, that the *Raphanus caudatus* will not preserve its character in gardens where the common radish is cultivated. The Striped Japanese Maize, (*Zea Japonica*), which, as an ornamental plant, has beautifully striped foliage, was much admired last year, has also failed to maintain its reputation. In the specimens now growing in my garden only about one leaf in five is striped. In fact, it has so much deteriorated that, like the *Raphanus caudatus*, I do not regard it as worthy of further cultivation." [We cultivated the Radish in 1890, and when a year or two ago it was handed as a novelty, gave our experience—which was that it, with us, was a worthless thing. As to the Striped Maize, that depends upon how pure the seed is kept. We have seen it this year with as well marked leaves as when it was first introduced. Ens.]

Wheat Screenings for Chicken Feed.—The screenings of winter wheat, which consists in great part of broken and small grains and may be obtained at most flouring mills, are the best chicken feed we know of. This article is generally worked into inferior qualities of flour, and ought always to be sold or used as chicken feed. It goes further and is much better than corn or meal for young chickens or laying fowls.

Canning Peaches.—"J. W. H.," a dealer in preserved fruits in Boston, writes a strong protest against the way in which this fruit is put up for market, and asks us to request our friends in the Middle States to put up none but perfectly ripe fruit. To this we cordially say amen, not only with regard to peaches, but tomatoes and other canned fruit. The public cannot be imposed upon a great while. Canned fruit is just now popular, but if such unripe fruit as was generally put up last year is to be the rule, we shall advise our readers not to touch it, and as far as New York, the great market, is concerned, shall set the Board of Health on the track of the unwholesome stuff. Now, here is a chance for honest men to make a good thing. Let it be understood that a certain label on a can is a guarantee that the contents are just as good as can be, and that brand will in a year or

two run all the trash out of the market. A showy label will sell the fruit, but not to the same customer twice.

Old Postage Stamps.—"Inquirer."—The Government has no use for them. If the "young lady" wishes to collect a million, she can only sell them for waste paper. She is a humbug, and is imitating an English girl who played the same game a few years ago.

Name of a Tree.—E. Marcy, Kendall Co. The tree seeds you collected in N. Y. City were doubtless those of the *Ailanthus*. Some notes on this tree will be found in the *Agriculturist* for May and November, 1897.

Crops in a Young Orchard.—"S. L. G.," Jasper, Tenn., asks: "What is the best grass to plant in a young orchard? Is clover or other grass injurious to young trees? If so, what is the best crop to plant in an orchard?" Do not plant any grass or clover in a young orchard. The trees need to grow well until they reach maturity, or the age at which they should bear. Plant such crops as require manure and thorough cultivation, such as Indian corn, potatoes, squashes and all of their family, and root crops. Do all for the trees and take no more from the soil than is returned to it. After the trees have reached the bearing age, clover is the best crop.

Locusts.—"T. W.," Xenia, Ill., and "R. L. B.," Hooversville, Md., will find the Locust described and figured in Oct., 1896, and we cannot comply with their request to describe it at the present time.

Many-Leaved Clover.—Several have sent us specimens of 4 and 5-leaved clovers, but Mrs. Chas. Morse, of So. Natick, Mass., outdoes all the rest in forwarding 5, 6, and 7-leaved specimens. What is called a 4 or more leaved clover is not properly so. The ordinary clover leaf is regarded as a simple leaf, the blade of which is split up into three parts, and it is no more strange that it should divide into an unusual number of parts than that parsley should become curled, or that certain trees, as the beech, birch, and horse-chestnut, should have cut-leaved or skeleton-leaved varieties.

The College Courant, published weekly at New Haven, is a beautifully printed and well-conducted sheet, which is of great interest to all college students and graduates, especially to those of Yale.

An Early Tomato.—C. T. Crotie, Plainfield, N. J., sent us on June 22d a specimen of ripe tomato, which he thinks is a cross between the French Tree tomato, and the Early Round variety, and claims that it is earlier than Keyes'. Mr. C. does not tell us anything of the treatment of his plants. We could form an opinion of its earliness if we knew when the seed was sown, and the time when the plants were set out. Will friends who send us specimens of tomatoes, or other fruits, tell us all that is necessary to know about them?

Salting Cattle.—"J. A. S.," Dutchess Co. There is no doubt of the usefulness of the practice. It increases their consumption of food and water, and their thrift. The better way is to let them have access to salt in their pastures and eat what they like.

Several Thousand Bushels of Corn Cobs.—A. Wilmut, Ill. If the cobs are dry, burn them and save the ashes. They make a tolerable good fuel. Thrown into the barn-yard, or upon the compost heap, they will decay but slowly, and there is a positive excellence about ashes which we prize very much.

A Good Mangle.—Mrs. J. Thompson, Concord, N. H. Ironing by machinery is not yet an entire success. The most complete mangle we have seen only proposes to assist the landlady in the plainer part of her work. Towels, napkins, sheets, pillow cases, and all plain articles without buttons, are passed between two smooth wooden rollers under a pressure. The work is done very rapidly, and is neat enough to meet the taste of most housekeepers. The article is sold at the house furnishing stores in the cities, for about \$25.00.

Carbolic Acid for Parasites.—S. Flint, Minn. This article, in the form of soap, is a sure and safe destroyer of all vermin upon sheep and cattle. It is for sale at this office, with directions for use—40 cents per lb.; or in boxes, 3 doz. tablets, \$3.60.

Black Cayuga Ducks.—"M. R.," Troy. These ducks stand high with breeders. They have a few white feathers about the belly, and grow to a large size.

Relief for Farmers' Wives.—Mrs. C. Dudley, Washington County. The boarding of farm help often comes heavy upon the housekeeper. The best remedy is the building of farm cottages, and the employment of married men for help. A cottage can be put up without any large outlay of money, if there is good timber upon the farm. The laborer, of course, would expect to pay rent, and the investment in the cottage would pay better than bank stock. He would also be a consumer of the products of the farm, and thus furnish a home market. One-half, at least, of his wages would be expended in the supply of his table. Extra hands, by the day or month, could be boarded at the cottage, and this relieve the farmer's kitchen of much of its drudgery.

The New England Fair, with a very attractive programme and list of prizes, takes place at New Haven, Conn., the first week in September. Daniel Nealham of Boston is Secretary and business manager.

Tanning Lice.—Franklin Fomey, of Somerset Co., Pa., gets rid of lice on cattle and horses by making a strong decoction of white oak bark by long boiling, and washing the animals with it twice, three days intervening. He says it is the surest and cheapest remedy he ever tried. We have sometimes recommended a solution of alum, and known of its being used with good success. This is a powerful astringent also, and doubtless acts upon the insects in the same way as oak bark.

Thinning Root Crops.—An obvious truth is often better enforced by a simple engraving than

Fig. 1.—UNTHINNED. THINNED.

even by experience. Year after year men cultivate turnips broadcast, using too much seed, and never thinning out the crowded plants. Turnips almost always do much better sown in drills than broadcast, and if "mercilessly thinned" in the rows, so be it the ground is occupied, the difference in the crop is very great. This fact we have endeavored to exhibit, so that he who runs may read, and that he who reads may be reminded to put the truth of the statement to the test.

Fig. 2.

turnips growing with about the relative amounts of tops and roots upon one alone, and two close together. Figure 2 is a horizontal section, showing still better the great difference between thinned and unthinned roots.

Top-dressing after Mowing.—"G. S. G.," New Canaan, Conn. Liquid manure applied at this time is particularly valuable. Well-prepared composts, and coarse, strawy manure, we have also used to good advantage, as they afford a mulch for the roots of the grasses. Fresh stable manure we prefer to apply later in the season. Any mulch is valuable upon the fresh mown grass, and the most of it will disappear before the following season, so as not to interfere with the mowing.

Drilling Wheat.—The advantages of this practice are conspicuous in the wheat fields the present season. The report of the Department of Agriculture for April says, that "in every locality where wheat suffered from freezing, the drill fields are unscathed, while those which were sown broadcast are in miserable condition."

Advantage of Thrashing Machines.—J. Stanton Gould estimates the number of these machines in the country at 225,000, and that they save five per cent more of the grain, than the flail. This would save to the country more than 19 millions of bushels of grain, worth at least 30 millions of dollars. A strong argument for the use of improved machinery.

The Work-Shop is the title of an elegantly illustrated monthly, which, for a few months past, has been welcomed to our table. It is the American edition of a German monthly, devoted chiefly to the beautiful and useful art and trade. We Americans are too much given to half-way approving of the sentiment which would divorce beauty and utility. In this journal we have a celebration of their nuptials on every page. Ar-

tistic industry, or "art-industry," by which we understand the application of the rules of art and beauty to all kinds of manufactures, is the sentiment of the work. It is a 16 page quarto in covers, filled with beautiful designs, working patterns, and details. The price is 50 cents per number. Mr. E. Steiger is the N. Y. publisher.

The Minnesota State Fair occurs at Minneapolis, Sept. 29th to Oct. 21. Charles H. Clarke of Minneapolis is Corresponding Secretary and business man.

Milk Farming.—"W. E.," Kent, Ct. We are not able to state the profit of this specially over ordinary husbandry. The long railroad freight would be an objection, but on some roads, they favor those who are furthest from market, to induce farmers to go into the business. It is favorable to the making of manure, for most milk farmers resort to extra feeding in stalls to prolong the season and to secure the largest flow of milk possible from their cows. The pay comes regularly and in considerable sums. An incidental advantage of this kind of farming is that it lends to keeping accounts. The milk farmer is likely to know how much a quart of milk costs, and what kinds of feed will produce the most.

The Potato Beetle.—The Colorado Potato Beetle, the 10-lined Spinnier, was figured and described in September, 1896, and has been mentioned several times since. No well-tested remedy has yet been proposed. Mr. C. V. Riley, Missouri State Entomologist, thinks—and his opinion is worth considering—that a heavy mulching of the soil would in a great measure prevent the eggs of the insect from the earth in the spring, and the few that do come out could be readily managed; but for this to be of effect, a combined effort is necessary. Note.—Please do not send us any more specimens of this insect. We know it by sight thoroughly. A few days ago we received a package which contained a crushed box with some hundreds of these fellows all alive. Had the paper broken, the insects would have found their way out of the mail bag, and their eastern march would have been more rapid than it now is. If any of these are to be sent East, or elsewhere, let them be first made specimens of by exposing them to the heat of boiling water, which will kill them "very dead."

The New York State Fair is to be held at Rochester, Sept. 29th. An important regulation has been adopted by the Society, which will be put in force this year. It is that all entries for *Live Stock* and *fixed machinery* must be made two weeks before the fair, namely, on or before Monday, Sept. 14th. The Corresponding Secretary, Col. B. P. Johnson, must be addressed at Albany.

The Ohio State Fair takes place at Toledo on the 21st to 25th days of September. It is under the direction of the Ohio State Board of Agriculture, of which John H. Klippart, Columbus, is Secretary.

The Indiana State Fair is to be held at Indianapolis, beginning Monday, Sept. 28th, and continuing through the week; \$12,000 are offered in prizes. The Secretary is A. J. Holmes of Indianapolis.

What is a Pullet?—"W. H. L." Questions of the age of fowls often arise at the exhibitions and where fowls are sold. An English authority decides that "age does not constitute a pullet," saying that fall birds of one year cannot be shown in June of the next year as pullets, yet that January birds may be shown as pullets in December of the same year. This is nonsense; a hen less than a year old may properly be sold or exhibited as a pullet, and in common parlance a hen is a pullet until she has laid out her first clutch of eggs, or had time to do so; and this would stand in law or equity.

Diarrhea in Chickens or other poultry may be checked by putting them on a floor of dry sand, and feeding lettuce leaves, which are better if taken from old plants, chopped fine, and mixed with Cayenne pepper.

Reclaimed Swamps Relapsing.—"J. A.," Livingston, N. J., asks: "What is to be done?" Rushes, and the wild grasses coming in, show the presence of water too near the surface. The drains should be made deeper, and perhaps be doubled in number. Much of the draining in such places is only half done. A second row of tiles, bringing the drains only 24 feet apart, will often pay better than the first. Plowing is not always necessary. Grass seed catches very readily upon mucky soils, especially if the sowing is accompanied by top-dressing. White and red clover do well upon rather moist soils, and should always be mixed with the grass seed, if the object is hay. Reclaimed swamps will not take care of themselves any more than upland meadows.

Sugar Maples Die.—"J. H.," Prairie City, Ill., says that Sugar Maples, when set out, "grow very well the first season, but die the next," and asks how to prevent this. Many such questions go unanswered, because we have no grounds upon which to have a reply. Take this for an example. There is no clue to several important points. Are they nursery trees, or trees from the woods? How were they taken up? Were the tops headed back? From what soil were they removed, and in what kind were they planted? Do the leaves hold on until frost, or do they die before maturity? Do they come out the second spring, or are they apparently winter-killed? One must know all these points, and others, before he can, without seeing the trees, give any intelligent answer to this query and others like it.

Asparagus and Roots.—"C. E. P.," New York.—By all means plow up your soil this fall, and then again in spring. Such a soil as you describe, well manured and thoroughly prepared, should give good results.

Libraries for Farmers' Clubs.—"G. A.," Waukau, Wis. Nothing better could be devised to perpetuate these institutions and increase their usefulness than a well-selected library on agricultural topics. A yearly tax of a dollar on each member would furnish a fund for its gradual increase, and all the best works would be made accessible to the whole community. It could not fail to be a good investment for every member. In any of the flourishing farming towns of the West we should expect the experiment to be successful.

Very Early Potatoes.—Samples of the Early Rose Potato, weighing 4½ oz. each, were exhibited at the *American Agriculturist* Office, July 8th. They were grown in Westchester Co., N. Y., in the open field, from potatoes planted May 30th. We have seen other samples, equally good, grown in from seven to nine weeks, which show this to be the earliest variety known.

Goats in California.—Mr. Landrum, of Watsonville, Cal., informs us that on the spurs and in the mountain valleys of the Coast Range and other mountain chains of the Pacific coast, there exist numerous plants, which, if eaten by our common domestic stock, are very deleterious if not fatal in their effects. These constitute even favorite articles of diet for goats of all kinds, neither proving harmful to them nor imparting flavor to their milk.

Abdominal Tumors in Fowls and Turkeys are not of rare occurrence. They usually arise from some disordered condition of the laying apparatus, and will be eventually fatal. If you perceive a hen or turkey in good condition not moulting, and refusing to lay, and having a low abdomen, cut off her head in time—before she becomes diseased and unfit for food.

Wastes of a Photographic Establishment as Manure.—H. Noss, Staten Island, asks: 1. "Can hypophosphite of soda which has been used for fixing photographs be used as a fertilizer?" We should consider it a fertilizer of moderate value if mixed with deleterious substances. Mix it with loamy soil or manure, and make an experiment upon cabbages and turnips.—2. "How can liquid ammonia be used? I have some that is too weak to be used in the business." Be very careful, dilute it freely, and apply it with a sprinkler on grass, or almost any garden vegetables. It should be so dilute that you can hardly tell it from pure water.

Canning Peas and Corn.—Once more we must repeat, to reply to several, that we know of no way in which peas and corn can be canned, with any degree of certainty, in families. Those who make a business of it seal them in cans, boil for a while, (in water or steam,) punch a hole in the cans, to let out the steam, solder the holes up, and boil again for several hours. In the most experienced hands the process often fails, and it is regarded by experts as an uncertain business.

Check for Cribbers.—Mr. J. B. Knox, of Worcester, Mass., has used the hitching rein and rod described on page 139 (April) for several months with the best results, and claims to share the honor of inventing so useful an article with the gentleman whom we named when it was described. If this were a patent worth half a million, there would be a nice chance for a lawsuit.

Hen Killed by Eating Glass.—"Mr. E. W. W.," of Tuckahoe, brought to the office of the *Agriculturist* several pieces of glass taken from the crop of a hen which died suddenly. The glass cut the crop, and no doubt caused her death. It is probable she had been accustomed to picking up ice and snow for drink and made a fatal error in confounding glass and ice.

Missouri State Entomologist.—The State of Missouri has had the good sense to create the office of State Entomologist, and then showed that it knew what it was about by appointing C. V. Riley, Esq., to fill the office. Mr. R. has long been favorably known through his writings in several of the Western agricultural journals, and his course since his appointment shows that he means work. Instead of secretly accumulating a lot of materials for the long-delayed report of some slow-going Society, he gives his matter while it is fresh and in season through the Missouri and other Western papers. We hope that our many Missouri readers will aid Mr. Riley by sending him their observations and specimens of such insects as are found injurious to vegetation. His address is 2130 Clarke Avenue, St. Louis.

Strawberry Dr. Nicaise.—Messrs. Frost & Co., Genesee Valley Nurseries, Rochester, N. Y., have sent us specimens of this berry, which we believe they were the first to introduce. The berries, grown from plants set last September, were of remarkable size. One weighed an ounce and a half and measured seven inches around. The fruit being picked under-ripe, on account of the long distance it had to travel, did not enable us to fairly test its quality. The flesh was solid and of good texture. We are not informed of its productiveness, but the specimens sent show that it is an excellent exhibition fruit, and worthy the attention of cultivators.

Another Tomato Trellis.—"F. B." of Newark, N. J., surrounds his garden with a very cheap trellis upon which he trains his tomatoes. The trellis is made of sticks cut from the swamp, set in an inclined position, and where they cross they are tied with a strong twine. When the tomatoes reach the top of the trellis the tops are bent over to the other side and there fasten-

ed. The sticks are completely hidden by the foliage, amongst which the ripe fruit shows with a very pretty effect. A trellis of this kind made of cedar would last many years. The engraving shows how it is constructed.

Fruit in New England.—Very unfavorable accounts come to us from various parts of New England, and the prospect for fruit is anything but promising. The long-continued rains which occurred at the time of blossoming of apples and pears prevented fertilization. Col. Wilder informed us that he should not have more than a third of a crop of pears, and that on July 1 he had not a grape vine in blossom. Many usually hardy vines were killed by the winter, the wood not being well matured. At the Botanical Garden, Cambridge, the Magnolias, etc., bloomed a month behind their usual time.

Fuller in German.—The Small Fruit Cultivist, by A. S. Fuller, has been accepted as a standard work by our fruit growers, and we are pleased to find it has met with so much appreciation in Germany that a translation of it has been brought out in that country. The book is in excellent style, with all the illustrations neatly done in tinted lithograph. The translator is F. Manner, who is one of the leading small fruit growers in Germany. The work so pleased Jubike, the director of the King's gardens, that he requested to be allowed to write an introduction to present it to the German pomologists. This translation in so handsome a manner is a great compliment to Mr. Fuller, and not only to him but to American horticulturists generally, for all of them have in one way and another helped to bring our knowledge of the small fruits up to its present state. It is pleasing to see that German pomologists are ready to avail themselves of experience, from whatever quarter it may come; their conduct is in marked contrast to those of England, who persistently ignore American horticulture.

Whitlock's Exhibitions.—Mr. Whitlock, besides his "perpetual exhibition" of implements pertaining to horticulture and agriculture, has every Thursday a show of such fruits and flowers as may be in

season. Mr. W. in the spacious halls in the Agriculturist building is able to offer ample room to all exhibitors, and a neatly furnished room for discussions. Our fruit growers and florists have availed themselves of advantages he offers, and the exhibitions have been attractive and the meetings for discussion instructive to those who attend. These weekly exhibitions and meetings are free to all.

Gas-Tar or Asphalt Walks.—In the July *Agriculturist* we mentioned the walks in Central and City Hall Parks as illustrations of the excellence of pavements made with gas-tar and other materials. We have since learned that these walks were made with a patented composition under the Barlev patent, in which other materials are used besides gas-tar. As the report of the controller of Central Park gave no hint that the walks there were made with a patented article, we were led to suppose that they were the old gas-tar and sand walks that have been in use these many years. We know that mere sand or coal ashes and tar make a good walk, but are willing to admit that the patented one is better.

Hill's Lawn Mowing Machine.—A lawn mower of moderate size that could be worked by one person without great exertion has long been wanted. We have tried Hill's machine sufficiently to see that it does the work easily and efficiently. By the use of this machine once a week, a lawn of grass plot can be kept in admirable order with a velvet turf. We hope that the manufacturers will have so great a demand as to allow them to furnish the mowers at a still cheaper rate.

Massachusetts Horticultural Society.—The exhibition of Roses, Strawberries, etc., was held by this Society June 30th and July 1st at their magnificent Hall in Boston. The number of varieties of strawberries was not so great as we expected to see, but those exhibited were of remarkably fine quality. Wilson, Hovey, Juconda, Triomphe de Gand, Brighton Pine, Agriculturist, Boston Pine, and Scott's seedling, were the principal varieties. Notably well grown specimens of all these varieties were shown. Col. Wilder's seedlings attracted attention; these are referred to elsewhere. Roses were on, like Sophy Squeers' sensibilities, "in full bloom." F. Parkman, author of a work on the rose, gave proof that he could raise roses as well as write about them. H. H. Hunnewell and J. C. Chaffin had collections as fine as they were profuse. Hovey & Co., exhibited beautifully grown specimens of the rarer green-house plants. E. S. Rand, Jr., had a good seedling *Azalea*, valuable for its late blooming, and garden specimens of the charming Showy Ladies Slipper, *Cypripedium spectabile*. Some most gracefully arranged baskets and vases were upon the tables. Amidst all the display of exotics we were glad to notice a stand of our native wild flowers, with their names, a very pleasing and instructive collection. The exhibition was a success, but one in visiting the Fêtes of the Massachusetts Society sees more than fruits and flowers; he meets the men who by their persistent labor have made this the most prosperous of our horticultural societies. It is good to meet such men as Col. Wilder, Breck, Parkman, Buswell, Brackett, Rand, Hovey, and a host of others eminent in the horticultural world. We wish some of the wealthy men of New York could see how things are done in Boston. They might be shamed into doing something for horticulture in their own city.

White Hellebore for Squash Bugs.—W. B. Waterer, Troy, N. Y., writes that his vines being covered with squash bugs he dusted them with powdered White Hellebore while the dew was on, and has seen nothing of the insects since he made the application, which was some four weeks previous to the date of his letter.

New Jersey State Agricultural Society.—This Society held an Exhibition on June 23d and 24th, at their new grounds at Waverly. Everything about this Society bears the marks of energy and determination to achieve success. The grounds are naturally well adapted to the purpose, and the improvements made and in progress are judicious and substantial. Gen. Halstead, the President, and Mr. P. T. Quinn, were untiring in their exertions to promote the convenience of exhibitors and the comfort of visitors. The fine large tent of the Society was decorated by abundant floral contributions. An excellent show of vegetables was made by B. J. Quinn & Bro., of James Island, S. C., grown upon land heretofore devoted to cotton. Reisig & Hexamer, Westchester Co., N. Y., exhibited over 50 varieties of strawberries. F. Brill, Newark, N. J., took the premium for the best collection of 10 varieties. E. W. Durand, Irvington, N. J., exhibited 7 new seedlings, some of which were of marked excellence. P. W. Schenck, of Irvington, showed specimens of Boyden's No. 30, which attracted general attention for their enor-

mous size and fine appearance. Romeyn's Seedling was well represented by plants in tubs, and the fruit upon plates. We are glad to learn that the exhibition, notwithstanding the rainy weather, proved a pecuniary success.

The Study of Insects.—Doctor A. S. Packard, editor of the *American Naturalist*, has commenced the publication of "A Guide to the Study of Insects," which will be issued in 8 or 10 parts. The first part contains a profusely illustrated account of the anatomy of insects, their transformations, etc., and supplies information upon points in which our few American works on insects are remarkably deficient. Price 50 cents each part, to be had at the office of the *American Agriculturist*.

Propagating New Strawberries.—Mr. Seth Boyden, so well known as a successful grower of some remarkable varieties of strawberries, sends us the following: "The strawberry plant is subject to many variations from external causes, which should be avoided when the highest success is desired. The best varieties will retrograde if they are neglected and choked with weeds, or grown too thick, or in sterile soil, and will become an inferior variety, requiring years of good cultivation to restore them to their original condition. For a new setting the best plants should be selected from healthy parents, with large runners, and carefully handled. An injury to the plant is an injury to the future crops. If the roots are broken or tangled, the plant will never fully recover. The young plants should be set as soon as they have roots sufficient to sustain themselves, and not wait for water before they have become firm in their place. New land or soil not much worn is preferred, and should be trenched a foot deep under the rows and a layer of manure put on the subsoil or bottom of the trench. If the soil is heavy and liable to dry hard, a small quantity of fine manure should be added, and well mixed before the trench is filled. The roots should not come in contact with much strong manure, but after the plants have become firm they may be liberally top-dressed."

A Watering-Pot Sprinkler.—Mr. S. Fisher, Framingham, Mass., sends a drawing of a rose

or sprinkler for a watering pot, which he finds very convenient for directing the jet in any desired direction. The form is sufficiently shown in the annexed engraving.

Michigan Rose.—"W. B. W." This may be propagated by layering shoots of this season's growth.

How to Tell a Pure Brahma Fowl.—John Flegg. A bird which is true to feather may not be of pure blood, as for fowls are not bred with the same accuracy as Short horns, we must always expect to find occasional departures from the marks of absolute perfection in well-bred fowls, and also occasionally grade birds taking so strongly after the prevailing blood that they cannot be recognised. If the stock at six to eight months old is well marked, this would, in our mind, establish the purity of well-marked parents, and nothing else will. Brahma fowls fit to breed from should have small heads, single or triple combs; large, full bodies; broad chests; short, flat backs; large, strong thighs down to the hocks; short and feathered legs; clean feet, with the outside and middle toes well feathered. The plumage may be either white, with a dark penciling on a grayish brown on the neck and back, and dark on the breast and body, or very light. This leads to the distinction between light and dark Brahmas. The dark birds have a light head and black flight and tail feathers. The light Brahmas which are the most common in this country are preëminently white, with the neck hackle and saddle penciled with a distinct dark stripe in each feather. The tail is short, erect, and black, and the wings are short, with the flight feathers black. The body fluff or down is usually white, but occasionally smoke colored, while the feathers are white, and the feathers of the feet and legs are more or less dark also. Long feathers projecting back from the hocks, (called "vulture hocks.") are undesirable, but do not show impurity or bad breeding. Single combs are admissible, but we do not like them. The legs should be yellow, or dusky yellow, and always well feathered. White-necked birds should not be bred from. Neither are those pure enough which have dark feathers scattered about on the body, or anywhere except properly penciled on the spots indicated above. Early chickens get their true plumage in the autumn, but late ones often do not show their true feathers until six months old.

Savings Banks and Farmers.—"A. N., Lebanon, Ct. "Where shall we get capital to make improvements?" We recently visited a rather poor farming district in your State, and learned that almost every man had a snug little "pile" in the Savings Bank. In the State of New Hampshire, the reports show about fourteen millions of dollars in the Savings institutions, the most of it the spare capital of cultivators. Your State is still richer in capital, and would divide more, *per capita*, than any other State in the Union. These banks are not a fair index of the surplus wealth of the farm, for since the war the favorite investment has been in United States bonds. A farmer who has faith in his business need not go far to find capital to make improvements. There are many small capitalists among farmers always ready to loan, who prefer an indorsed note, or a mortgage on real estate, to any other security. Savings Banks are ready to loan on long terms on similar conditions. There is really no lack of capital to make any improvements upon the farm, that are desirable. We have no doubt that these spare funds invested in draining, in the raw material of manures, in better tools and stock, would pay a larger interest than in banks. Farmers need more faith in their business, rather than more capital.

Canada Thistles.—The Journal of the N. Y. State Ag'l. Society says: "The Illinois Legislature has passed a law providing that any person bringing into the State seed of the Canada thistle, in the packing of goods, grain or grass seeds, or otherwise, and permitting the same to be disseminated and vegetate, shall be liable to a fine of \$400; and any person allowing this thistle to mature and disseminate its seed upon his lands shall be subject to a penalty of \$75." Good for Illinois.

Thills for Horse-Hoes and Cultivators.—"D. F. Jr., Ira, Vt. Thills have been introduced to the use of late, and work well. They give greater steadiness to the implement, so that there is less danger of damaging the crops, and at the ends it is more easily transferred from one row to the other by lifting.

Breeding of Water Fowls in Large Flocks.—"P. J. A., Cooperstown. There is not the same danger in large flocks, as in the case of hens and turkeys. In a state of nature many varieties breed close together and make their spring and fall flights in large flocks. In Norfolk, England, geese are bred in large numbers. A Mr. Bageshaw, a farmer there, fattened 12,000 for market last year. With a good pond, or running stream of water, there is not much danger of overstocking. It will not pay to breed them in pens.

How Much Pork a Day?—"S. B. D., Fremont, O. A pig put up to fatten and well fed, that does not gain one pound or more a day is not making a profitable use of his provender. A pig nine months old, and kept three months in the pen, ought to weigh 300 lbs. Some do much better than this. D. Edwards, of Little Genesee, N. Y., fed two Chester White pigs, which gained 236 lbs. in 88 days. They were fed on cooked corn meal, wheat, soy milk, and clover, and returned 11½ ounces of flesh for 1 lb. of meal, not reckoning the other food.

Sheffield Scientific School of Yale College.—This school received the U. S. Agricultural Land Scrip. The Annual Report made to the Legislature has been received. The school is making progress in all departments, and offers an opportunity for the study of the sciences bearing upon agriculture and of theoretical agriculture which cannot be excelled on this side of the Atlantic. The fall term this year begins Sept. 16th. There are 125 students in all departments and 21 professors and other instructors with abundant facilities.

A Curious Sheep Story.—The following we clip from the N. Y. Evening Mail, thinking our readers will appreciate a bit of nonsense this hot weather. The remarks by the Mail will be best appreciated if they are read aloud. "Robert Batchelder, of Salisbury, has a flock of twenty-eight sheep, which during the winter were housed in a place where their wool became filled with hay seed. They have been out to pasture for several weeks past, and the excessive wet weather has caused the seed to sprout, and they are now bearing about with them a crop of grass two inches in length. It is thought that if the wet weather continues much longer the clover will blossom."—*Monitor.*—REMARKS BY THE MAIL.—This is the most interesting story that ever we have seen, concerning some New Hampshire sheep who are wearing of the green. "Twice lashed by a person on whose honor we rely, he never hacked off cherry trees, and—shouldn't tell a lie, Robert Batchelder, this was the shepherd's name, and he pastured twenty-eight sheep on Salisbury plain. But when the leaves had fallen, and November

winds were chill, why, out on the open world they couldn't get their fill, so Bobby kindly put them in a well protected shed, with hay enough to feed them, in the mow up over head. And the seed it sifted down and it lodged in their wool, and there it did remain, till the April moon was full. And then out went the matrons, all in the rain, you know, and, in less than twenty-one days, the seed began to grow; and it grew, and it grew like the bean in fairy song, and now the grass upon their backs is more'n two inches long. And, it is expected, that, later in the year, red, fragrant clover blossoms will appear! The moral of this sheep tale is clear to every eye, that by judicious management, if a person cared to try, he might, with little trouble, and with aid of rainy weather, have his lamb and green peas growing up together.

When to Shut up Pigs for Fattening.—"L. O." Morrinstown, N. J. If the pens are furnished with shelter and with water, we should say hogs in August. A pound of pork is made much more economically in warm weather than in cold. Little green is wasted in keeping up the animal heat, and many green articles are available which are out of season late in the fall. Swine enjoy fresh clover fed every day with their cooked corn or provender. Sweet corn ought to be raised for the purpose of feeding in the green state to swine. It greatly promotes their thrift, and, we have thought, makes flesh as economically as any food that can be given.

Swarming—Artificial or Natural?

—Wm. W. Cary writes: "I am often asked 'Do you practice natural or artificial swarming?' A direct answer to this question would not show the best course for you to practice, unless all the circumstances are similar. If your apiary is large enough to occupy your whole time profitably during the swarming season, then natural swarming may be recommended, but for one who has only a few stocks, it will not pay to watch for swarms to issue. Some, whether their apiaries be large or small, have occasionally to be from home for a day or two, and such have a constant feeling of anxiety that swarms will be lost during their absence. Thus, it becomes important to study and practice artificial swarming. It can be done in the old-fashioned box hive, but with greater facility and certainty of success if the movable comb hive be used, and easier with shallow frames than deep ones."

Bees in August.—By Wm. W. Cary.

—Remove all surplus honey as soon as sealed. Examine carefully all old stocks that have swarmed, to determine if they have a fertile queen. Where many hives are in a row, young queens are sometimes lost in returning to the hive. Such have not the means to rear a queen, and must be either supplied with eggs, sealed queen cells, or a queen, to avoid total loss by rapid depopulation and robbery. Keep a few queen-raising "nucles" for such cases, and to provide a stock of queens to take the place of supernumerated ones or of those known to be drone layers.

The Best Cross for Mutton.—"L. D., Litchfield, Ct.

All the thorough-bred sheep are quite too dear in price to be raised for the butcher. The fine-wools generally are small, and would not pay for this purpose. The long-wools furnish quite too much fat in proportion to the lean to be profitable for the consumer. The South Downs furnish an abundance of fine-grained, lean meat, and are only defective in size. If we cross the common Merino ewes of the country, (which are a mixture of "native," Saxony and Spanish Merinos,) with South Down rams, we obtain a favorite class of lambs for the New York, and we presume all Eastern markets; they are hardy, mature quickly, and show strongly the South Down points. If we cross South Down ewes, or these grades, with a Cotswold or Leicester ram, we shall increase the size, secure a more rapid growth, with flesh of excellent flavor. If the object be to furnish early lambs for the butcher, this is perhaps as good a cross as could be made. The very high prices paid for lambs in May and June make it very desirable for farmers to have a good stock on hand. A lamb four months old is often worth more than a yearling. The crosses we have indicated are highly prized by the mutton producers who supply the market at Norwich, England, where, upon an average, six to eight thousand yearlings are sold every week.

Timely Hints About Thrashing, etc.

Thrashing Grain.—"The best of men are none the worse for a little watching." This is true of that important class of men "the thrashers." The work is generally done by the bushel. In New York the old price was 3 cents for oats, 4 cents for barley, and 5 cents for wheat. Last year, owing to the anxiety of farmers to thrash early, under the idea that the price of wheat would decline, six and seven cents a bushel was paid.

Of course the thrashers are desirous of doing the work as rapidly as possible, and this is very well, especially as the farmer has to furnish six horses and half a dozen or so of men, besides the four horses and four men that accompany the machine; but owing to their anxiety to "hurry up" it is well to see that the grain is all thrashed out of the straw, and also that it is separated from the chaff, and not carried on to the stack by the straw carrier. The "boss thrasher" is generally a "gentleman of leisure," who "sees that everything is right." Would it not be well if the farmer himself, instead of working harder than any of the other men, should hire an extra hand and merely look after things? High as wages are, one bushel of wheat saved would pay for a man that could cut bands or throw sheaves from the bay nearly, if not quite, as fast and as well as himself. Of all days in the year thrashing day is the time for the farmer to see that everything is done as it should be. This is work enough for one man, which should be the farmer.

Stacking Straw.—It is rare to see a properly

built straw stack. If the straw is designed for simply treading into "so-called manure," it is often left after the machine is gone in a shape admirably adapted for the purpose. But vice, bright straw, especially if the grain is sent before it is dead ripe, is very readily eaten by stock in the winter and is certainly worth preserving for the purpose. Any man of ordinary skill can build a straw stack. The main point is to get good-sized forks to place compactly round the outside, and another series of similar forks to put inside and partly on top of it to bind the outside tier. Tread firmly and keep the middle well filled. It is better to arrange to put all the straw in one large stack, rather than in two or three small ones, and it is better to have it a little too high than too wide with a flat roof. It may take an extra man to make the high roof, but it will pay. Another point to be specially attended to is to throw the chaff into the middle of the stack, or at least not to leave it in a heap where it drops from the carrier. The weak spot in the stack, and where the rain is almost sure to do the most damage, is on the side next the carrier. Special care should be taken to get the chaff and short straw away and to build up around the carrier with long straw. Two men on the stack, for a ten horse machine, is enough at first, but as the stack gets higher three will be needed. Better put on four, even, than have a poor stack. But it is not necessary. Let the farmer lend a helping hand on the stack occasionally, if necessary, and see that all is going on right. If thrashing out of doors, see that the chaff and fine straw which fall on the ground are thrown on to the carrier. Do not let it accumulate, for if the man gets behind he will be apt to throw up grain also. The farmer had better watch these things than work steadily himself. Let the stack be finished off at once. If this is neglected at the time it will seldom be done afterwards. Every bit of straw should be on the stack before the machine stops. And then make some sheaves by drawing out straw from the sides of the stack, and fill up the hole where the man stood on the roof and make the whole roof so that it will shed water. We advise, as the result of our own experience, that this be done at once and the stack finished off as though you were sure of a heavy rain before morning.

Thrashing Wheat as Drawn from the Field.

—Where it can be done, this is unquestionably the best and most economical plan. If portable steam engines were as common as they will be in a few years there would be no difficulty in thrashing as drawn from the field. Two extra men is all that is needed. But we now require two extra teams also, and these are not always to be had. One man can pitch as fast as any ten-horse machine can thrash. Our plan has been to have three wagons and two teams, with one man to each wagon, who loads and unloads. We built a small stack by the side of the machine, holding perhaps a load, on which the man stands who cuts the bands. While changing wagons, sheaves are taken from the stack, so as not to stop the machine. Let the farmer give up all idea of doing any regular work himself, and attend to the changing of the wagons and furnishing the sheaves, and there will be no trouble. Put a steady man in the field to pitch, and a load will always be ready to take the place of the empty wagon. There are men enough around the machine to run the empty wagon out of the way, and the other is in its place and the man throwing off sheaves in less than two minutes. There is a little excitement about it, when everything goes right, that stimulates activity. With favorable weather and on a large farm we would never thrash wheat in any other way. Where there is sufficient barn room, thrash out of doors and put the straw in the barn. It is then safe, and can be fed out more conveniently and with less waste than from the stack.

The Outside Horse on a Sweep Power has to walk much faster than the inside horse, and consequently should have a longer half of the whiffle.

tree. On a ten-foot sweep the outside horse walks 60 feet each time round, while the inside horse, two feet nearer the center, walks only 58 feet. In other words, the outside horse walks one fourth faster than the inside horse. He walks 5 miles while the other walks 4 miles. To ask him to draw as heavy a load is cruel. On an ordinary 4-foot evener a new hole should be bored from 4 to 5 inches nearer the center for the inside horse. With a short whiffletree, say 30 inches from the center hole to the outside hole, the hole should be bored for the inside horse 16 inches from the center. Thrashing is hard work for horses at best, and this matter should be attended to. The thrashers give the inside horse of their teams a shorter half of the whiffletree, but three-fourths of the farmers let their horses draw on the machine with ordinary plow whiffletrees without alterations. For the sake of the poor horses we ask attention to this matter.

Guard Against Splitting.—Females or rings of iron are useful things, but among a score of old ones it will be a rare chance to find one that will fit where one wants it; besides, they are not applicable to angular sticks. "J. H. M." gives us a sample of a simple protection against splitting, which we think may find a wide application in our own hands, and on the farms of our readers. Figure 1 represents the end of a stick like a whiffletree, protected by a simple iron wire, applied thus: A groove is cut in which the wire may lie, as it

FIG. 1.—GUARD AGAINST SPLITTING.

turns over the end; one end of the wire is bent at right angles and driven into the stick, a hole being bored if necessary. The wire is then laid round in the groove, cut of the length needed, the end bent at an angle of 45 degrees, sharpened, and driven in with drawing blows, so as to tighten the wire as much as possible. The end of a stick with a hole in it, as represented, will bear quite a strain before it splits or breaks. Our correspondent

FIG. 2.—WIRE APPLIED TO A LATCH.

accomplishes this suggestion with a simple latch, fig. 2, for a gate or barn door, the catch of which is made of a knot—a guarantee against its splitting off, and a capital idea of frequent application. The dotted lines in fig. 1 show the course of the wire where not really in sight, and the same may be observed on a small scale in fig. 2.

Gas Tar for Paint.—"C. G. F." Bennington, Vt. It is used in many places for cheap fences not bordering the highway. There is no doubt about its antiseptic qualities, and it is always cheap near the place of manufacture. Beauty is not its strong point.

Harvesting Field Beans.—Take five rows at a time. Commence on the middle row; pull up as many hills as can conveniently be held in the hands, and then place the handful, with the roots on, on the row. Then pull the two rows on each side, and place the handful round the first on the middle row. Pull a few paces ahead of the heap and bring the handfuls back. Then proceed as before. Sometimes the beans are put in a continuous windrow. The work is usually done by boys, and if the crop is clean, a boy will pull half an acre a day. The heaps or windrows should be moved or turned every day or two; and if the weather is bad, the crop must be carefully watched, and every opportunity seized to turn the heaps and get them lightened up. A little neglect may spoil the crop, or at least render hand-picking necessary. Ordinarily there is little difficulty in curing beans in this way, provided they are not neglected. When sufficiently cured they are thrown into heaps of convenient size for pitching. If the beans are dry and hard, and the vines perfectly cured, they can be mowed away like hay or grain; but if little green, it is better to put them on poles laid across the beans in the barn, where the air can circulate through them. Careful bean growers frequently stick short stakes in the field, and place the beans around them, that the heap with straw, and let them remain, if need be, for several weeks. When this method is adopted, the beans can be pulled while the vines are quite green, as the half-matured beans will ripen from the sap in the pods and vines. By this method, too, there is little loss of leaves, and these, with the pods, constitute the most valuable portion for fodder.

Going into Wells.—As a rule, never descend into a well without first lowering down a candle or lamp to be sure that it does not contain foul air. Wells in barn-yards that are used in winter for stock, and seldom used in summer, are very liable to be foul at this season. While the springs are low in August or September, is a good time to clean them out, but let no one go down without using the above precaution. The "foul air" is carbonic acid, and no one can live in it an instant. If a candle or lamp will burn freely there is no danger. The carbonic acid is heavier than common air, and accumulates at the bottom of the wells. The candle will go out as soon as it strikes the carbonic acid, and thus show how much there is in the well. To get it out is not difficult, provided there is water in the well. All that is needed is to pump out the water and dash it in again. The water will absorb an equal volume of carbonic acid, and the agitation will mix sufficient air with it to allow combustion to proceed, and if a bundle of straw is ignited and lowered into the well, the heat will cause the foul air to ascend. We have succeeded in getting out the carbonic acid from a well simply by dropping bunches of burning straw into it. The blaze would at first be extinguished when it struck the carbonic acid, but the heat is more or less retained, and sets the air in motion.

Michigan Board of Agriculture. By Sanford Howard, 1867. This is the Sixth Annual report of this body, and besides the usual tabular accounts, and reports of the County Societies, it contains carefully prepared essays upon the management of Agricultural Societies, Irrigation, Cheese Factories, Cross Breeding of Sheep, Principles of Hay Making, Influence of Forests, Diseases of Cattle, and other matters of interest to the general reader. Strong ground is taken against the perversion of agricultural fairs by the horse jockeys. It claims for the New York State Agricultural Society that it has from the beginning steadily refused to tolerate any of these gambling or clap-net affairs, and yet has had a larger share of public patronage than the Societies that have relied upon trials of speed to draw the people.

Dairy-maids.—Mrs. S. Thompson, L. I. It is not difficult to find servants who are somewhat acquainted with the management of milk, and who, with a little instruction in our American methods, make good dairy-maids. We have had quite good success with men-servants just arrived, and rather prefer to have their first training in this country. It is harder to get good maid-servants among the "greenhorns," and if they have skill enough to make good butter and cheese, you will of course have to pay more for them than for ordinary servants. The labor market is well supplied, and the offer of good wages will ordinarily procure what you want.

Weight of Cotswood and Leicester Sheep.—"J. S." Kinderhook. We recently saw a notice of a lot of yearling rams raised in Canada, that averaged 256 lbs.; of two year olds, that averaged 341 lbs. live weight. These breeds must have rich pastures in summer and generous feed in winter.

A Grazing Country.—A. Beckman, Putnam County. The whole Allegheny region extending through Virginia into East Tennessee, and the west part of the Carolinas, and Georgia, is a fine grazing country. Red and white clover and the fine grasses of the north will flourish in this region, and it is generally healthy—probably quite as much so as any part of the northern States. Slaves have always been few, and public sentiment is more friendly to northern people than in the cotton growing districts. Many have bought in this region, and lands are still cheap. One with experience in the grazing of cattle would do well in any part of this region, in fattening them for market. It is much nearer than the prairies of Illinois, whence a large part of the supplies of New York city are drawn. Southern Missouri is also a very fine grazing region, and is fast filling up.

Abortion Among Cows.—J. Bonner, Monroe Co., Pa. The Commissioner appointed by the State of New York to examine into the cause of this disease do not venture upon an opinion. They have visited 1,577 farms, and received 4,259 reports from the districts afflicted, and yet, in the opinion of the best medical talent the State can command, the cause of the trouble is undiscovered. Editors may be a little modest after this.

Glazed Tile for the Outlet of Drains.—"G. F. H." Taunton, Mass. The crumbling of the common brick tile at the outlet of drains, of which you speak, is not uncommon. It is generally owing to the laying of badly burnt tile, by inexperienced workmen. Where the brick tile discharge into an open drain, they are much exposed to the frost in winter, especially

if it is a dry season, and the flow of water is not constant. It would be better to furnish all these outlets with three or four lengths of the vitrified pipe used for sink drains.

Catching and Holding Hogs.—"T. E." of Carroll Co., Ill., sends us a drawing of a device for holding hogs while "taming" them. It is an oak board, cut so as to form a substantial ring, with two handles on opposite sides. This is to be put over the hog's nose while the snout is operated upon. We can show

him a "trick" worth two of that. Take a piece of three-quarter inch oak board, plane it smooth, and cut out a piece like the one shown in the engraving, which should be about five inches long. Bore holes in the ends, four inches from center to center. They must be big enough for a stout cord to run easily in. Pass such a cord through as shown, and make a knot at one end that cannot draw through. Throw down a little corn and lay the hog thus formed around it; then when the hog comes up to eat, pull, and catch him back of the tusks. Pass the free end of the rope through a hole in the fence post, and pull the animal up to it. He will be held firmly and you may operate at your leisure. The chief use of the piece of board is to enable you to cast the animal loose instantly.

Refrigerators for the Farm-house.—"D. N. G." White Plains.—They will pay for their cost every season and are a very great luxury, especially if you have an ice pitcher for drinking-water. A good refrigerator can be bought for from \$10 to \$20, but you can make one for half the price that will last a dozen years or more. All the material wanted is a few pine boards, nails, a pair of butts, and some saw-dust or charcoal. A good refrigerator is simply a box within a box, the walls about 4 inches apart, and the space filled with some non-conductor. A few pounds of ice daily will keep all meats, vegetables, and fruits, in the best condition, and give you cold water to drink besides.

Women Farmers.—Mrs. T. L. Lord. It may be true that women have not all the facilities for a practical agricultural education that men have. But they are getting bravely over these disabilities, at least in the West. The Iowa Agricultural College, just organized, admits young women to all its privileges. All the other colleges in that State, including the University, have a similar provision. The Kaosa Agricultural College also admits women. There are not a few instances of women, left widows, who have taken their husbands' places and managed them with signal success. It would be fair to state also, that other women, in similar circumstances, have quite as signally failed. Some women, as well as some men, have a decided taste for business, and would manage any thing well. If such affect farming, there is nothing in public sentiment, either East or West, to forbid their success. The best cultivators of the other sex do not necessarily handle the hoe or guide the plow.

When to Cut Timber.—"Subscriber," Uniontown, Pa. In the spring the trees are full of watery sap, as is well known by common observation. Maple sap flows freely in March and April; grape vines bleed if cut until the foliage comes out. Apple trees bleed if pruned in April or before the blossoms fall. After a while the sap of most trees becomes inspissated or thickened, containing less water, and the bleeding does not occur. If timber be cut early, it is clear that it must contain considerable water, and when the water dries out of it, it will be left porous; and if it be cut later, when the sap is thick, it will be less porous. Throughout the season the sap is continually depositing matter in the wood, as well as in the more obviously growing parts of the tree, and this matter still further fills the pores, towards the close of the growing season, so that the wood is much more solid in the autumn than in the spring. A portion of the materials which fill the pores of the wood in the course of the winter is rendered soluble, and is dissolved by the sap when the new flow commences in the spring. Hence on general principles, it is best to cut wood in the autumn, for building purposes or for fencing. The differences in kind of timber, location, etc., with the inaccuracies of "practical" men as observers, give rise to different views, but it takes on-and-off proof to convince us that the view based on the best reason is not the best view.

Horses of All Work—The Percheron.

Real work-horses can hardly be said to be abundant in the United States. We have horses which do a great deal of hard work, but, not being made for it and adapted to it, they suffer under what should be light labor for them.

In the great cities, where they are an absolute necessity, we find fine specimens of heavy draft horses. There are a few districts whence a small number of good to large-sized horses are annually drawn, adapted to hard labor. A smaller race of real workers comes from Canada—admirable horses, of pony size and build, heavy for their size, strong for their weight, enduring as strong, kind, intelligent, tough, willing, good limbed, hard hoofed, profusely clothed with a full curly coat, and an abundant mane and tail. This is the "Kanuck," or French Canadian, whose progenitors came from Normandy. The true Norman horse is a larger and heavier animal, of somewhat similar style; but here, climate, food, and careless breeding, have, no doubt, wrought the change we see. The Kanuck, good as he is for work, can never be regarded as "of all work," for certainly the size of the breed precludes its being used for heavy draft.

Our people have become familiar with that grand race of French draft horses through the pictures of the most gifted of horse painters, Rosa Bonheur, and the engravings of them. Travellers see and wonder at horses, of ordinary size, measured by hands, in the streets of Paris, a pair of which will take a heavy omnibus, crowded with passengers, and trot off with it with apparently untiring ease, as if rejoicing in an opportunity to exert their great strength. A friend assures us, he saw last season, in France, a pair of Percheron horses trot a mile in a few seconds more than four minutes and a half, drawing an omnibus with twelve adult passengers. These horses come from the ancient districts of Perche, Britany, Normandy, and the country immediately adjacent. The Percherons have been most carefully bred, and probably originally were of the best blood. Without a doubt, the

breed originated during and after the time of the crusades, by crossing Arabian and Turkish and Andalusian stallions with the heavy Norman mares, and the value of the horses of different districts, it is said, clearly indicates at the present day, where the most free use was made of this Oriental blood. This is the stock from

this work, of a stallion and a mare, both the property of Mr. W. T. Walters, of Baltimore.

The stallion "*Hercules*," (fig. 1,) bred by M. Bigot, of Meniere, is a dapple gray, over 16½ hands high, and four years old. He is of the heavy-draft class of Percherons, of good form, fine, precise, and quick action, and good style.

His sire is "Monitor," and his dam has won several prizes as a breeding mare, and considerable celebrity as a trotter at the Perche races. We are glad to learn that his owner has resolved to wait his full maturity, before putting him to service. The mare "*Alene*," (fig. 2,) is a model of the Percheron Post or Omnibus horse. She is 15½ hands high, of a dapple gray color, of stylish and rapid action, and has considerable speed as a trotter. These horses, as indeed all of their race, that have come to this country, so far as we know, have been injured to labor from

the age of two years, and are in consequence thoroughly kind and manageable in harness.

Most of the horse breeders in this country, who have aimed at making a reputation for themselves or their studs, have raised either thoroughbred race-horses, or bred simply for speed as trotters. If the stock failed of distinction on the turf, they made useful saddle beasts, or pleasant, fast-trotting light carriage or business horses. They are not bred for labor, and have not the strength, endurance, nor temper for it. The Conestoga horse of the Pennsylvania Germans is adapted to heavy draft, and to that only. He is a work-horse indeed, but as far from being a horse of all work as possible. The walk is his natural gait, and, though there are exceptions, a trot seems as if it would shake him all to pieces. This is not such a draft-breed as we want. Its crosses with thoroughbreds make

within itself, and without recourse to warm blood, that is, Arabian or English thoroughbred.

The Publishers of the *Agriculturist* have recently issued a neat volume on "The Percheron Horse." It is a translation of the report of Mr. Charles Du Huys to the French Government, and it is well worthy the perusal of all horse breeders. We introduce two engravings from

fine, stylish heavy horses, but not hardly, and apt to be vicious; those with the Morgans, Canadians, and other light, cold-blooded breeds are not uniformly well proportioned, and give disappointment. The recent importations of Percherons, and the interest manifested in this wonderful breed of "all-work" horses, bids fair to make before long a great change in the charac-

Fig. 1.—IMPORTED PERCHERON STALLION "HERCULES," AT FOUR YEARS OLD.

Fig. 2.—IMPORTED PERCHERON MARE "ALENE."

ter of the farm and team horses of the United States; and this change, we doubt not, will eventually affect, directly or indirectly, our entire stock of *useful* or laboring, as distinguished from pleasure or light driving horses.

Walks and Talks on the Farm—No. 56.

A few weeks ago an Ohio subscriber of the *Agriculturist* wrote me in regard to the best time to plow under clover for manure. I wrote him that I had little practical experience in the matter, but theoretically the best time was a week or ten days earlier than it should be cut for hay. Dr. Voelcker's investigations [Journal of the Royal Agricultural Society, Vol. 3, Part 1, 1867] indicate that when clover bursts into flower there is no further accumulation of nitrogen, but that, on the other hand, there is a rapid formation of sugar and other nutritious carbonaceous substances. To cut clover for hay, therefore, as soon as it bursts into flower, would be a wasteful practice, but it is just the time to plow it under. We get no more nitrogen by allowing it to grow longer; and the more succulent it is, the more rapidly will it ferment and decay in the ground. I wrote to Mr. Geddes, one of the earliest and most enthusiastic advocates of clover, requesting his opinion on the point. In reply he said: "Plow under the clover when it is at full growth. But your question can much better be answered at the end of a long, free talk, which can best be had here. I have many times asked you to come here, not to see fine farming, for we have none to show, but to see land that has been used to test the effects of clover for nearly 70 years. On the ground, I could talk to a willing auditor long, if not wisely. I am getting tired of being misunderstood, and of having my statements doubted when I talk about clover as the great renovator of land. You preach agricultural truth, and the facts you would gather in this neighborhood are worth your knowing, and worth giving to the world. So come here and gather some facts about clover. All that I shall try to prove to you is, that the fact that clover and plaster are by far the cheapest manures that can be had for our lands has been demonstrated by many farmers beyond a doubt—so much cheaper than barn-yard manure that the mere loading of and spreading costs more than the plaster and clover. Do not quote me as saying this, but come and see the farms hereabouts and talk with our farmers."

Of course I went, and had a capital time. Mr. Geddes has a magnificent farm of about 400 acres, some four miles from Syracuse. It is in high condition, and is continually improving, and this is due to growing large and frequent crops of clover, and to good, deep plowing, and clean and thorough culture.

We drove round among the farmers. "Here is a man," said Mr. G., "who run in debt \$45 per acre for his farm. He has educated his family, paid off his debt, and reports his net profits at from \$2,000 to \$2,500 a year on a farm of 90 acres; and this is due to clover. You see he is building a new barn, and that does not look as though his land was running down under the system." The next farmer we came to was also putting up a new barn, and another farmer was enlarging an old one. "Now, these farmers have never paid a dollar for manure of any kind except plaster, and their lands certainly do not deteriorate."

From Syracuse I went to Geneva, to see our old friend John Johnston. "Why did you not

tell me you were coming?" he said. "I would have met you at the cars. But I am right glad to see you. I want to show you my wheat, where I put on 250 lbs. of guano per acre last fall. People here don't know that I used it, and you must not mention it. It is grand."

I do not know that I ever saw a finer piece of wheat. It is the Diehl variety, sown 14th September, at the rate of 1½ bushels per acre. It is quite thick enough. One breadth of the drill was sown at the rate of 2 bushels per acre. This is earlier, "but," said Mr. J., "the other will have larger heads and will yield more." After examining the wheat we went to look at the piles of muck and manure in the barn-yard, and from these to a splendid crop of timothy. "It will go 2½ tons of hay per acre," said Mr. J., "and now look at this adjoining field. It is just as good land naturally, and there is merely a fence between, and yet the grass and clover are so poor as hardly to be worth cutting."

"What makes the difference?" I asked.

Mr. Johnston, emphatically, "Manure."

The poor field did not belong to him.

John Johnston's farm was originally a cold, wet, clayey soil. Geo. Geddes' did not need draining, or very little of it. Of course, land that needs draining is richer, after it is drained, than land that is naturally drained. And though Mr. Johnston was always a good farmer, yet he says he "never made money until he commenced to drain." The accumulated fertility in the land could then be made available by good tillage, and from that day to this his land has been growing richer and richer. And, in fact, the same is true of Mr. Geddes' farm. It is richer land to-day than when first plowed. And yet there is one field that for seventy years has had no manure applied to it, except plaster. How is this to be explained? Mr. Geddes would say it was due to clover and plaster. But this does not fully satisfy those who claim (and truly) that "always taking out of the meal tub and never putting in, soon comes to the bottom." The clover can add nothing to the land, that it did not get from the soil, except organic matter obtained from the atmosphere, and the plaster furnishes little or nothing except lime and sulphuric acid. There are all the other ingredients of plant-food to be accounted for—phosphoric acid, potash, soda, magnesia, etc. A crop of clover, or corn, or wheat, or barley, or oats, will not come to perfection unless every one of these elements is present in the soil in an available condition. Mr. Geddes has not furnished a single ounce of any one of them. Where do they come from? *From the soil itself.* There is probably enough of these elements in the soil to last ten thousand years; and if we return to the soil all the straw, chaff, and bran, and sell nothing but fine flour, meat, butter, etc., there is probably enough to last a million years, and you and I need not trouble ourselves with speculations as to what will happen after that time. Nearly all our soils are practically inexhaustible. But of course these elements are not in an available condition. If they were, the rains would wash them all into the ocean. They are rendered available by a kind of fermentation. A manure heap packed as hard and solid as a rock would not decay; but break it up, make it fine, turn it occasionally so as to expose it to the atmosphere, and with the proper degree of moisture and heat it will ferment rapidly, and all its elements will soon become available food for plants. Nothing has been created by the process. It was all there. We have simply made it *available*. So it is with the soil. Break it up, make it fine, turn it oc-

asionally, expose it to the atmosphere, and the elements it contains become available.

I do not think that Mr. Geddes' land is any better, naturally, than yours or mine. We can all raise fair crops by cultivating the land thoroughly, and by never allowing a weed to grow. On Mr. Lawes' experimental wheat field the plot that has never received a particle of manure produces *every year* an average of about 15 bushels per acre. And the whole crop is removed—grain, straw, and chaff. Nothing is returned. And that the land is not remarkably rich is evident from the fact that some of the farms in the neighborhood produce, under the ordinary system of management, but little more wheat, once in four or five years, than is raised *every year* on this experimental plot without manure of any kind.

Why? Because these farmers do not half work their land, and the manure they make is little better than rotten straw. Mr. Lawes' wheat field is plowed twice every year, and when I was there the crop was hand-hoeed two or three times in the spring. Not a weed is suffered to grow. And this is all there is to it.

Now, of course, instead of raising 15 bushels of wheat every year it is a good deal better to raise a crop of 30 bushels every other year, and still better to raise 45 bushels every third year. And it is here that clover comes to our aid. It will enable us to do this very thing, and the land runs no greater risk of exhaustion than Mr. Lawes' unmanured wheat crop.

Pearl the butcher has been urging me for some time to raise early lambs for market. I told him that I thought of buying a thoroughbred South Down ram this fall, and picking out a lot of large Merino ewes to cross with him. "Don't you do it," he replied; "get a Leicester. The Leicester lambs are far better." "Is it not too violent a cross?" I asked. "Not at all. Mr. A. got a Leicester from Canada and crossed him with common Merino ewes, and had great luck. I don't believe he lost a single lamb, and they were splendid. They were the best I ever killed. There is nothing will pay you so well. Mr. B. did the same thing with a South Down, and he had no end of trouble in lambing. The heads are so large; and after all, the lambs were nothing like as good as the grade Leicesters. You will miss it if you get a South Down."

I wrote to Mr. Samuel Thorne, who has had several years' experience in raising grade South Down lambs for the butcher, asking his opinion on the point. He replies: "My own experience does not agree with that of Pearl. I have had many South Down and grade South Down lambs, and never, to my knowledge, lost one owing to the size of the head in lambing. As you know, the South Down has by no means a large head. Some of the other Downs have. I fancy Mr. P. has confounded the breeds. In using a Hampshire Down ram one season we had a great deal of trouble, and some loss from this cause. I never before heard any complaints of grade Downs not 'dying well'; on the contrary, the New York butchers, as far as my acquaintance extends, prefer them to any other."

I think Mr. Thorne hit it exactly, and that the ram used by Mr. B. was a Hampshire Down. When at Geneva last week, I saw a fine lot of grade South Down lambs raised by Mr. Swan, from common Merino ewes, crossed with a thoroughbred South Down, and he said he had had no trouble with them. On the contrary, he was delighted with the cross. They had all the marks and the general appearance of the South Down.

Mr. Thorne says he has no doubt that "any of the improved mutton breeds, crossed with common Merino ewes, will produce lambs that will pay a handsome profit." His plan is "to buy good, strong ewes in the latter part of August, selecting those that have the appearance of being good milkers. They are coupled the first of September, so as to bring the lambs in February. The ewes are kept on good hay during the winter, and as they near the time of lambing, one feed of roots a day is given. After lambing they are removed from the flock, the supply of roots increased, and bran mash and some grain added. The object now is to create as great a flow of milk as possible. The lambs soon show a disposition to eat, and a place is then set apart for them where bruised oats and cracked old-cake, with the best clover hay, are given ad libitum. If the lambs do well they are all sold and delivered by the 1st of June, and the ewes then have the summer in which to get ready for the butcher in the fall. Near any city or large town where early lambs command an extra price, there can be no doubt of the profit to be made by raising them. As soon as the lambs reach 60 lbs. they may be sent off. Mine usually brought me from \$5 to \$8 each. I paid from \$2.50 to \$4.50 for the ewes, and sold them fat the next fall for from \$5 to \$7, and I had the fleece besides."

This looks like a profitable business, and as June is rather a dry time financially on the farm, the money from the lambs would be very convenient to pay the laborers for hoeing.

I have just returned from a visit to the Michigan Agricultural College at Lansing. It is doing a great work, not only in educating the students, but in making experiments. Dr. Miles, the Professor of Agriculture, was made for the position, and has accomplished wonders. The whole farm is admirably managed, and does great credit to the students, who perform nearly all the labor. During the morning they attend to their various studies. President Albot took me into the rooms where they were reciting, and a finer set of young men I never saw together. Most of them are farmers' sons. In the afternoon they put on a working suit, and for three hours are employed on the farm, or in the garden or tool-house. They are allowed from 6c. to 7½c. per hour. Some were hoeing corn; others, pulling out stumps with a machine; others were helping the sheep-shearers, tying up the wool, weighing the fleeces of the different breeds and their grades, and entering the weights in a book, with appropriate remarks in regard to length of staple, fineness, etc. One active young fellow was pushing a hand-garden cultivator through the cleanest and best crop of onions I ever saw growing; another was cultivating a young apple orchard; others were in the hay field where a new mower had just started. And the foreman told us that, before working hours, there had been quite an animated discussion as to whether the clover was ripe enough to cut; the freshmen, as a rule, taking the ground that it was too green, and the seniors that while there might not be as much bulk, the hay would be sweeter and more nutritious than if allowed to stand longer. Another question discussed was whether it was or was not best to use a tedding machine in making clover hay. A horse was attached to a tedder, and though the clover was hardly wilted at all, and was very heavy, worked to perfection, and an opportunity was thus afforded of testing the matter. A two-horse cultivator was at work in the corn field, the young man riding and steer-

ing. It was light work, and though the day was very hot, neither man nor horse needed to stop to rest every few bouts, as is so generally the case with an old-fashioned one-horse "corn scratcher." Now, you need not tell me that a young man will not learn a good deal at such an institution. Leaving science entirely out of the question, what he sees of good cultivation, good implements and machines, improved breeds of cattle, and sheep, and pigs, will go far towards making him a good farmer. Success to the American Agricultural Colleges, and may the day soon come (and it is coming very fast), when trained minds and skilled hands shall banish drudgery from American farms. Mark you, I am no advocate for ease and indolence. I believe in work; but I want work to tell. As I came home I saw more than one case where a man was cultivating corn, with a boy riding the horse. The poor horse doubtless wished the boy was at college. Near Detroit I saw two men cultivating potatoes, one leading the horse, and the other holding the cultivator!

Prof. Miles has been making some experiments in feeding grade Merino sheep, grade South Downs, and grade Cotswolds. The Merinos and Cotswolds were lambs, and the South Downs, yearlings. The former two, therefore, give results that are strictly comparative; the latter, not. These grade lambs were from common Merino ewes crossed in the one case with a thoroughbred Vermont Merino ram, and in the other with a thoroughbred Cotswold. "What do you mean," I asked Prof. Miles, "by common Merino ewes?" "The ordinary kind of sheep in this section, such sheep as could have been bought here last fall for 75c. to \$1 a head." The lambs were shut up in pens Dec. 13, and were fed corn and clover hay for 23 weeks, or till the 15th of May. At the commencement of the experiment the two grade Merino lambs weighed 125½ lbs., (one 70 lbs.; the other 55½ lbs.) The two grade Cotswolds weighed 158 lbs., (one 86 lbs.; the other 72 lbs.)

The Merinos eat 325 lbs. of hay, and 249 lbs. of corn, and gained 36½ lbs. The Cotswolds eat 398 lbs. of hay, and 399 lbs. of corn, and gained 67½ lbs. A little figuring will show that it took 1,572 lbs. of hay and corn to produce 100 lbs. of increase with the Merinos, and only 1,136 lbs. with the Cotswolds.

Prof. Miles has figured up the amount of food consumed for each 100 lbs. of live weight. In the 22 weeks, the grade Merinos, for 100 lbs. of live weight, eat 231.81 lbs. of hay, and 168.13 lbs. of corn, and the grade Cotswolds, 212.82 lbs. of hay, and 186.43 lbs. of corn. The Cotswolds eat more corn and less hay in proportion to live weight than the Merinos; but the total amount of food consumed in proportion to live weight is almost identical. Thus the Merinos consumed 399.96 lbs., and the Cotswolds 399.25 lbs.; or a little over 2½ lbs. of food per day for each 100 lbs. of live weight.

It is very evident, therefore, that for the production of mutton the grade Cotswolds are far superior to the Merinos. It is equally clear, too, that by the use of thoroughbred Cotswold or South Down rams we can soon get a very useful class of mutton sheep from common Merino flocks. And at present the wool from these grade Cotswolds is worth full as much as ordinary Merino, and a good deal more than that of fleeces which are more than half yolk.

Mr. Geddes writes me: "I am at a loss to understand what you mean when you say (*May Agriculturist*, page 179), that a ton of straw will make in the spring of the year four tons of

so-called manure. If you had said that four tons of straw would make one ton of manure, I should have thought nothing of it. But how you can turn one ton of straw into four tons of anything that anybody will call manure I do not see. In a conversation I had with Hon. Lewis F. Allen, of Black Rock, more than a year ago, he told me he had enquired of the man who furnished hay for feeding cattle at the Central Yards in Buffalo, as to the loads of manure he sold, and though I cannot now say the exact quantity to a ton of hay, I remember that it was very little—far less than I had before supposed. Mr. Allen could give some important information on this point. Please explain this straw manure matter."

Boussingault, the great French chemist-farmer, repeatedly analysed the manure from his barn-yard. "The animals which had produced this dung were 30 horses, 30 oxen, and from 10 to 20 pigs. The absolute quantity of moisture was ascertained by first drying in the air a considerable weight of dung, and after pounding, continuing and completing the drying of a given quantity." No one can doubt the accuracy of the results. The dung made in the

Winter of 1857-8, contained 79.6 per cent of water.

" " 1858-9, " 77.8 " " " "

Autumn of 1859, " 80.4 " " " "

Fresh solid corn dung contains, according to the same authority, 90 per cent of water.

I have frequently seen manure drawn out in the spring that had not been decomposed at all, and with more or less snow among it, and with water dripping from the wagon while it was being loaded. It was, in fact, straw saturated with water, and discolored by the droppings of animals. Now, how much of such manure would a ton of dry straw make? If we should take 20 lbs. of straw, trample it down, and from time to time sprinkle it with water and snow till we had got on 80 lbs.; and then put on 20 lbs. more straw, and 80 lbs. more water, and keep on until we had used up a ton of straw, how much "so-called manure" should we have to draw out?

20 lbs. of straw and 80 lbs. water = 100 lbs. so-called manure.

2,000 lbs. of straw and 8,000 lbs. water = 10,000 lbs. so-called manure.

In other words, we get 5 tons of such manure from one ton of straw. This is, perhaps, an extreme case, but there can be little doubt that a ton of straw trampled down by cattle and sheep in an open barn-yard, exposed to snow and rain, would weigh four tons when drawn out wet in the spring.

Yes, it is quite an argument in favor of manure cellars. I have always had a prejudice against them—probably because the first one I saw was badly managed. There is, however, no necessity, even in an ordinary open barn-yard, with more or less sheds and stables, of having so much water in the manure when drawn out. The real point of my remarks which so surprised Mr. Geddes was this: We have to draw out so much water with our manure, under any circumstances, that we should try to have it as rich as possible. It is certainly true that if the manure from a ton of straw is worth \$3.00, that from a ton of clover hay is worth \$10.00. And it costs no more to draw out and spread the one than the other. I have never yet found a farmer who would believe that a ton of clover hay rotted down in the barn-yard would make three or four tons of manure; but he would readily assent to the proposition that it took four or five tons of

green clover to make a ton of hay; and that if these four or five tons of green clover were rotted in the yard, it would make three or four tons of manure. And yet the only difference between the green clover and the hay is that the latter has lost some sixty or seventy per cent of water in curing. Add that amount of water to the hay, and it will make just as much manure as the green clover from which the hay was made. This subject is an important one, and should be discussed till it is understood.

A BUCKEYE BOY ON WHEAT GROWING.—W. G. Phelps, Granger Co., Ohio, sends us his father's method of cultivating wheat. We always like to hear from the boys, especially when they write as briefly and as much to the point as the following: "Our land is not considered favorable for wheat. [You should have said why.] We use meadows that the grass has failed on, breaking up about the middle of August. Then roll and put on 10 or 12 loads of manure per acre, and drag once, twice in a place. Then sow the wheat, and drag once. Then sow Timothy seed, and all the ashes and hen manure we have on the farm. Then drag once and roll. This leaves the land in good condition for mowing, and we only lose one hay crop. By putting the manure on the surface we got 23 bushels of wheat per acre last year, while our neighbors who plow it under, and do not roll their land, only got 10 or 12 bushels, and our meadows yield better for this treatment. In breaking up, we plow round the field so as to leave it as level as possible." Where land is clean, and the object is to get it back into grass as soon as possible, as in the dairy districts, we presume this plan is not as objectionable as it would be in the wheat growing sections. Let us hear from the farmers' boys oftener.

Stacking Hay with Horse Forks.

Stacking derricks are awkward things at best, and not a little difficult to set up and manage. The simple shears which we described last year, though they will do the work, are not nearly so convenient as those we now illustrate from the descriptions and inkings of Ira B. Smith,

Fig. 1.—STACKING—TAKING THE "GRIP."

of Holden(?). Any horse-fork may have a pulley attached to the top of it. Mr. Smith uses two 40-foot poles and two 30-foot ones. They are set up, forming two shears, one on each side or end of the stack, allowing room for the loads on the side of the taller shears. They are braced by a single strong rope. Fig. 1 shows the posi-

tion of the fork and rope connected with it when about to take a "grip" of hay. The rope is affixed to the top of the lower shears, then passes through the pulley block upon the fork, then through blocks at the top of the tall shears, and at the foot of one of the poles, and is attached to the horse. When the horse starts, the fork with its load rises nearly perpendicularly until the rope is taut; when it slides down the inclined plane made by the rope stretched between the shears, and as it comes directly over where the hay is wanted (see fig. 2), the trip cord is pulled by the man on the load, the hay drops. When the horse backs, the

Fig. 2.—STACKING—DROPPING THE FORKFUL.

fork descends again to its starting point. Mr. Smith says: "I have stacked my hay for the last two years with it, and like this arrangement very well. It cost me only about five dollars for pole, and the cutting of a few poles, and does the work as well as any derrick I ever saw."

Barn Cellars for Manure Making.

Animal manures, solid and liquid, are not only valuable to the farmer for the ingredients they contain, considered as food for his crops, but on many farms their value is perhaps chiefly due to the fermentation which they incite in other substances. Thus, very much on the principle of yeast in a batch of dough, a small quantity of animal droppings will make good manure of a great quantity of otherwise inert vegetable matter. Peat, muck, salt-mud, sods, swamp grass, weeds, chip-dirt, saw-dust, and similar substances, are very commonly used to increase the manure pile, but with the impression that they add bulk rather than much value—that they act as absorbents of urine and ammonia, and so save, rather than increase the value of

the manure. This is a grave error, as practice shows. The number of cattle and the quality of their feed are no so important as the manner in which their manure is treated, and the place where it is kept. Exposed in the open yard it is subjected to all unfavorable influences possible. The rains wash and soak it; the sun dries it;

its own fermentation burns it up by internal heat. If water comes from external sources, from the eaves of the barns or from higher ground, as is the case on thousands of pretty good farms, it seems almost a wonder that there is any virtue left. The manure ought to be covered. Sheds are inconvenient and cost labor to move the manure into them, and they rapidly fill up, and the heaps are soon too bulky, too much in the way, and besides are exposed to the action of sun and wind, more or less. A well-arranged barn cellar obviates every difficulty. The manure is dropped from the stock floor directly into it; materials with which to mix it

are easily added through trapdoors or shutters; the liquid manure is from the outset mingled with the compost; the whole is easily spread, worked over, and equalized; it is shielded from the influences of the weather; its fermentation, which might be injurious, is easily controlled; and the system is applicable on every farm.

Absorbents.—The recent promulgation of the fact that dried soil is one of the most efficient absorbents, deodorizers, and disinfectants, is not essentially new. John Smith, late of Holliston, Mass., a prosperous old farmer, asserted twenty years ago, that he could keep his horse in first-rate condition

through the year on hay and grain, and sell the manure made by simply mixing *dry loam* with the excrements, for enough to pay the whole cost of keeping. His plan was simply to gather a great quantity of loam in August or September, when perfectly dry, so that it would not freeze in winter, and store it in a bin contiguous to the horse stall, and keep a large supply—say six inches or more deep—constantly under the horse, removing all that was damp, morning and night, to the cellar below, and replacing it with dry. Besides the saving in manure, this plan is excellent, as it benefits the horses' feet.

Any common loam, even a sandy soil, makes an excellent material to mix with manure in a barn cellar, and either this, (raked over until dry, run through a coal screen, and exposed in a thin layer on a floor to the sun for an hour or two,) or fine dry peat or muck, ought to be conveniently stored under cover in abundant quantity to last all winter, using from a peck to half a bushel to each animal each day on an average. One side of the cellar may be used to store it in, and there is no better month than August to get in a good supply to last all winter.

Ventilation is most important in every good barn; and it is especially necessary when animals stand over their own droppings. These, however, when properly mixed with a dry material, of which dry powdery peat, muck, or loam, constitutes a notable quantity, will emit no bad gases or odors. This fact does not in the least lessen the necessity for abundant provision for pure air for the stock.

Decay of Timbers.—It is almost impossible to have cattle stand over a cellar, or on a floor of any kind, and not to have the timbers wet with the liquid manure. This tends to rot them; but so slowly does the decay progress, that we have heard persons soberly express the belief that the effect was rather preservative than otherwise. The amount of unavoidable wetting is very slight.

Carelessness in the management of a barn cellar is productive of three serious evils—no proportionate increase in the quantity and value of the manure, a loss through unchecked fermentation of the manure itself, and damage to the cattle and fodder kept above the reeking mass of decaying matter. Care is naturally and easily given, and demands less labor than the clearing out of the old-fashioned stables.

Hogs in Barn Cellars.—While we advocate barn cellars as the best means of increasing the quantity and value of manure, it is no considerable advantage that hogs may be kept in them, and add greatly to the value of the compost. They are perfectly healthy if the cellar is kept properly supplied with absorbents, and are ordinarily much cleaner than when confined in small pens more or less exposed to the weather.

HOW THE TRACE WAS MENDED.—The familiar story of Columbus and the egg has many

THE MENDED TRACE.

an application in every day life. How many things are absurdly simple—"easy enough if you only think of it,"—yet not thought of at the right time! John H. Simonson, of Brookvale, L. I., was unfortunate enough to have the tug-eye tear out of one of his leathern traces when far from home with a heavy load. If he had cut a hole in the trace for the hook it would probably have torn out. He did better. Shifting the tug, end for end, he put the eye end in the buckle, and in the more flexible buckle end cut a hole and slit, as shown in the engraving, slipped the eye in, and went on with a strong trace. But very little strain is thus brought upon the leather at the hole, on account of the two bearings the trace has upon the bars.

A Grass Doctor—Scuffle Hoes.

A letter too long for a "basket" item, too good to make several of, and too spicy to keep to ourselves, if it be "personal," comes from Down East, and from a lover of grass, and greens, and clean farming. He writes:

"Well—I learned something in L—. Its climate is not suited to pine-apples. Some very nice people are raising Durham cattle in that section. Rob themselves of milk, and lie awake o' nights to raise bulls and heifers. No wonder beef is high. There might be some fun in raising grass there if one did not feel the need of spending ten times the value of the land in draining. I have thought of offering my services to the public as a grass doctor. Why not? Our present science, or no-science, teaches us if we want a fine sod to use 1 per cent of the seed which makes it, smothered with 99 per cent of something we don't want, (and which, luckily, is short-lived,) and wait five or ten years for the natives to come in the good old way of nature. How much better the sod looks where cattle run in the street, by the roadside, than in our "improved" meadows! Send me somebody who has his money yet to spend, and wants to improve old pastures, meadows, and fields—some one who has not his hands

more than full trying to raise pine-apples in the open air! Yes—I think I ought to be a grass doctor. Put my card in the *Agriculturist*, if you think it best, and send me the bill.

I am exercised on the subject of Scuffle Hoes, and think of coming down to see you, and bring the implements, and make a show at a public trial. Have you got some roots just coming up—or anything weedy? If I had the hoes and could get at the people that need them, and by some electric process flash into their minds what I know of the good of 'em, I could sell a million within a month. No patent hoe either. The people's own—the old pattern a little improved, and well handled. With it, weed-killing becomes a pastime like billiards. Set the day for me to come down. I am trying to get a few tools made up North, in the hoe and handle country. Who knows but I can divide the affections of the nation with General Grant! Win or no win he'll go out of fashion in time; but I think Scuffle Hoes more durable. Say the word. I don't wish to wander about New York in summer, but if you want to see me kill weeds, or hear me talk about grass, I'll give you a visit soon. My diet is bread and milk. If you have a calf that takes all the milk of three cows I shan't come. That is a species of calf-worship worse than that of the Hebrews."

Perfectly Safe Whiffletrees.

It is his own self-control that renders a horse manageable. When anything happens to disturb this, and a horse becomes frightened, thoroughly frightened, in his frantic struggles or dashes he may quickly ruin himself, destroy precious lives, and much property. One of the most frequent causes of fright to horses is the breaking or displacement of some part of the harness. Hence every careful man is always sure that nothing about it can possibly go wrong. A correspondent of the *Agriculturist*, saved, providentially, from imminent danger, caused by the trace becoming unhooked from the whiffletree, asks us what style of attachment of the trace to the whiffletree is perfectly secure? There is very little danger of most of the common fastenings unhooking, yet we think that all those which require that the eye should be held simply in an unusual position in order

Fig. 1.

to be inserted in the hook, are liable to the danger of having the eye accidentally rattled out the same way. The following engravings, figs. 1 and 2, show a combination of hook and spring which holds the eye until it is unhooked by human hands. Fig. 1 is the simplest, strongest, and most convenient—in fact, the only one we have ever used or seen; still we can imagine an accidental pressure to be brought upon the trace eye in such a way as to cause it to press down the spring and slip out, as we do in unfastening it.

Such a case can hardly be imagined, however, with reference to the arrangement shown in fig. 2, for here the end of the spring being bent at a right angle, and sinking into a slot in the cap, makes it necessary to bend down the spring from outside the hook in order that the eye may be disengaged. The same end may be accomplished by a stiff spring.

Fig. 2.

How to Make Hogs Extra Fat.

Hogs well fed and kept clean will fatten rapidly. If true economy be consulted the grain will be ground and cooked. Hogs have good appetites and a powerful digestive apparatus. It is a well known fact that the appetite will

JEALOUSY AS A TONIC IN FATTENING HOGS.

usually fail long before the hog's ability to digest well is impaired by surfeiting. Though swine in thin flesh fatten very rapidly, fat hogs increase in weight slowly, often greatly to the disappointment of their feeders. This is due usually to the failure of the appetite, and in case we want hogs very fat, we seek to remedy the difficulty by varying the food and stimulating a desire to eat, in various ways, feeding little and often, in order to make the animals eat as much as possible. A good story was lately told us of several neighbors who year after year vied with one another in trying to produce the fattest hog, each taking a pig from the same litter, or in some way starting fair and square with pigs of the same age and size, and doing his best to make it as fat as possible before Christmas. One of the farmers invariably beat the others out and out, so thoroughly that his good luck could never be accounted for as accidental. The secret he kept to himself, but being watched by some one determined to find it out, the discovery was made that jealousy is a grand appetizer for hogs. First the pet monster was allowed to fill himself to his heart's content, and when his appetite was satiated, a half-starved shoat was let in to the pen by a side door. The fat one would at once begin to fight it off, and meanwhile, to gorge himself, simply to prevent the poor squealing victim of unsatisfied cravings getting any food. This was a daily programme, and the result was as stated. The fact is worth bearing in mind, for in preparing hogs for exhibition, or for some reason, we are often desirous of expediting the fattening process.

Peat and Muck as Fertilizers.

The season when the swamps are usually driest leads us to call attention to the muck mines. There has been a very great change in the use of peat and muck during the last twenty years, but it is still not half appreciated. Multitudes who have these mines upon their farms never work them. There is a great difference in the character of the peat and muck found in our swamps, but it is rare to find one that does not afford a fertilizer that will pay largely for carting and composting. A few bogs have been found containing soluble salts of iron (copperas or green vitriol), in such quantities as

to be injurious to vegetation, but even the peat dug from these bogs is readily corrected, and made valuable by composting with lime. Men who have once begun to tap the muck mines generally go in deeper every year, until the wants of their farms are fully supplied. The writer has derived so much benefit from the use of muck in his farming, that he has no doubt it is, to most farmers, the cheapest and best amendment of their soils. He would apply it in large quantities to all sandy and gravelly loams, and, when composted with other manures, to all soils under the plow. So rare is it to find poor or poisonous peat, that the presumption is, in every case, that a peat or muck swamp is a mine of wealth to the farm. We should not want to work land in any of the older States, that had not this source of improvement upon it or very near it. If the swamp has never been worked, it is easy to test it in a single season. Throw out a quantity of muck, and if, after the first winter, weeds grow freely in it, it is a good article. Rank weeds indicate luxuriant corn and potatoes. Or, take the weathered muck, and mix it with sand, and plant a few flower seeds in it. Or, better still, spread a few bushels of it upon the grass, and note the results. When you have found a good bed, work it largely, as if you had faith in it. If 500 cords are thrown out the present season, there will be use for the whole of it. It is of great advantage to have it dug, and drawn out upon hard land, aside from its improvement by exposure to the weather. It loses more than one-half of its weight in the water which drains from it, and this saves one-half the expense of cartage. Then it is always accessible, and a few loads can be put into the yards or stables, as wanted. It is ameliorated by exposure to the air, the rains, and the frost. The more frequently it is overhauled, the more rapidly it improves. If it is to lie upon the banks of the ditch or pit whence it is thrown out, boards should be put beneath it, to make the drainage thorough. Unless the peat is of very good quality, and in quite limited quantities, it is usually better not to dig more than six feet from the surface. There are several ways of using peat to advantage. Some varieties are so good that when weathered they can be applied directly to the land, as a top-dressing for grass, or be plowed in for food crops. But these are exceptions to the general rule. As absorbents are wanted, peat is often the most convenient article that can be used, and, applied in sufficient quantities, it prevents all loss of ammonia in the stables, sties, yards, sub-drains, and privies. It is a complete deodorizer, and could be profitably used for this purpose alone. Some have a gutter constructed at the rear of the stalls, and put about a bushel of muck in the gutter daily to each animal. This is thrown out every day, and mixed with the solid feces, and more muck is added to the heap of compost. Others keep a bed of peat, say 10 inches thick, constantly under the animals, bedding well with straw, and renewing the absorbent every ten days. The animal heat hastens decomposition, and we know of no way in which peat can be so rapidly transformed into a good fertilizer. Others have movable floors to the stables, and the muck is thrown into the pit beneath, which saves all the liquid manure. If the stables are in constant use, the muck should be renewed every six months, or oftener, if thoroughly saturated. It is also much used in making a compost with stable manures. A layer of peat one foot thick is placed upon the ground. The heap for convenience in working

should be not less than eight feet broad, four or five high, and of any desirable length. Upon the layer of peat put three inches of manure, then one foot of peat, and so on in alternate layers, until the heap is finished. It should lie in heap for two or three months, and be forked over twice. We have found a compost made in this way quite as effective as stable manure. Various other articles are used for composting with peat, such as night soil, Peruvian guano, ashes, lime, dead animals, factory wastes, etc. Every farmer should own Professor Johnson's little work on "Peat and Its Uses," where these matters are very fully discussed.

Tillage During the Growth of the Plant.

The stirring of the soil around cultivated plants is a very important part of husbandry. Just how much it will do for all our crops has never been satisfactorily determined by accurate experiments. If some have thought it was the one thing needful, and tried to prove it, their experiments have not made a very deep impression upon the public mind, for intelligent farmers keep right on making and applying manures at very great expense, showing that they have quite as much faith in manure as in tillage. Men are prone to ride hobbies, and tillage, perhaps, has been overestimated by a very few agricultural writers. We think the tendency now among our best farmers is towards a more thorough and frequent cultivation of crops, and their conviction is very strong that it pays as well as any other application of labor upon the farm. Our inventors have responded to this conviction, and given us improved tools to cheapen tillage. The hand-hoes and scarifiers have reached the last limit of lightness and convenience. We have a variety of harrows and cultivators for horses, which, in many parts of the country, have almost entirely superseded the hoe for field crops. These tools have greatly reduced the expense of cultivation, and made it more frequent and thorough. The first office of tillage is to destroy weeds. These grow very rapidly in summer, especially where the land is foul and rich, and unless subdued, damage the crop. They want the same nourishment as corn and potatoes, and, if neglected, will diminish the crop more than one-half, and make it cost more than it can be sold for. Many farmers lose money on their field crops from this neglect, and if they would make a careful estimate of the cost of labor bestowed upon a particular field, and compare it with the market value of the crop, they would see it. Tillage not only destroys weeds, but makes the soil ready to receive the full benefit of the rains, the dews, and the atmosphere. When the surface of the ground is disturbed by the hoe or cultivator, the particles are left loose, and drink in the rain and dew greedily. The air also circulates more freely in the soil among the roots of plants. Ammonia, in very small quantities, is brought down by the rains, and the roots of plants get the full benefit of it. Soon after cultivation, a thin crust forms over the soil, and the better the quality of the soil, the thicker this crust, and the more frequently it needs to be disturbed. Tillage is to a certain extent a substitute for rain as well as for manure. Every careful observer has had occasion to notice this in times of drouth. The curled corn leaves will expand under the influence of the cultivator and the hoe. Just how much cultivation will pay we may not be able to tell. But there can be no doubt that the crops would pay for much

more than they get. The practice is increasing rapidly in England for farmers to sow their wheat with drills, and cultivate it. Thus they get a largely increased yield. In fact, the average yield per acre is nearly twice the average crop that we get in this country, where wheat is almost never cultivated. Farmers who have the sulky cultivator sometimes cultivate their corn as many as six times, and get seventy or eighty bushels to the acre. They manure well, it is true, but they claim that their frequent cultivation pays as well as the manure, and we think they are right. The old-style farmers, who hoe their corn the third time, claim that the last cultivation is as profitable as the first and second. It pays not only in the larger yield, but in clean fields the next and following years. We have noticed in mechanics' gardens, kept scrupulously clean by an hour's work at morning and evening, much better crops than in farmers' gardens where there was plenty of manure, but much less cultivation. The man who hoed his cabbages every morning before breakfast carried the joke a little too far, perhaps, but he had a splendid crop. We are confident that once a week is none too often to put a cultivator between the rows of corn, until it gets too big for the operation. We should like to see an experiment tried on corn to show the difference in yield between twice cultivating or hoeing, which is the old-style treatment, and thorough cultivation six times, which some of our best farmers practice.

Medicating Animals.

Some of our domestic animals are removed almost as far from a state of nature as we are ourselves. Subjected to the influences of civilization, they are made liable to accidents and diseases which would never trouble them but for their association with man in his unnatural life. We may shield our animals from many ailments, by attending to their diet, the cleanliness of their quarters, to the purity of the air they breathe, to proper shoeing, yoking and harnessing, etc., but nevertheless they will occasionally become diseased, or injured, and need medical or surgical care. We are badly off for veterinary surgeons in this country, and in ninety-nine cases out of an hundred the owner must do something for his sick animal, or stand by and helplessly watch the progress of the disease. A physician of large practice and experience told the writer not long since, in deprecating the habit of people drugging themselves, and applying to apothecaries and physicians for medicine, not being satisfied unless medicine be given, that at times he felt almost as if it would be a blessing to humanity if all taking of drugs could cease, and both patients and physicians would be forced to prove the efficacy of good nursing and attention to diet and the general sanitary condition of the system. Another physician of great and good repute in New York City remarked if he could have his choice of hospitals in which to treat 100 patients sick with usual diseases, and could get a dry, sunny field, protected by a wood, and have canvas for shelter, he would much prefer the latter place, and felt confident he would report a much larger proportion of cures. If these are facts with relation to the human being, how much more important must it be for animals not to be injudiciously drugged, and confined indoors! Every farmer ought to know how to recognize early symptoms of disease or disordered functions in his animals, and be able to apply simple remedies. The best class of reme-

dies are such changes of diet as will produce the desired effects. For instance, raw roots will produce looseness of the bowels, and alway feverish tendencies in horses, cattle, sheep, and swine. So will fresh grass cut and fed with the dew on. Boiled fine wheaten flour porridge made with water for horses, that will not take milk, and with sweet milk for other animals, will produce the opposite effect. Other sanitary effects may be produced by the use of articles of food. And we have no doubt with care the list of effects produced by different kinds and mixtures of articles used as food, might be greatly extended, so that most ordinary ailments might be checked by early attention to diet and surroundings. In our own experience we have found that sick horses turned out into a woody pasture almost always got well, or improved greatly; that cows and young cattle let alone on a natural diet, with fresh water, air and salt, did better and got well quicker than if subjected to any guess-work treatment. However, a good dose of Epsom salts and ginger seems to be almost a specific for feverishness, ("horn ail," constipation, colics, clotty or red milk, etc., with cows, and it is well to hold this in reserve, in case a change of diet has no good effect. Sick chickens get well in a grassy run among angle worms and grasshoppers. Sheep that are snuffling and running down in close barn-yards will pick up wonderfully if they can get their noses into the hedge rows, or have a run in the woods or bush pastures. In the variety of herbage and twigs they find the best diet. Pining hogs will get well in a clover pasture, or on clover hay in winter. And they will improve much faster if they can live on nuts and roots, having the ability to use their snouts as was intended.

Possibilities in Dairying.

Very interesting facts were brought out at the last meeting of the Board of Agriculture in Connecticut, in regard to milk. One farmer, from a herd of twelve cows, produced 33,199 qts., or an average of 2,766 qts. per cow, which is over 8 qts. a day for a season of eleven months. His average price for milk was 4½ cts. per qt., which made \$131 for milk; and the calves brought \$4 each, which made the return for each cow \$135 per year. In the memorial presented to the New York Legislature by the State Agricultural Society, the number of cows in the State was put at 1,123,000, and their products in cheese at 48,548,289 lbs. = 242,741,445 qts.; products in butter at 103,097,280 lbs. = 1,030,972,800 qts.; products in milk sold, 84,000,000 qts.,—making 1,357,714,245 qts. 5 qts. of milk are reckoned for one pound of cheese, and 10 qts. for 1 lb. of butter. This, divided by the number of cows, would give 1,209 qts. as the average annual product per cow in the best dairy State in the Union. It is a fair statement to say, that there is a difference of more than one-half between the average product of cows in the State, and the product of the best milkers. At the meeting referred to, E. H. Hyde stated that he once had a Durham cow that produced 55 lbs. of milk, which made 2 lbs. 15 oz. of butter daily for thirty days in succession, and a Devon that made 24 lbs. a day. An Alderney cow was mentioned that produced 26½ lbs. of butter in 10 days. These facts, and a good many others that might be stated, show that there is great need of improvement among our dairy stock. It is quite possible to double the product of milk in a very few

years, without increasing the number of cows. A first step in this direction is to get a better race of milkers. Our best dairymen understand this, and are aiming at it. They get the best native milkers, and breed with a thoroughbred bull, from a good milking stock. The grades thus produced will generally be good milkers. Their offspring will usually be an improvement, and this may be expected for several generations. A distinct family of Short-horn grades has been produced in East Windsor, Connecticut, by this process, within the last thirty years. They are great milkers, and sell at very high prices. The importance of a thoroughbred bull, to secure good milkers, is now insisted upon by all intelligent breeders.

Of course, feeding has much to do with a large flow of milk. For three months in the year, in favorable seasons, a cow may produce nearly up to the limit of her capacity on grass. But after this, the grasses become less succulent, or short, and the milk falls off. The feed must be generous all through the season, and a cow is generally profitable in proportion to the amount of food she consumes. The pasture must be supplemented by green fodder, rye, corn, clover, and in the winter, by roots, grain, oil-cake, and other rich food. There may be a good deal of high feeding without damage to the constitution of the animal, and with decided benefit to the character of her progeny. Shelter, also, has an influence upon the productiveness of the herd. Cows fed at the stack, during the winter, will not give as much milk the following season as those fed in a comfortable barn, although they will consume a third more hay. Kind treatment and frequent feeding are also elements of success in the production of milk. Some dairymen, who produce milk for market in the winter, feed as many as six times in the course of the day, with a great variety of food, and keep water constantly in the manger. A good milker wants water every hour in the day, and she secretes milk much better for having it constantly before her. If this course of improvement be entered upon, more capital must be invested in manures, barns, provender, and stock, but there can be no doubt that the returns will be far more satisfactory.

Salt Mud as a Fertilizer.

Large quantities of mud accumulate in the bays and coves along the sea-shore, made up of the wash of rivers, of decayed manure, vegetation, and in many cases also, of animal remains, shell-fish, and very minute organisms. It is found in many places of great depth, and so soft that an animal would sink out of sight in it. It is very fine, and of great value as a fertilizer. Near the shores, this mud is laid bare at every low tide, and it might be easily secured by the use of wheelbarrows and planks. In deeper water, the eel grass strikes its roots into it, and the mud is pulled up in large quantities, with the eel grass rakes. Much of the virtue attributed to the grass, which is generally used by shore farmers, is doubtless due to this mud. More of the mud and less of the grass would be better policy. We have seen the mud applied as a dressing for corn and potatoes with the best results. It is an excellent top-dressing for grass, often doubling the crop the first season. An analysis of this article, made by Prof. Johnson, shows that the organic matter contains nearly 4½ per cent of nitrogen, or nearly double the amount found in good peat. The mud should be weathered a few months before it is applied. Summer is the best time to secure it.

Canada Thistles in the West.

Canada thistles have been discovered in the West, notwithstanding their existence has been doubted by some of our cotemporaries. The legislature of Iowa passed the following law in regard to them, at its last session: "That if any resident owner of any land in this State, after having been notified in writing of the presence of Canada thistles on his or her premises, shall permit them, or any part thereof, to blossom or mature, he or she shall be liable to a fine of five dollars and costs of collection, for each offence." True, they may not know the plant in that enterprising State, but it is just possible that there may have been some one in the legislature of sufficient botanical knowledge to save the body from the folly of passing a law against a foreign plant. A writer in the Journal of the New York State Agricultural Society mentions a farmer who has cut Canada thistles from the 15th to the 25th of August for the last four years, and thus destroyed them. The reason he gives for this is that at this season the stalks are hollow, and the rain and dew settle in them, and they rot to the roots. The experiment of cutting them at this season ought to be made. It will be enough for most farmers to learn that the practice is successful. The policy adopted by the State of Iowa is a good one, and ought to be adopted by all the States where this plant has made its appearance. The law also ought to hold railroad and other corporations, and the town authorities, responsible for the thistles growing out of private property.

The American Marten.

The Weasel family, to which the Marten belongs, includes several of the most voraciously carnivorous animals of the world,—among them those which the Marten most closely resembles, namely: the Mink, Weasel, Ermin, Sable, and Ferret, all of which produce beautiful and valuable furs. Were the Lions, Tigers, and Leopards, half so ferocious and voracious, the countries where they abound would be hardly habitable. The American Marten (*Mustela Americana*) is found in the United States, in Northern New England and New York, in Michigan, and the Lake Superior region, and westward, but it abounds in Canada, and northward, the fur bearing the name of Hudson-Bay Sable. The Marten measures about 17 inches to the tail, which is about 10 inches long; the fur is fine, of a reddish yellow or brown, clouded with black, the legs and tail shading from dark brown to nearly black. The throat and breast to the fore legs are yellowish. This species so closely resembles, both in appearance and habits, the Pine Marten (*Mustela Martes*), of Europe, that it has been regarded as identical. Its habits are very similar also, but it is not found so much in inhabited districts, and on this account we do not hear of its depredations in poultry yards and sheep-folds. The Marten is a great climber, being as much at home in trees as the squirrels. It is cautious and crafty, taking birds of all kinds, rabbits, and even squirrels, either by stratagem or pursuit. The position of a Marten in the trees is often indicated to the hunter by the chattering flock of small birds which follow it in all its movements, as they do hawks and other foes. The fine engraving on the next page is by a German artist, Carl Deiker, and though representing the European Marten, is an excellent picture of our native animal.

[COPYRIGHT SECURED.]

THE SURPRISE.—MARTEN AND SQUIRREL.—FROM A PAINTING BY CARL DEIKER.—(See preceding Page.)

SILPHIUM LACINIATUM.

The Compass-Plant or Rosin-Weed.

In looking over a recent French work upon floriculture, we were surprised to see one of our prairie plants introduced as desirable for ornamental purposes. The plant is known in the West as the Compass-plant, or Rosin-weed, and to botanists as *Silphium laciniatum*. The first, or generic name, is an ancient Greek one of some plant, which was applied to ours by Linnaeus; while the specific name—*laciniatum*—describes the cut character of the leaves. It is a strong-growing perennial, from three to six feet high, bearing at its summit several rather coarse yellow flowers about 2 inches in diameter. The root leaves, as well as those on the lower portion of the stem, stand erect, and have the general form of the one shown in the engraving. The root leaves are from one foot to two and a half feet in length, and, with the whole plant, of a dull yellowish green. The only claim that this plant can have to a place in the garden must be found in its rather striking, though coarse and inelegant leaves. In the present rage for plants with ornamental or grotesque foliage—"phyllomania," as it has been called—we do not wonder that this *Silphium* has been taken up. Burdock, if it were rare, would exceed in real beauty some of these highly prized and highly priced "foliage plants." The common name, Rosin-weed, is given it on account of its resinous juice, which often exudes and hardens upon the stems and leaves in the form of small yellowish tears. The term Compass-plant is from the alleged fact that the edges of the leaves point north and south. This has given it other names of similar import, such as Polar-plant, Pilot-plant, &c. The statements with regard to the polarity of the leaves have given rise to dis-

cussions, both here and abroad. As we have seen the plant in gardens, its leaves "knew no south, no north, no east, no west," but quite "boxed the compass;" still, evidence goes to show that upon the open prairies the direction of the leaves is so generally towards north and south as to warrant the popular name. The plant is found in Michigan and Wisconsin, and southward and westward. There are five other species found east of the Mississippi, some of which have been cultivated in the garden.

THE AMERICAN WISTARIA.—

The beautiful Chinese Wistaria, now so deservedly popular, was figured in March, 1865. It has nearly crowded out of sight our native species—*Wistaria frutescens*. While we give the foreigner credit for being larger flowered and more showy, we like our native one for several reasons; it is hardier, it is later, and it is American. We had frequently seen it in gardens, where, being only a native plant, it was usually allowed to take care of itself. Last year we set out a small plant of it, and carefully trained it, and it rewarded the trouble by climbing to the height of two stories with abundant side branches; and now, near the end of June, it is filled with

a profusion of its pale lilac clusters, while our neighbors' foreign vines went out of flower a month ago. With our strong partiality for native plants, if we could have but one Wistaria it should be the American. We do not say that it is as handsome as the other, but there is a delicacy, a tenderness, about the color, which pleases us more than showiness. There is a white variety, which is as yet rather rare; it differs from the other only in producing flowers that are pure white. It is a truly beautiful climber.

This Wistaria is a native of Illinois, Virginia, and southward. We believe all the nurseries keep it. By the way, this makes a fine pillar plant, when grown around a post six or eight feet high. Keep the new growth pinched back to two or three leaves, which will induce the formation of "spurs." At flowering time a specimen that has been treated in this way will be a mass of bloom from top to bottom.

The Caper Family of Plants.

The capers of commerce and cookery are the pickled flower buds of a South-European shrub, *Capparis spinosa*. A number of other plants much resemble this in structure, and botanists have brought them together into a family, which, *Capparis* being the type, they call *Cappari-daceæ*, Caper-like plants, or the Caper Family. There are just here more hard words than the *Agriculturist*, often gets so near together, but we like now and then to show that botanists have a reason for using such words. This family is related to the Mustard Family (*Crucifereæ*), but differs in points not necessary to discuss. In some of its members the pistil (and sometimes the stamens) is lifted upon a stalk for some distance above the bottom of the flower. Like

CLEOME SPINOSA.

plants of the Mustard Family, those belonging to this are pungent and often very acrid; some are even poisonous, and all have a very disagreeable smell. Our only representative east of the Mississippi is *Polunisia graveolens*, which is not common enough to have a popular name. Some members of the Family, belonging to the genus *Cleome*, are cultivated for ornament. They are very pretty to look at, but disagreeable to handle, on account of their odor; still, they are free bloomers, and there is an airy effect produced by their curious flowers, that renders them desirable in the garden. Some are perennials, but with us they are usually grown as annuals. *Cleome spinosa*, the one we figure, grows about four feet high, and has a spiny stem. Its spike of flowers is white, or sometimes purplish. *C. grandiflora* grows to the same height as the preceding, and has a larger spike of pale purple. It is the most showy. West of the Rocky Mountains there are several representatives of the Caper Family, and on the Pacific Coast a good-sized shrub, *Isomeria arborea*, which is notably showy and curious, but which probably would not stand our climate.

Old-Fashioned Shrubs and Flowers.

[The *Agriculturist*, while it endeavors to keep its readers advised as to the valuable novelties among plants, also tries to keep the good old plants from falling into neglect. Mrs. "F. H. R." writes us on this subject, and though her communication is not of the practical character usually given in these columns, she puts in a plea for "old-fashioned" flowers so pleasantly, and with such womanly earnestness, that we are sure it will gratify our flower-loving readers.]

"We call these shrubs and flowers old-fash-

ioned because we first saw them growing in all their freshness and homely luxuriance in the old-fashioned gardens, and around the plain, unpretending doorways of our grandparents, so many years ago. The Lilac, with its crisp, purplish, grape-like bunches; the Myrtle, [Periwinkle—Eus.] whose starry blossoms seem almost to have stolen their hues from the sky; the Snowdrop, always so suggestive of the pale, lifeless fingers that so often clasped them,—all these, and very many more, have to us a charm of their own, and so they remain each year in their own quiet, secluded corners, while showy mounds and extensive borders are brilliant with the many-hued gems of more modern times, and redolent with their rarer perfume.

It is the old, dearly loved Past that is dreamed over as one ministers to the wants of these shrubs and plants, in freeing them from the dead leaves, in loosening the soil around them, and pruning them to a healthier growth; and one likes to linger near a Rose-tree or Snowball, bending low with its weight of snowy burdens, and think, 'My grandmother loved these. I used to gather them for her when a child.' Then comes the always fresh remembrance of the old-fashioned garden, old-fashioned ways, and the kindly throbbing hearts of old-fashioned times, and whatever the heart may be now, whether seared with the conflicts of long, bitter years, or hardened to all gentler influences, one moment, at least, has been devoted to that which was pure and good.

So we have a way of dividing our garden into two kingdoms. One shall rule the Past, and the homely beauty of its rose-trees and lilacs shall keep fresh in our minds the dearly loved 'days of old,' and keep the memories of happier days near the heart, that their gentler influences may dispel all the evils that beset it.

Our fuchsias and verbenas and geraniums may still nod their graceful heads at every passing breeze, but we will devote *their* beauty and brilliancy to the Present and Future, with the thoughts, 'They are pure as heaven. The same hand that distills the gentle dew in their grateful cups, and the same air and sunshine that nourish their sweet lives, bring to us as they do to them, life and health. Like them, we must learn to mirror the purity of heaven in our hearts and lives.' So let us devote at least one quiet corner to our sombre-lined flowers, and thus perpetuate our veneration and love for the Olden Times. Once or twice a year, we will walk under their sheltering boughs or stoop to gather their modest tributes, and linger for the sweet story their enfolded leaves and blossoms impart, but for those who come to 'see our garden'—why, we will lead them away from the old-fashioned flowers to admire the rare beauty of our last collection from the green-house."

Odds and Ends in Gardening.

A garden of moderate pretensions well kept is more pleasing than a large and neglected one, even if it be filled with rare and costly plants. Frequent going over the plants and attending to their needs at once is necessary to order and neatness. One who loves plants will be daily among them, tying, nipping, propping, and making everything do its best. Tying materials should be always at hand. For vines and plants generally we prefer Russia matting to anything else. Get a bright, fresh piece, and keep it where strands can be pulled out as needed. Wetting makes them sufficiently flexible. To have the material always at hand, we

cut up the strips into convenient lengths for one or two ties, wet it, and place it in a case made by folding a bit of oil cloth carpet. This can be carried in the pocket of the working coat all day, and be in good condition to use. In bringing into shape plants that were disposed to sprawl too much, we have found Wilcox's Garden Trellis very useful. For some plants this makes too much show; all supports should be concealed as much as possible, and we use a ring of galvanized wire, tied to three small stakes, after the manner of the trellis made of hoops and stakes figured in May last on page 173.

In flower gardens there is much small work to be done, especially among bedding plants before they cover the ground. These are set so closely together that no ordinary implement will work among them conveniently. We took a large kitchen fork, such as is used to lift heavy meats from the pot, cut off the shank at a convenient length, fixed on a handle, and found we had an excellent implement for working among such plants. By its frequent use the surface is left in that open and mellow condition so conducive to the health of the plants and the well-kept appearance of the beds.

The Grape Vine—How It Grows and What to Do with It.—7th Article.

This is the proper place in which to reply to the question of some of our correspondents, *Removing Leaves*.—Never remove the leaves of a vine with a view of ripening the fruit. True, we have recommended the stopping the growth of the bearing shoot at three or four leaves above the uppermost bunch of grapes. This results in rendering the remaining leaf surface more effective, and better able to perform its part in developing and maturing the fruit. The

Fig. 16.—VINE AT END OF FIRST YEAR.

remaining leaves grow larger, thicken up, and become firmer in texture, and are better able to resist disease. The leaf opposite the cluster is the one mainly concerned in the nourishment of that cluster, and to remove it is to take away its sustenance. For the best development of fruit the leaves need full exposure to the sun and air, while the clusters need that genial shade afforded them by the leaves.

Tendrils.—These may be removed; they are of no use to the vine if the shoots are kept properly tied to the trellis, and are often an annoyance to the cultivator. In the wild vine they are needed for its support, but in proper cultivation the shoots are kept in place by artificial means. The ingenious Mr. Meacham, of the Gardener's Monthly, has advanced the idea that plants expend a certain amount of vital force in overcoming the attraction of gravitation, i.e. a vine which has to support itself by tendrils, or by twining, uses up a certain

amount of power which might be turned in another direction. If Mr. M.'s views be correct, (and they have met with the acceptance of some of our best authorities,) then the removal of the tendrils and providing a support in their

Fig. 17.—VINE AT END OF SECOND YEAR.

stead should result to the benefit of the vine. In previous articles we have given various forms of the Horizontal-Arm system of training, and though the modifications of which this is susceptible are not exhausted, we turn now to other plans. It is often desirable to cover a trellis or screen with the foliage of the vine, the shade and shelter being of quite as much importance as fruit. From a neglect of the laws of the growth of the vine—which we have endeavored to set forth in this series of articles—this covering of screens and arbors is usually done in a very unsatisfactory manner. The vine soon gets the better of the cultivator for the want of starting right. To cover a screen or arbor we must keep up a succession of new wood, and constantly bear in mind that a cane that has borne once never bears again, but becomes a part of the stem. Let us suppose that a good young vine was last autumn cut back to three buds, and that the shoots from these have made a strong growth during the summer. In autumn the vine will appear as in figure 16. The three canes at pruning are to be shortened to three buds each. The following summer nine shoots will grow, which in autumn will be ripened into nine canes. The stem will present three divisions, each of which bears three canes, figure 17. In pruning the vine at this time, one of each of the three canes is cut back to two buds, to produce new shoots to extend the vine the next year, while the other two are pruned to eight or ten buds, according to their strength. The shoots from the canes pruned to two buds should the next summer be laid in so as to best cover the trellis. The shoots from the buds upon the longer pruned canes will produce fruit. These should be kept tied to the trellis, and when they have made three or four leaves beyond the fruit, be pinched—indeed, treated just like upright fruiting shoots heretofore described. These canes are simply upright arms, bearing their shoots one above another, instead of in a horizontal position. At the end of the year in which we suppose this growth to have been made, the vine will appear as in figure 18, which shows only a portion of the vine. The vine in this condition, in which it is supposed to have quite covered the screen, is to be pruned with judgment and with the laws of growth well in mind. The weaker canes are to be cut back to one bud, the others to two, three, or more buds, as may be required. It is necessary to recollect that every bud will produce a shoot, and to look forward to the future growth. In the treatment of such vines, too many rather than too few buds are apt to be left. While a

vine grown in this way will not produce as fine fruit as in a system in which the pruning is closer, it will do much better than those subjected to the usual haphazard treatment.

Fig. 18.—VINE AT END OF THIRD YEAR.

When a screen is needed for the sake of privacy, or for shutting out unsightly objects, a grape vine answers excellently. We should say that the figures used in this article are from the excellent work, "Grapes and Wine," by Mr. George Husmann, of Hermann, Missouri.

A Stand for a Hand Microscope.

Those engaged in studying plants or insects need a magnifying glass which will allow them to have both hands free to dissect with. Such instruments are made in this country, but as they cost from \$12 to \$15, they are out of the reach of most young students. It is a pity our instrument makers don't furnish us with a

Fig. 1.—MICROSCOPE STAND.

cheap and good glass of this kind, as they do in France. A tolerable substitute may be made by mounting a good pocket lens in the manner shown in fig. 1. A strong upright wire is fixed to a heavy foot, which may be lead, iron, or any other material heavy enough to be steady. Upon this wire is placed a large cork, and through the cork at right angles to the upright is pushed a smaller wire, to serve as an arm to hold the glass. The end of this wire is bent up at right angles, and fits into holes bored in the shield or cover of the glass. The wires should fit into the cork moderately snug, but not so tightly as to require much effort to place the glass in any required position. For a stage on which to place the object to be examined or dissected, a white jar or druggist's gallipot answers very well, but this serves for opaque objects only. With most transparent objects some contrivance for throwing light up from below must be adopted. As simple a stage as any is to cut a block of some heavy wood as

shown in figure 2. A piece of clear glass is to be placed across the opening, and held in place by being let into the wood. Below this a bit of looking-glass should be so hung that it may be placed at any desired angle. For dissecting, some needles fixed in wooden handles, a small and very sharp knife, and a delicate pair of tweezers, will be required. We know of one who has acquired a botanical reputation who for a long time continued his investigations with an apparatus as simple and rude as that we have described.

Fig. 2.—STAGE.

The Club-Root in Cabbages.

The cabbage, as well as the cauliflower and the rest of its immediate relatives, and also the turnip, are liable to a disease which has received the names of Club root, Clump-foot, Ambury, Hanbury, and when it occurs in turnips, Fingers and Toes. In England, the term Ambury is most generally used to designate this trouble, while in this country it is commonly called Club-root. This disease is one of the greatest difficulties with which the cabbage grower has to contend. Writers upon the subject, both here and abroad, attribute it to a small insect, which they designate by the indefinite name of "the weevil." In the cabbage the trouble often makes its appearance in the seed-bed, a small, gall-like excrescence being found on the stem near the root. This contains a small maggot which goes on eating its way into the stem, and as it progresses, the excrescence increases in size, until it presents a form like that given in the engraving, which is taken from a specimen sent us by C. L. Parker, N. C. The maggot eats its way out, the swelling soon begins to decay, and the already sickly plant dies. It has been stated that this disease does not occur in soils containing plenty of lime, while this is contradicted by others. It is pretty well established that the kind of manure has not, as has been alleged, anything to do with the trouble. The principal point is to know the habits of the insect that causes the mischief, its time of appearing, etc. If the attack is made only on the young plant in the seed-bed, then we shall know how to fight it. If plants which already contain the egg or maggot are set out, it makes but little difference whether they are put in a soil containing

CLUB-ROOTED CABBAGE.

an abundance of lime, or in one deficient in this constituent, the mischief having already been done. If the plant is liable to attack at any time during its growth, then lime may prove a preventive. One English writer thinks that the trouble begins in the seed-bed, and recommends transplanting the plants before the final setting

out. At this transplanting the roots are to be examined, and if any excrescence is found, it is to be cut off and the plant will soon recover. Among the remedies proposed are lime, charcoal, soot, and dry clay; these are to be sprinkled abundantly over the seed-bed, except the charcoal, which is to be placed upon it in a coating half an inch thick. The subject is one which needs careful study by intelligent observers.

STARTING STRAWBERRIES IN POTS.—This plan is gaining favor among cultivators. Small pots filled with good earth are sunk in the beds under the runners, and when the young plant has become well rooted, it is separated from the parent plant. This plan allows planting to be done at almost any time, as the plant may be turned out of the pot without disturbing it.

Notes on Strawberries.

Each year brings its quota of new seedlings, and the present one is no exception. In the eyes of the originators of some of these new plants—many of them hardly merit the name of new varieties—their productions have a greater merit than any heretofore known, and they expect others to see the fruit in the same light. Other patient experimenters are willing to wait for results, and try again and again, until they feel that they have something worthy the attention of pomologists. The ease with which strawberries are raised from seed, and the short time required to obtain results, has increased the number of seedlings within a few years, at a fearful rate. Many so-called new berries are so much like older ones that it is impossible to remember any distinguishing characters about them. Our catalogues become filled with names without any really distinct fruits belonging to them. No one should exhibit, much less offer for sale, a strawberry, unless he can show that in some respects it is superior to the varieties already in cultivation. Some growers of seedlings have strange notions of the possibilities in fertilizing, and we are often told that such a berry is from the Wilson, for instance, crossed by two or three others. Now, one seed of the many which a strawberry contains can only be fertilized by the pollen of one other berry. If the pollen of two or more other varieties be applied, that of one only will be effective. We give notes of some of the newer sorts that have come under our notice during the season just past.

BOYDEN'S No. 30.—This variety is a seedling by Seth Boyden, the originator of the Agriculturist strawberry. It was exhibited last year by Mr. B., and this year has been tested by several others. The vine is of remarkable size and vigor of foliage, and the fruit is probably larger than that of any other variety. The color is of a fine scarlet, and the berries are of a good conical form, and of moderate firmness. Flavor not high, but pleasant. The fruit often measures six inches in circumference, and retains a good shape, not often seen in large berries.

BLACK DEFENCE.—This is a seedling by Mr. E. W. Durand, who produced Durand's Seedling. It is a good-sized, conical berry, somewhat disposed to coxcomb. The color is very dark crimson, reminding one of that of the old Black Prince; solid, and remarkably juicy; flavor very sprightly and rich, without too much acidity. This variety received the premium at the N. J. State Exhibition, as the best new seedling. Mr. D. presented six other seedlings, viz.: Regulator, Glossy Conc, Duke, New Jersey, Luxuriant, and Brilliant. Of these the commit-

tee considered two worthy of special notice: the

LUXURIANT.—A large, flattened, globose fruit, very uniform in shape and size, of a very good flavor, and remarkably sweet; and the

NEW JERSEY.—A crimson, conical, white-fleshed and showy fruit of very good quality.

LADY OF THE LAKE.—A new seedling by J. Scott, of Brighton, Mass. A short-conical fruit, of good size; scarlet, inclining to crimson; moderately firm, sweet, and of fair flavor. Some of our Massachusetts friends think that in this fruit will be found all the good qualities of the Wilson's Albany without its objectionable acidity.

WILDER'S No. 13.—A conical berry of excellent shape, and remarkably uniform in size. It is not among the largest, but large enough. The surface is firm, and of a brilliant scarlet, presenting that polished appearance so noticeable in the *Triomphe de Gand* and *La Constante*. Flavor remarkably delicate and pleasing. This is the result of years of experiment, and the one among thousands of seedlings considered by its originator as combining the most desirable qualities. A cross between *La Constante* and *Hovey's* seedling. We hope that Col. Wilder will accede to the wishes of his pomological friends, and allow this excellent and handsome fruit which cost him so much labor to produce to bear his distinguished name.

ROMEY'S SEEDLING.—This new variety, which we noticed last year, has appeared again at the various shows. The plants we have seen at the exhibitions, said to be of field culture, were abundantly fruitful. The fruit is much like the *Triomphe de Gand*, but it is claimed to be better, more hardy, and more productive. If such is the case, it will soon become popular without the use of extravagant advertisements.

BARNES' SEEDLING proves to be an excellent market fruit. It has been exhibited from Ten Eyck Bros., Monmouth Co., N. J., by S. B. Conover, in packages taken from a lot sent to market, and attracted much attention by its large size, firmness, and general good qualities.

CREMONT.—This old variety is now so rare as to have all the interest of a new one. It originated in Louisiana, and had its day of popularity. It ranks among the large varieties, and is regarded as particularly valuable for forcing.

MAL-FORMED FRUITS.—Every year we have more or less specimens of mal-formed fruits sent to us. These are often interesting, but it is not always convenient for us to place them on record. A common departure from the usual manner of growth is the complete union of two or more fruits, as we have seen in the cases of cherries, cucumbers, melons, apples, and especially tomatoes. Another freak is the production of one fruit within another. A similar thing is often seen in roses, when a bud is produced in the center of a flower, and

sometimes another bud from the center of the second flower. Mr. W. S. Gates, of Erie Co., N. Y., sent us a specimen of a young pear in which this state of things is plainly shown, as seen in the engraving. The end of the flower

stalk which usually terminates in the base of the flower kept on growing, and produced another flower above the first one, and the fruits resulting from the two became consolidated. The foreign journals have within the past year figured a number of similar cases.

CALLICARPA AMERICANA.

Shrubs with Showy Berries—Callicarpas.

Our natural autumn landscape is rich enough with the many tints of the ripened foliage. We can add to the charm of autumn in our gardens and grounds by the use of those trees and shrubs which bear showy fruit. In planting for summer effects we should not forget those of the later season, and in all places where shrubs are grown at all, some of those bearing bright berries should be introduced. What is more brilliant than a Burning-bush (*Euonymus*), or a Black Alder (*Ilex verticillata*), when lighted by a declining October sun? Red berries we have in abundance, and the Snowberry affords us a pure white. We wish to call attention to a quite neglected shrub which gives us an unusual color, a rich purple. The *Callicarpa* of our Southern States (*C. Americana*), is found from Virginia southward; it is a graceful shrub three or four feet high, which bears clusters of inconspicuous flowers in the axils of the leaves. In the autumn these fruits assume a most beautiful violet purple color, and make the shrub highly ornamental. The engraving shows a branch of the natural size. From the color of the fruit, the shrub is called at the South the French Mulberry. It is not, however, related to the Mulberry, but belongs to the Verberna Family. The name, *Callicarpa*, is from the Greek, signifying beautiful fruit. A Japanese and a Chinese species are in cultivation. The *Callicarpas* succeed in any rich garden soil, and late in the season prove to be very attractive.

Varieties Produced by Pruning.

The Gardeners' Chronicle (London), gives an abstract of a paper read before the Linnean Society by Mr. B. Clarke, on the production of varieties by pruning. His idea is that the modifications produced by pruning are in a degree perpetuated by seed, and that by constantly pruning the offspring of such plants in the same way a variety or race may ultimately be established. He suggests Indian corn as a suitable subject for experiment, and publishes the following suggestions for those Americans who wish to try it. The results, whether confirming Mr. Clarke's views or not, would be interesting, and doubtless some of our readers will feel disposed to experiment. We do not look for any present increase of the corn crop from this process. We have not tested what can be done by selection of seed from the corn as it now grows. "The whole of the male flowers are to be cut off by cutting the stem across, a week or fortnight before the first flowers would begin to open, and the female left to be fertilized by other plants close at hand; this would, if repeated three years, it may be expected, produce a variety having only half the usual quantity of male flowers; and if so, there would be a proportionate increase of flowers on the lower part of the stem, which it may be confidently expected would be female, *i. e.*, an increase in the number of spikes of females, or cobs, as they are called when matured. If the plants left for the purpose of effecting fertilization had the upper half, or two-thirds of the male inflorescence removed before the flowers opened, the variety, if produced, would take a shorter time by a year or two. One plant having all the male flowers removed, placed between two having the upper half or two-thirds of them removed, would, it is believed, be the better way of making the experiment in the first place. If the male flowers were removed very early by splitting the sheathing leaves open, the experiment might perhaps be less successful as regards utility, in consequence of the growth of the plant being checked; but varieties departing further from the original type might be expected. In one of the plants so treated, the upper spike of female flowers produced a quantity of male flowers at its apex. Supposing, then, that the increase of female flowers amounted to only one-fifth, this would be, for the United States alone, an increase of produce amounting in value to more than \$100,000,000 per annum."

BLACKBERRIES AND RASPBERRIES.—Some one writes to ask why these fruits so unlike in some respects are both called *Rubus* by botanists. The difference in the two is not so great as it appears. The fruit, as we term it, of both is not a simple fruit, but a collection of fruits. The grains of which the berries are made up is each a distinct fruit, the result of a distinct pistil. Each grain is in structure like a minute plum. The grains in the raspberry cohere slightly to one another, but when ripe they have a very slight attachment to the end of the stem on which they are placed—receptacle, as it is called,—and the mass slips off, leaving the receptacle as in the engraving. In the blackberry the grains adhere closely to the receptacle, which becomes more or less juicy and eatable.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Sea-side Fare—The Crab.

Though related to the lobster, the crab is a very different looking animal, and at first sight the points of resemblance are not very manifest. The crab seems to be all body, while in the lobster that part popularly called the "tail" predominates. In order to represent the crab fairly, we give two

Fig. 1.—EDIBLE CRAB, ONE-THIRD SIZE.

engravings, one showing the upper side, and the other the lower side. Viewed from above, fig. 1, we see that which corresponds to the body part of the lobster, with the mouth and eyes in the center of the rounded edge. The sides of this portion end in two sharp points. Turning the crab over, we see in fig. 2, how the legs are attached. The two forward ones are, as in the lobster, enlarged to form claws or pincers, while the rear pair are thin and broad, to aid the animal in swimming, and are called "flippers." The part corresponding to the "tail" of the lobster is very small and inconspicuous in the crab, and is closely bent under the body, as seen in the engraving. It has much the appearance of the "tuck" of a pocket-book. In the female, the eggs are carried under this "apron." Crabs are caught in shallow water by means of nets, and in deep water by baiting a net stretched over a hoop with meat, which is quite as good for this purpose if it has passed the point at which it is fit for food. Sometimes a long line is set, with bait placed at intervals, and the fishermen pass along the line in a boat, and remove the crabs that have taken hold by means of a hand-net. When taken from the water, the crab is of a dull olive green, with some blue about the claws; it is very lively and pugnacious, and capable of giving a severe nip with the claws. Taken up by the flippers, or by the portion between them, the animal is unable to inflict injury when handled. The crab may be regarded as a delicacy, or luxury, rather than an article of substantial food. It is more tenacious of life than the lobster, and will live for a number of days in moist sea-weed. It is cooked by being plunged into boiling salted water, and after cooking for twenty minutes, is taken up and cooled, when it is ready to be eaten. The boiling converts the olive coloring of the shell to a bright scarlet, while the white portions become still whiter. To eat the crab requires some patience, and a hungry man had better take some other food, and pick at the crab after his hunger is mainly satisfied. In eating the crab, the claws are removed and cracked, and afford a nice bit. The legs are generally rejected, though some like to munch them for the little meat they contain. By a pull, placing the thumbs at the mouth, the upper shell is separated from the lower portion, which contains the meat. The gills, some fringe-like, uncaten-

looking bodies, are removed, and then the remaining part is broken up by the fingers. The meat is found enclosed in tough, elastic membranes, which answer to the crab for bones, and has to be picked out. When served in the rough (*au naturel*), the meat is eaten as it is picked out. When crabs are served at the table, the meat is carefully picked out, and with the addition of the "coral" (spawn) from the female, as well as the yellow fat, chopped and dressed with whatever seasoning may be fancied—oil, vinegar, mustard, pepper, etc.,—and then filled into the upper shell, which has been properly cleaned.

Another way is, to pick out the meat as above, warm it up in a saucepan with butter, bread crumbs, and seasoning; fill the shells and put bread crumbs over, then place for a few minutes in a hot oven until of a good brown, and serve hot.

SOFT-SHELLED CRABS are among the high-priced delicacies found in our city markets and restaurants. The crab, enclosed in its firm coat, cannot increase in size, so in the spring of the year it manages to shed its shell completely, claws and all, even divesting itself of stomach and other interior portions. In this condition, it is a poor, defenceless thing, covered only by a tender skin, and being quite incapable of offering the least resistance to an enemy, it conceals itself in a hole or under some protection. Shore people tell us that at this season they always find a hard crab ready to act as a defender of the soft-shelled one. During this defenceless condition the animal makes its growth, the shell gradually hardens, and it comes out a new edition, "enlarged and corrected." It is in their soft-shelled condition that the crabs possess their greatest value, and the trade in them in the season is of considerable magnitude. The softer the crab, the more valuable it is; in a few

Fig. 2.—UNDER SIDE OF EDIBLE CRAB.

days after shedding, the skin becomes tough, and it is known as a "leather-back." In the New York market soft-shelled crabs seldom sell for less than one dollar a dozen, and often higher. Like the others, they are always cooked alive. The crab is first dipped in beaten egg, then covered with powdered cracker, after which it is put, with all the cracker that will adhere, into an abundance of hot fat. The crab dies instantly, and is cooked until the cracker becomes of a good brown. Good either hot or cold. In this state all of the animal is eaten, except some tough portions about the mouth. Several other species of crab are found along our coast; these are very interesting to the naturalist, but few of them are of value as food. A kind called the "stone crab" is often caught in the nets of the fishermen in winter, and kept in a "car" until it sheds its shell, when it is eaten. A very small crab is found as a guest of the oyster, enclosed within its shells. These crabs are about the size of large spiders, and resemble them somewhat. The oystermen save them and sell them to those who are fond of them stewed like oysters and eaten entire.

Household Talks.

BY AUNT HATTIE.

I have just been bottling the ginger beer that I made yesterday. We are all fond of it and find it very refreshing this sultry weather. It is made as follows: Pour into a vessel upon the fire 2 gallons of spring water. While it is coming to a boil, mix well together 2 lbs. of white sugar, 2 ounces of bruised ginger, 2 ounces of cream of tartar, the grated rind of one and the juice of two lemons. As soon as the water boils, stir in the mixture, and let it simmer for twenty minutes or half an hour. Set to cool in a large crock, and when nearly cold, spread a small piece of bread with a little good yeast, and place to float on the surface of the beer. Bottle the next day, securing the cork firmly. Only good strong bottles should be used. This is rather an extravagant luxury for a large family, and sometimes I reduce the expense by using less sugar, and a little cream of tartar, but my reputation for making excellent ginger beer suffers in consequence.

My plums look delicious, certainly. I pride myself on my plum preserve. There is a great difference between the unbroken luscious fruit so temptingly surrounded by its natural juice, as I make it, and the brown, burnt looking mass of jam I sometimes find at the tables of some of my friends. The large blue plum and greengages I generally bottle. Damsons, when done up lb. for lb., will keep perfectly in crocks or jars, and as they require nearly or quite that amount of sugar to make them palatable, I prefer to do them up in this way, as I can always find plenty of fruits and vegetables to fill all the self-sealing bottles I have. My method, however, of extracting the juice is the same in all cases. Procure a jar or crock that will go into the oven. Proportion the sugar to be used, wipe and stem the fruit. Place a layer on the bottom of the vessel and sprinkle well with some of the sugar, another layer of plums and sugar, until the crock is full. Cover and place in a moderately heated oven, allowing them to remain for ten or twelve hours. It will do no harm to take the jar out occasionally, if the oven is needed or should be too hot. I usually put mine in about tea time, and by the next day they are ready for the final doing up. Separate juice and plums by a colander, put the juice into a brass or porcelain kettle, (on no account use a tin or iron, as the color will be spoiled), adding the sugar not used the evening before, and place upon the stove. If I am using the blue plum or greengage, as soon as the syrup has well boiled I put in the fruit, and when it boils perfectly, bottle and immediately put on the lid securely. With damsons the syrup should be simmered and skimmed until no more scum will rise; then the fruit should be added, and the whole boiled slowly for thirty or forty minutes, when they may be poured into small jars or crocks as convenient.

Black currant jam may be made in this way; this fruit does not require quite so much sugar however. The jam is excellent for colds, and some persons are fond of it in tarts or as a table sweetmeat.

We use so much sponge and rich cake that for some time I have been thinking that I must adopt a cheaper kind for every day use, both because eggs and butter are so dear, and because I think that a plainer kind would be far healthier for us, the children especially. Last baking day I tried the experiment, and made a very palatable cake from the cheapest materials. Even Edward, who is rather fastidious, ate some of it, and when asked for an opinion, said it would do. Place two teacups of brown sugar in the cake bowl, with one teacup of lard and a half teacup of caraway seeds. After mixing to a foam, add two teacups of sour milk, and stir well again; sift with the flour 1 tablespoonful of baking powder; about 4 teacups of flour may be needed, perhaps 5. When the flour is well blended in, add 1 teaspoonful of soda previously dissolved in a little water. Bake in a well-larded tin for at least an hour in a moderate oven.

The peach season will soon be at its height, and I

have no doubt that I shall enjoy the preserving and pickling processes very much. I always do. An excellent housekeeper, and one who has always been ready to adopt any reasonable expedient for saving time or labor in the household, gave me the following recipe for skinning peaches. I can assure you, that if the directions are followed you will be able to remove the skins of your peaches pleasantly and expeditiously. Place in an iron kettle two quarts of good, sweet, fresh, wood ashes (not coal ashes) cover with four quarts of soft water, and let it boil for a few minutes. Put in a dozen or so of peaches and keep the pot boiling; count 20 moderately and take out the peaches, throwing them immediately into a pail of cold water. Take one in your hand and with the thumb gently remove the skin. It will slip off almost without this aid, leaving a round, beautiful ball in your hand; pass this to another pail of water, from which they may be halved, stoned, or quartered, as desired. If the lye fails to effect the skin, the ashes are not good, or it is not strong enough, and more ashes should be added. Remember that wood ashes only should be used. The peaches should on no account remain in the boiling lye long enough to cook them ever so slightly. The business of bottling peaches is so simple that I hesitate to give directions, yet I can but remember that many housekeepers signally and positively fail to have their fruit keep. I have bottled peaches for the last seven years, some with and some without sugar, and never in that time have had a single bottle to ferment, mold on the top, or turn musty. A bottle or two of strawberries may have molded—occasionally some of them have turned watery—and at one time six bottles of blackberries fermented, and of course popped, but peaches have always been an inviolable success with me. The secret of bottling fruit successfully is not in the quantity of sugar used, nor the absence of water, or in the length of time boiled,—all of which were actual requirements in the old-fashioned manner of preserving,—but the secret lies in there being no germ of fermentation left undestroyed in the fruit itself, and in the actual expulsion and exclusion of the air. Boiling the fruit expands it, and to make room for the expansion the air must be expelled, and hermetically sealing the bottle while the contents are in this heated and expanded state precludes the possibility of the air again entering while the bottle and fruit are cooling.—Yes, you say, that may be logical, but I fail to see through your explanation. Well, then, never mind the science, but accept the recipe. When a quantity of peaches are ready, prepare your bottles by putting them into warm water to season them. Place upon the stove in a clean porcelain or brass kettle, two quarts of water and perhaps a pound of white sugar, or sweeten to any extent desired. When boiling, put in a quantity of peaches either whole or in halves, and the moment they boil positively all throughout, with a fork take out a peach at a time and fill one bottle, being careful not to crush or bruise them; then with a hot teaspoon fill up to the brim of the bottle with some of the boiling syrup, and seal immediately. I generally place each bottle on a tin plate by the side of the kettle and allow it to stand there until filled and sealed. Care should be taken to put into the kettle as nearly as possible a quantity of fruit proportionate to one or two or three bottles, as it is desirable not to renew the kettle while any fruit remains in the syrup, as they will boil too much and the syrup will not be clear. If one or two should be left over, remove to a dish each time, and when the others are done, place these in the kettle, give them a boil up, and bottle by themselves or have them for tea. As the syrup is exhausted in the kettle add more water and sugar. I always endeavor to have a kettle of boiling water on the back of the stove, and using this I do not have to wait long for the syrup to boil. Fourteen ordinary sized peaches halved will be sufficient for a quart bottle, and ten where the stones are not removed,

Indian Baked Pudding.—Mrs. H., Terre Haute, Ind. This institution of Yankee land is prepared by boiling a quart of milk and stirring in slowly

a large teaspoonful of meal. Add two tablespoonfuls of sugar and one of butter, and spice to taste. It is very much improved for some tastes by slicing up five or six apples. Bake two hours or longer. It was customary to bake it all night with the brown bread in a brick oven.

Fly-Time.

Next to "dust," flies are probably the careful housekeeper's greatest annoyance. Those we have must be direct descendants of those of Egypt, for they are great plagues. The common house-fly breeds in manure, and is different from the one which deposits its eggs in meat. At the close of the warm season enough conceal themselves in cracks and crannies to continue the race. We are sometimes asked how to destroy them. Unless they are kept out of the house, there is but little use in attempting to destroy them. It is an old saying "For every one killed a dozen will come to his funeral." Most of the destructive agents depend upon their attractiveness, and are quite sure to draw as many as they kill. Leaving out of question the various traps, home-made and otherwise, we notice some of the other fly destroyers in use. An article is sold at the drug stores and elsewhere under the name of Cobalt and Fly-powder. This is mixed with sweetened water and set about in plates. It will kill flies—and human beings also. *Don't touch it.* There is no Cobalt about it; it is only crude metallic arsenic ground to powder, and is a deadly poison. There have been lives enough lost already through the use of this dangerous stuff sold under a false name. An infusion of quassia wood, sweetened, will kill flies, if they eat it. This is harmless. We believe that some of the "fly-papers" are prepared with this. In New York, and we suppose in other large cities, the regular lung and rat destroyers sell what they call "Catch 'em Alive, Oh!" This is sheets of paper smeared with a mixture of resin and some fatty matter, to make a sticky coating much like a freshly varnished surface. If a fly alights upon this he is held fast by his feet and struggles until death comes to his relief. There are other fly-destroying devices, but these will do as examples, as we do not believe in any of them. The only way to manage with flies is to keep them out. All rooms when not in use should be kept perfectly dark in fly-time, and those in constant use be provided with screens to both windows and doors. These are frames upon which is stretched wire cloth, or the less expensive mosquito netting. This is no little trouble, and freedom from flies is obtained at considerable sacrifice of one's own freedom of motion. To us there is a sense of confinement in rooms provided with screens like these, and we prefer open windows and free air, even if we must have the flies along with them. The number of flies will be much lessened if great care be taken to keep all sweets and everything attractive to them carefully covered up and out of their reach. Wherever there is anything out of doors that attracts flies, it is as good as a warning from the Sanitary Inspector that it should be removed.

The Cooking of Vegetables.

It is astonishing, nay lamentable, to observe how little variety in the way of vegetables is enjoyed by farmers' families. We are reminded of this by a letter from Mrs. A. W., who is determined to have a greater variety in her "garden patch." She finds upon looking over our garden hints that there are many things that she knew nothing about. Among these are cauliflower, egg plant, salsify, spinach, okra, martynia, etc. The writer need not ask us "not to smile at her ignorance," for there are thousands all over the country who never even saw these things, much less have them as a part of their daily food. The *Agriculturist* has for years been striving to make the farmer's home more pleasant, and one of the ways of doing this is to advocate a greater variety of wholesome food. Our correspondent complains that, while she can learn from our pages where to get the seeds and how to cultivate the plants, she has no instructions how to

prepare them for the table. Perhaps we have said less about cooking vegetables than we ought, and we are always glad to have our household friends indicate the kind of information they want. It will be impracticable to dispose of our correspondent's list in a single article, so we will begin with the simplest—and we had almost said the best—

THE CAULIFLOWER—and what is said about this applies to broccoli, which is much like it, but a harder plant, in which the "head," or eatable portion, is green or purplish, instead of white. Some boil the cauliflower whole, but we prefer to divide it into several pieces, as it cooks more evenly, and also allows one to ascertain if any insect or slug has secreted itself within. Wash the head, and put it into a pot of boiling water that has been slightly salted, and let it boil until the stem end becomes soft. Remove with a skimmer, as it is too tender to take up with a fork, place upon a dish, and pour over a dressing of drawn butter—the simple sauce made with butter, flour, and water, and—that's all there is of it, except to serve it. It is no more trouble than cabbage, but vastly more delicate to the taste and digestible in the stomach. Many eat it just as served, with the butter dressing, while others prefer to use vinegar, as with cabbage. To spoil cauliflower, boil it with meat.

SPINACH.—We gave directions a few years ago, and briefly repeat. One way is to put it into water (boiling, of course), cook until done, take up, drain, and serve. In short, treat it like any other "greens." An improvement on this is to take up the spinach when done, chop it, and warm it with a plenty of butter, and serve. To have spinach at its best, it should be cooked in a very little water. Wash, and place in a saucepan with only the water that adheres to the leaves, add a lump of butter, and stew gently, with the pan closely covered, until tender. Take out, chop fine, and return to the saucepan with more butter—no matter how much, hardly, for spinach will allow of the use of a large quantity, if one has it to spare. Seasoning of salt and pepper may be added—some use nutmeg—heat up again, and serve. It is very common to garnish or ornament the dish with slices of cold boiled eggs. Other of the less known vegetables will be treated of at another time.

Recipes for Dyeing Carpet Warp.

Miss "E.," Erie Co., N. Y., sends the following recipes for dyeing carpet warp, which she says have been well tested. From what we know of dyeing, the directions seem practical. It should be borne in mind that the material when wet always looks darker than it will when dry, and in order to judge whether the desired shade is obtained, it is necessary to wring out a small portion quite dry before deciding that the shade is deep enough. After the material is dried, it should be thoroughly rinsed in an abundance of soft water until no more color is imparted to the water.

Green.—For three pounds of warp, take one pound of fustic, one half pound of logwood chips, a piece of blue vitriol the size of a hickory nut, and three pails of water; boil one hour.

Purple.—For fifteen pounds of warp take four pounds logwood chips; boil them in two pails of water. Dissolve one pound alum in a pail of hot water; pour the alum water to that containing the logwood, and boil your cotton in it one hour.

Yellow.—For five pounds of cotton, dissolve eight oz. sugar of lead in four qts. of warm water, and dissolve five oz. bichromate of potash in three qts. of warm water. Put the cotton in the lead water first, wring it out and put it in the bichromate of potash water; continue until you have the shade you wish.

Pink.—For five pounds of cotton, take two pounds of Nicaragua or Red wood, four of solution of tin; boil the wood an hour in six qts. of water. Pour the dye into a tub and add the solution of tin, put in your cotton, let it stand five minutes, and you will have a nice color. [The solution of tin may be had of the druggists under the name of the chloride or muriate of tin.—Eds.]

BOYS & GIRLS' COLUMNS.

Our New Policemen.

They are wiry, spy little fellows, not so big as "Tom Thumb," but they are the most expert thief takers in the city. They are dressed in a neat uniform of gray and brown, each with feathers in his cap, and armed with a sharp instrument formed something like a pair of nippers, with which they seize marmalades, and they seldom fail to make a capture when once they give chase. Our patrols, especially, have for years been infested with hordes of lawless characters, that defaced the public ornaments, disgusted the people with their vile practices, and made themselves an intolerable nuisance. Scarcely a tree or shrub was left uninjured, the walks were disfigured, and passers in their vicinity seldom escaped being pounced upon by one or more of the uncanny tribe. Many plans were tried to repel and destroy them. Cunning traps were set to catch them; poisonous mixtures were prepared to mix with their food, and rewards were given for their capture; still they seemed to thrive and increase. At last, some one suggested that a family named Sparrow lived in England, noted for their success in dealing with such ugly customers, and some of them were induced to emigrate here and practice their profession. Their success is most gratifying. Those pests, the Millers, Moths, Canker-worms, Caterpillars, Measure worms, etc., as these thieves were named, are rapidly disappearing, and the new policemen are pelted by every body. Commodions houses have been put up for them, the children divide their bread and cake with these friends, and by the help of these and other benefactors there is a prospect that the shade trees of our cities will hereafter be ornaments instead of wormeries. Now the next time you go out to try your skill as a mark-man, please don't murder any of our friends who are trying their hand at their catelching in your neighborhood. Otherwise, may the whole brood of unclean and rapacious insects and vermin torment you by day and haunt you by night, until you are reclaimed from thoughtlessness and ingratitude.

Ways of Getting a Living—III.

TRY YOUR WEIGHT, SIR?

The man with the weighing machine is well known in the neighborhood of New York, and some other large cities. He may be found wherever a large number of people gather, especially on any holiday occasion. His apparatus is usually a frame of three upright poles, with a spring balance hung from the top, and a chair swung from the balance, for the convenience of customers. It is amusing to notice that in most cases people weigh more on these machines than when standing on Fairbanks' Standard Scales. The proprietor of the establishment knows something of human nature. Most persons like to weigh well, in body as well as character. We have seen a man pull down two hundred pounds on the scales, and get off with an air that said, "There's a feat for you." This man looked pleased when their weight was given at five to ten pounds more than they expected. Thus the operator worked upon the vanity of his customers and sent them off well pleased with themselves. In this, as in many other ways of getting a living, curiosity is principally appealed to, and there is enough of it in every large community to enable those who gratify it to "turn a penny" often, and thus gain a livelihood.

New Insect.—"Mother," exclaimed an affected young lady, just home from boarding school, "mother, here is a grammatical error in the Bible!" "Law sakes!" replied the old lady, adjusting her spectacles. "Kill it! kill it right off, for I do believe it's the pesky thing that's been eatin' up all the bookmarks."

Curiosities at the Museum.

Among the curiosities exhibited at Barnum's Museum before its destruction by fire were many things which a casual observer would not be likely to notice. Our artist has sketched a few of these for the amusement of the boys and girls who have eyes sharp enough to see what can be found by looking carefully. If the curious figure behind the visitor in the picture could have been kept there, its exhibition might have made a fortune for Barnum.

Pleasant Recollections.

"Uncle Jim" writes to the *American Agriculturist*: "I am yet a young man, and it seems but yesterday when I was raising my little crop. I well remember how father and mother were initiated in the cultivation, gathering, and marketing of the same, and what an interest they took in advising me so as to prevent a failure. Then they pointed out a place where I could loan my money to a good reliable man, and receive interest at the rate of six per cent per annum. A note was given, and how carefully it was stored away among my treasures! At the appointed time I received all the principal and the interest, and at the suggestion made by mother I bought a young colt. That colt was well cared for, and when grown, what a handsome price it brought! Oh, I was rich enough! 'But no,' said father, 'if you buy a lot,' showing where it was, 'some day you can put a horse on it, and then you will have a home of your own.' New aspirations flitted o'er my mind; the lot was purchased, and strange to say, since I began this epistle, a little boy colored and paid me a month's rent, an income on this same investment. And now, upon the same farm, I too am raising a boy who is receiving encouragement in a like manner, and to see how he is striving to outstrip me repays me for all my trouble. A finer home, a finer lot, are his aspirations, and the chances are for his success. This little boy, who is twelve years old, has attended to his horse, and helped milk three cows, and carried one gallon of milk one half mile distant each day, besides attending school and receiving the highest percentage for good scholarship. Farm life for him will be among the cherished memories. Two more subscribers to the list previously sent you are monitors of his perseverance."

Answers to Problems and Puzzles.

The following are the answers to the puzzles, etc., in the July number, page 353. No. 310. *Metagram*.—Zone, Bone, Tone, None. . . . No. 311. *Illustrated Robs*.—Quotation from Pope's Essay on Man.—2 P R in ce applies in hu man gnst ewer rein s elf love two urge, rea sun toe rest rain; or, Two principles in human nature reign; self love to urge, and reason to restrain. . . . No. 312. *Mathematical Problem*.—2,001,399,534—farms of 300 acres each. . . . No. 313. *Conundrum*.—She has a tail in press. The following have sent correct answers to puzzles previously published. Eva Gray, Henry A. Drury, Levi Capp, Aaron B. Leach, Stanhope E. Leach, J. West Homer, Marins Heighton, James A. Baxter, R. Herward Millar, N. E. Melick, Charlie Weber, J. P. Webber, Clara T. Shannon, Addie A. Hadley, E. P. Washburn, J. A. Littell, Sallie J. Work, A. P. Henry, Thos. C. Hughes, "C. L. B.," H. Elliott, W. Shelly, Sarah Emma Horton.

New Puzzles to be Answered.

No. 314. *Logograph*.—(The word "logograph" means a word net, that is, a word enclosing others like a net.) My home is a cold, damp, uninviting place. When taken from it, I repay the service with cheerfulness and com-

fort, and I have added to the fortunes of many. I contain 1st, the name of one of my greatest friends. 2d. Half of a beautiful bird. 3d. Everybody's favorite. 4th. The head of Benjamin Franklin. 5th. An engineer's and lady's assistant. 6th. Something often put on a drum, on a shoe, also found in barrels. What is the word?

No. 315. *Mathematical Problem*.—I have a lot of ground 100 feet long and 80 feet wide. I wish to make a ditch inside of the boundary of said lot, so that the ground taken out of the ditch may raise the balance of the surface of lot one foot higher. The breadth and depth of ditch are to be made equal; what ought they to be?

No. 316. *Picture Puzzle*.—Why does this picture represent the office of the Pope?

No. 317. *Metagram*.—A word of four letters feeds millions of human beings. Change the first letter and it warms millions. Change the first letter again and you have a wonderful performance. Another change gives a place to rest. What are the words of the metagram?

No. 318. *Puzzle Picture*. What common mathematical instrument is represented by the above figures?

No. 319. *Puzzle Picture*.—What common mode of punishment is represented in the above picture?

No. 320. *French Puzzle*.—How do these two letters, J, a, very well describe the feelings of a hungry person?

Anecdote of General Jackson.

A widow, who resided in Washington during Jackson's administration, related the following incident to an acquaintance of the writer's. "I never knew," she began, "what it was to have a care or a worry about the future while my husband lived; but he died suddenly, leaving me poor, with several small children. I tried taking boarders. Now and then a debtor would take French leave, and forget in his hurry to ask for his little bill, and thus deprive me of the profits of a whole year's labor. One fanatic, however, a very stylish clerk in one of the departments, was kind enough to stay until he owed me more than fifty hundred dollars. He wore the finest of broadcloth, and the most expensive jewelry, and patronized me in such a grand way that I rarely had the courage to dun him. At last, the grocer nearly drove me distracted about the bill I was owing him, and I went in desperation to Mr. Jones, 'Now, really, Mrs. —,' he said, calmly looking down upon me with serene pity, 'you ought to know that this isn't the way to treat a gentleman of my standing; I—aw—fear I shall be under the necessity of leaving if I am to be annoyed about that poultry sum again.' I suppose I was a fool, but I dared not answer him, and withdrew, looking as guilty as if he had dunned me. Now, Jones often boasted at table of his intimacy with the President. He condescended to speak highly of him as a grand old hero, on cordial terms with his friend, Mr. Jones. In my distress I actually put on my bonnet and went to ask Jackson to assist me. I met with many rebuffs from porters and servants, but my courage never failed me, until, to my dismay, I found myself in the very presence of the President of the United States; then my affairs looked small enough. I felt as if I could crawl through the keyhole easier than to do such an errand, with that keen look from under Mr. Jackson's brow upon me. He saw my embarrassment and—I don't know how—soon had me telling all my troubles to him as if he had been my own son. 'Dear me!' I exclaimed at last, 'I don't know how I dared come to you, but Jones professed to be on such intimate terms with Your Excellency.' 'Ah!' he said, with a twinkle in his eye: 'then I think I must send him my autograph. He will value that.' And sitting down to his desk he wrote a few scathing lines to his friend, Mr. Jones, who wore fine clothes at a poor widow's expense, and commanded him to pay me at once, or resign his clerkship, by command of—Andrew Jackson, President of the United States of America. His autograph, indeed! Why, that Andrew Jackson crossed the entire sheet in letters as big and black as a thundercloud. When I went in to pour the tea that night, I gave Mr. Jones the note, saying, 'I called on the President to-day, and he sent you this.' 'You?' as if I had been the puppy under his feet. Then in his grand way—One of his little notes on business, probably.' But you should have seen his face before he got to that autograph; he

tried to look proud and indifferent, he tried to eat his supper, but I pitted him. He stopped after supper, laid down what money he had, humbly begged my pardon, and in a day or two brought me the whole sum. After that, all went well with me. You see, I had these words

a child who plays affectionately with its doll is cultivating a noble faculty. It is cruel to abuse dolls. They should be made to mind, but this can be done without whipping, pinching, or pulling their ears or hair. You will smile, perhaps, at the idea of cruelty to something which cannot feel; but it is cruel to yourself to indulge in cruel feelings, and try to hurt anything unnecessarily. Bad feelings will grow, and the child who begins by beating a doll will be likely to end by practising cruelty to her baby.

[COPYRIGHT SECURED.]

DON'T WAKE THE BABY. — Drawn and Engraved for the American Agriculturist.

always in my mind—'Come to me again, Mrs. —; the widow and the fatherless shall always find in me a friend.' I can assure you that I prized those parting words more, perhaps, than Jones did the President's autograph."

Don't Wake the Baby.

We hope every little girl large enough to read the *Agriculturist*, or to understand the pictures, has a doll to care for, to dress and undress, to feed, and soothe to sleep, to watch over and to love. She will learn by such pleasant play to do the same for younger brothers and sisters, and in time, perhaps, for her own dear children. It seems to be natural to put something resembling a child, for all over the world children have their dolls—be they babies. The little Indian girl loves her "pappoose" made of bark and moss, as much as you do your china or wax doll that has eyes which will move—when you pull the wire. This shows that there is something in the soul which is not satisfied without caring for the helpless. This feeling, like every other, will grow by using it, and

merchants with whom he had formerly traded, and soon succeeded in filling a strong box which he had made for the purpose, with enough, as he supposed, to make him comfortable. He then let it be known that he should present what might remain in the box at his death to the one of his children who should treat him best. It was surprising to see how attentive they all became; he was handsomely supported, and each one strove to show him the greatest kindness. Finally, he ended his days in peace. Just before his death he called his "dutiful" children about him, and declared that all had been so kind, he could not decide to whom to leave his box, and therefore directed that its contents should be equally divided among them. He was buried with much display, and immediately after the funeral the box of treasure was opened, and found to be full of common stones! This was certainly a proper reward for their selfish kindness.

CHILD'S IDEA.—While recently crossing the ferry, we heard a little three-year-old exclaim, as she saw a sailboat, "O mamma! there's a boat with a bonnet on!"

Filial Love Redeemed.

Olaf Bager was a rich and noble merchant of Denmark, who lent immense sums of money to his king, Frederick the Second. At one time when the king was paying Bager a visit, he praised the taste and sweet smell of some preserved apricots brought upon the supper table. "Wait until the dessert," replied Bager, "I will give you some incense that will please you far better." After supper a dish was brought containing perfumed cedar chips, on which was laid a mass of papers, which the king saw was the whole of the bonds he had given Bager as security for the money the latter had lent the king, and which the king had very little hope of paying, the amount was so large. "Will your Majesty light the pile?" said Bager, quietly. The king did so, and saw his enormous debt cancelled by the flames. Bager was so rich he thought he could well afford in this way to show his love for his sovereign. But in after years misfortunes came, and Bager was reduced to absolute want. In his distress he applied to his children for help. They could have easily kept him in comfort, for in his prosperous days he had established them well in business. But they treated him badly, and were anxious to be free from him as an unwelcome burden. Bager resolved to secure their good will again, and accordingly went out among the

CLOUGH REFINING CO., Cincinnati, O.

The Celebrated Walter Grape.

After twenty-five years experience with the present fender and late varieties, we know the Walter, now first offered, will restore confidence in grape raising in this country. It never fails. Its abundant crop makes it delicious on the vine. It is a great grower and bearer—the parent vine now contains 11 clusters of bloom. It is very compact in cluster at the East; this is an advantage in marketing. We have not known the foliage to mildew. It succeeds in dry and very wet soils. All grapes excel in the West. It is a seedling of the Delaware, crossed with the Diana, and better than either. It ripens before Hartford Prolific, and is therefore the earliest as well as the hardiest and best variety; No. 1 one year, \$1 each in advance. Orders filled in rotation, while supply lasts. No charge for packing. Send stamp for descriptive circular and catalogue of many vinegrapes.

FERRIS & CAYWOOD, Pontiac, Mich., N. Y.

NAPOLEON III.

The highest-flavored, most productive, and best berry for amateur culture.

In growth, flavor, and productiveness, exceeding

JUCUNDA.

Superior in size and quality to

DR. NICAISE,

as hardy, more robust, and almost as prolific as

WILSON'S ALBANY,

and in high, delicate flavor, equal to

TRIOMPH DE DIANE.

It is superior to all Strawberries we have yet seen. In its strong, luxuriant, and healthy foliage, which endures our hottest suns without burning or injury, and the vigorous, robust habit of the plant.

"One of the most distinct fruits we know, and one of the best in many respects."—Thos. Meacham, Ed. "Gardener's Monthly."

"A strong and vigorous grower; productive; promises to have an acquisition."—A. S. Foster, author of "Small Fruit Culture."

"A good bearer, large, good fruit, quite late."—F. H. Elliott, in "Horticulturist."

"In size and productiveness, it far exceeds any kind we have. Our largest berry measured 7 1/2 inches in circumference, and we had a number over 6. For a family berry it grows the most desirable quality of fruiting in a season longer than most others."—J. M. Ferry, Esq., N. Y. City.

"Found that variety superior to all others in flavor, size, and productiveness. I counted one hundred and forty-two berries, on a single stalk, that were from medium to large."—Prof. S. B. Heiges, V. Pres. York Co. (Pa.) Hort. Society.

"The best growers we have ever seen, setting fruit finely, which ripened early and continued to bear longer than any variety we had."—Geo. H. Bloeker, N. Y. City.

Descriptive Circular mailed to applicants. Price, (by mail, postage paid), \$3 per dozen.

ELWOOD J. EVANS & CO., York, Pa.

N. B.—We caution purchasers against spurious and inferior varieties, which have been sent out under this name,—prominent among them the "Austin."

Romeyn's Strawberry Seedling.

The great features of this new Strawberry are: The vigor and hardiness of the plant; the unequalled abundance of the yield; the large size, fine flavor, and solidity of the fruit; and the lateness of the fruit maturing—being two weeks later than the "Wilson."

TO PRODUCERS.—The first and second week of July, instant, this berry commanded from 45 to 50 cents a quart, in the New York market, through our agents, Young & Smith, 101 Barclay-st.

PRICE.—\$3 for 12; \$4 for 24; \$10 for 100; \$15 for 1,000. Delivered August 1st, For Plant or Depot, address WILLIAM H. ROMEYN, or JOSEPH FOSTER, Agent, Kingston, N. Y.

The Great European Strawberry.

"Dr. Nicaise."

We have fitted this variety this season, and it nearly comes up to its European reputation in size. Some of the berries exhibited at the "Fruit Growers' Convention of Western New York," and others produced since then, weighed from 1 1/2 to 1 3/4 ounces, and measured from 7 1/2 to 8 inches in circumference.

We will have a large stock of this Mammoth variety, which will be ready for Fall setting in September, and at reduced rates. Send in order for descriptive Fruit Catalogue, containing description and prices. Address

FRIEST & CO., Geeseville Valley Nurseries, Rochester, N. Y.

STEPHEN HOYT & SONS,

New Canaan, Conn.

Offer to the Trade for the fall of 1888, a large nursery stock, consisting in part of Apple and Peach trees; Clarke, Philadelphia, Brinkley's Orange, Elm City, and Deloit's Black Cherry; Early Wilson, Kittatony, Lawton, and Missouri Mammoth Blackberries; Concord, Hartford Prolific, Delaware, Diana, Diana and Archela grape vines, Apple seedlings, limes, one and two year old. We invite correspondence, or better, personal examination of our stock. Sample sent by mail or Express when desired.

To Agricultural Societies.

• Diplomas for prizes of beautiful and appropriate designs, plain or in colors, can be had in any quantities of THE MAJOR & KNAPP Engraving, Mfg. & Lith. Co., 1 Broadway, New York.

CLARKE, Naomi, Burlington, and Philadelphia Raspberry, Early Kittatony, Early Philadelphia Raspberry plants; Roses, Evergreens, &c. MAHON MOON, Morrisville, Bucks Co., Pa.

Bloomington Nursery.

17th Year; 400 Acres; 10 Green-houses.

For the Fall Trade we offer much the largest and fullest assortment ever offered West.

Apple, Pear, Cherry—Standard and Dwarf. Peach and Plum—Standard and Dwarf.

Tree Fruit—Over 30 acres, 1 to 3 years, of nearly all the old and new kinds.

Small Fruits.—Choice new, as Kittatony and Wilson's Early Blackberries, Clarke, Thornless, Elliptical Raspberries, Jacobina Strawberry, &c.

Evergreen and Forest Trees of all sizes.—Orange Orange Fruit Plants—Apple and other Fruit Tree Stocks. Yearling Saplings or standard trees, in all varieties, &c., exactly right for neat and cheap transportation to distant markets, if need be, by Express.

Prices, largest and fullest assortment we know of—nearly all on our roots.

Shrubs, Creepers, Hardy Dahls, for Fall planting. Send for Catalogues, Wholesale and Retail. Descriptive, and Plant Catalogues.

F. K. PHENIX,

Bloomington Nursery, McLean Co., Ill.

THE AMERICAN PRESERVING POWDERS

Will preserve all kinds of fruit, etc., without air-tightening the jars, and with or without sugar.

The cheapest and best method known. One package will preserve 30 lbs. fruit. Price, 50 cts. Sent by mail for 75 cts.

General Agent, No. 165 Chambers St., N. Y. City.

DO NOT FORGET

to send for J. H. Foster's new price list of plants before purchasing elsewhere. Prices not as yet (July 1st) established. Will be very low and method known.

J. H. FOSTER, name of P. O. changed to Kirkwood, Camden Co., N. J.

New Grapes and Strawberries.

For that wish to cultivate the best Grapes, Strawberries, and other Nursery stock, should send two three-cent stamps for Mr. Cline's Descriptive Catalogue of 16 pages. It shows printed cuts of Strawberries and Grapes.

J. L. CLINE, Rochester, N. Y.

AMERICAN AND IMPORTED

Seed Wheat and Grass Seed

FOR SALE.

Send for a circular giving descriptions and prices of the best varieties of American and European Seed Wheat and Grass seeds.

N. P. ROYER & CO., Parkersburg, Chester Co., Pa.

CATALOGUES SENT FREE.

M. O'KEEFE, SON & CO.,

Importers and Growers, Wholesale and Retail Dealers in Flower and Vegetable Seeds, Dutch Bulbs, Fruit Plants, Ornamental

Shrubs, Roses, &c. Ellwanger & Barry's Block. Rochester, N. Y.

Seed Wheat.

The subscriber offers for sale Red Mediterranean Seed Wheat, three and four years from the imported seed. Price Five Dollars per bushel. This wheat does not yield well before the third year.

CHARLES W. FAYNE, Sag Harbor, Long Island, N. Y.

GOOD FARM FOR SALE.—174 Acres, at Du Pont Station, 5 miles from Dover, Del., 2 sets of Farm

Buildings. Also good store and dwelling at Station. Land good, well fenced, 4 acres in apples, 25 in peaches, 65 in berries. At least 125 acres in the best Truck Berries, or Fruit. Address Wm. F. MCKEE, Dover, Del., or inquire at Du Pont Station.

THE VERY BEST GRAIN DRILL!

The Willoughby Patent Gum Spring Grain Drill, manufactured by F. GAIDNHART & CO., Carlisle, Pa., is believed to be far superior to any other Grain Drill manufactured in the U. S.

It possesses the double value of being perfectly adapted to stony and stumpy ground, as well as smooth and level fields. A Volute Spring and Guide is attached to the drag bar of each shovel or hoe, which enables it to pass over every obstruction without stoppage or breakage, and the process of seeding is not interrupted a moment.

There is no pin-breaking. There is no bunching of the seed. It is thoroughly well made and warranted. Retail price, \$39 per acre. The farmer who buys for the very best Grain Drill will not be disappointed in the Willoughby.

It is the cheapest, because it is a timesaving, labor-saving, and grain-saving Drill—three in one! Send for free descriptive circular.

Blake's Endless Plank Horse Power

will do more work at the same elevation than any power in the market.

Circular Cross Cut and Drag Saws with Attachments, supplied to order.

Horse's Horizontal Hay or Cotton Press, warranted capable of baling ten tons of Hay in ten hours.

Wood Splitters, Portable Hay or Cider Mills, Feed Cutters. Live reliable Agents wanted.

Manufactured by SHAW & WELLS, Buffalo, N. Y.

HUTCHINSON'S FAMILY CIDER AND WINE

MILLS at a low price enable every family to have sweet cider and pure wine. Larger sizes for Manufacturers; and

Small sizes for Families. Send for the very best Grain Cider Press, stoutest and best ever made. Send for Illustrated Circular to

PECKSKILL PLANT WORKS, Peckskill, N. Y., or Cleveland, Ohio.

RUSSELL'S PATENT FRUIT SEEDER.—For

planting grapes and stony cherries. This machine takes the seeds out of grapes without disturbing the pulp or crushing the fruit. It contains cleavage, simplicity, durability and effectiveness. Retail price \$125. Samples can be sent at Whitlock's Exhibition Rooms, 245 Broadway, N. Y. DOW & SPRAGUE, Manufacturers, Birmingham, Conn.

DARWIN'S NEW WORK.

THE VARIATION OF ANIMALS AND PLANTS UNDER DOMESTICATION.

BY

CHARLES DARWIN, M.A., F.R.S., &c.

WITH A PREFACE

TO THE

AMERICAN EDITION

BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY.

IN TWO VOLUMES.

This work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, results of in-and-in breeding, crossing, etc.

It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS; FOWLS, DUCKS, GESE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, BUD VARIATION. INHERITANCE, REVERSION OR ATAVISM, CROSSING, ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTER-BREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.

Published in two Volumes of nearly
1100 pages.

FINELY ILLUSTRATED.

SENT POST-PAID.....PRICE \$3.00.

ORANGE JUDD & CO.,

245 Broadway, New York City.

A few of the notices by the Press, of Darwin's Great Work, *The Variation of Animals and Plants under Domestication*, are here given:

Mr. Darwin is not an ordinary writer, and has not been content to expand his earlier and more general statements. His recital of curious facts is enlivened and illustrated throughout by thought; his principles and arguments everywhere rest solidly upon observed fact.

The reader is frequently led up in thought, within sight and hearing, as it were, of the very workshop of Nature. Glimpses are given of wonderful prospects, passing suggestions of thoughts almost too bold for expression, or profound analogies are embodied in illustrations which might be expanded into theories.

Every chapter is full of facts. They are the substance of the whole work. No room is lost by the theories. They serve as a system for arranging the facts, of which the book seems to contain more than could possibly be compressed into the same space, if it contained nothing else.

Messrs. Judd & Co. have done justice to the work, and credit to themselves, by the elegance and accuracy of this reprint. It is as pleasant to read as the English edition, and more convenient to handle than that, which costs twice as much. [*New York Evening Post.*]

While eminently valuable as contributions to science, these volumes will be found a source of much interest and instruction to the mere lover of nature. For example, in the case of the domestic pigeon, Mr. Darwin has described fully all the chief races, their history, the amount and nature of their differences, and the probable steps by which they have been formed. We have also the fullest discussion and information regarding domestic dogs and cats, horses and asses, pigs, cattle, sheep and goats. [*Scottish American Journal.*]

Messrs. Orange Judd & Co. have laid the public under obligation by their prompt and handsome reprint of Darwin's last work. Whether the reader agrees or not with the peculiar views of the author upon the great problems involved, there can be no two opinions of the value of these volumes as a storehouse of the results of observations concerning our domestic animals and plants, far more elaborate and complete than can elsewhere be found. We can testify also that the work is a fascinating one for perusal. [*Congregationalist & Recorder, (Boston).*]

The publishers have done a great service to science in reproducing this most recent work of Darwin's in a handsome and, for so elaborate a work, a cheap form.

He (Darwin) goes where his facts lead him, and of these he has an immense, but intelligibly arranged number; and has thus given to the breeder of animals, or the propagator of new varieties in the vegetable world, a treatise of great practical value, explaining all the laws of variation and selection that have thus far been definitely fixed. [*Newark Advertiser.*]

It is a work which will command universal attention, and will be of particular value to agriculturists, whether engaged in stock-raising only, or in the cultivation of the soil in general. [*Forney's (Phila.) Weekly Press.*]

The book presents the most remarkable collection of facts, methodically arranged, concerning our domestic animals and plants, yet brought together, and for this alone, it is of the highest value. [*(St. Louis) Journal of Agriculture.*]

Whatever may be thought of Prof. Darwin's peculiar theories, there can be no doubt that his works form a large and important addition to human knowledge. In the present volumes his theory is connected with a vast variety of interesting and important facts, which have great practical value apart from the hypothesis they are brought forward to sustain. [*Boston Transcript.*]

The work is alike adapted to the wants of the practical agriculturist, and the student of natural history. The immense collection of facts which it presents in illustration of the scientific views of the writer, are of singular interest and value, irrespective of the peculiar theory of which he is the most able and earnest advocate, and in its present form, the original expounder.

Mr. Darwin's modesty is no less remarkable than his candor. He is an example of the humility which belongs to genuine science, and is the condition of high intellectual attainments. The execution of his work is in harmony with the characteristics of his mind. Written in a style of eminent simplicity, artlessness, and sincerity, free from abstruse reasonings or pedantic refinements, it must prove singularly attractive to the lovers of nature no less than to the scientific student. [*New York Tribune.*]

NEW AND BEAUTIFUL WORK.

THE BOOK OF EVERGREENS.

BY

JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation,
Description of Varieties and their
Adaptability to Different Situations.

NOTICES BY THE PRESS:

A very complete and every way admirable treatise on the Conifers, or cone-bearing plants, is *The Book of Evergreens*. Mr. Hoopes has devoted many years of labor and attention to the beautiful class of trees treated of, and his work, which is copiously illustrated, must at once become an authority. We shall be glad also, if it induces any to a closer study of trees, and to a further ornamentation of their houses with them. [*Springfield Republican.*]

The value of this volume consists in its being both a labor of love and of duty. The author, having devoted a life to the study of trees and plants as a practical horticulturist, records here his views and experiences. Mr. Hoopes has studied all the treatises which bear on his subject, and availed himself of the assistance of many scientific friends, as well as recorded his own experience. The illustrations are numerous and excellent, and altogether the work has all the characteristics of an authority on the subject it so minutely and comprehensively treats. [*Boston Transcript.*]

It is a practical treatise on the Conifers, or cone-bearing plants, describing them in all their families, and their best culture, management, and so forth, and is well illustrated. It fills a vacant niche, and every intelligent culturist of trees should have and use it. [*Congregationalist & Recorder, (Boston).*]

The work was evidently prepared with great care and pains, and embodies the results of years of close observation and study. It is one of great value to the agriculturist and landscape gardener, and of special interest to all who care to know anything of the flora of the globe. To those who wish to raise trees, it is an indispensable hand-book. [*Liberal Christian.*]

It is undoubtedly the most complete American work of the kind in print. It is well illustrated and handsomely printed. [*Boston Journal.*]

We have examined this handsome book with a great deal of pleasure and satisfaction. The author has pursued a very desirable plan in his work, giving sufficient scientific information to meet the wants of the botanical student, and yet the work is sufficiently elementary in explaining terms and points about plant structure, and systems of classification, in short, plain enough to meet the wants of every reader. It is printed in neat style, with thick covers and beveled edges, and a large number of very superior illustrations. [*Journal of Agriculture.*]

The work is now ready. 435 pp., 12mo, on fine paper.
SENT POST-PAID. PRICE \$3.00.

ORANGE JUDD & CO.,
245 Broadway, New York.

ENDLESS AMUSEMENT

FOR

BOYS AND GIRLS.

Crandall's Improved Building Blocks, which have been described in a former number of the *American Agriculturist*, furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily.

CHURCHES,

DWELLINGS,

BARNs,

MILLS,

FENCES,

FURNITURE, etc.,

in almost endless variety, can be built with them, and when finished, the structure remains firm so that it can be carried about without falling to pieces.

For developing the ingenuity and taste of children they are unequalled. Having given these blocks a practical trial in their own families, the publishers of the *Agriculturist* were so well pleased with them, that they consented to take the general agency for their sale. In offering them to parents for the instruction and amusement of their children, we feel that we are doing them a service which cannot be fully appreciated until they have seen the blocks in their wonderful combinations, affording a beautiful and lasting toy to the prattling infant, and serving as a delightful study and pastime for the older ones of the family.

The Blocks are put up in neat boxes, each box containing a set, and a card giving various designs of buildings. Price per set: Plain, No. 1, \$2.00; No. 2, \$1.50; No. 3, \$1.00. Extra, Maple Finish, No. 1, \$3.50; No. 2, \$2.00; No. 3, \$1.50. A liberal discount will be made to dealers. Address

HAS THE ONLY

SEED WHEAT EXPERIMENTAL FARM

IN THE UNITED STATES,

Where the Foreign Seed Wheats are acclimated and grown for sale, near Chambersburg, Pa. 4 pounds of any variety sent post-paid for One Dollar, one head of any variety sent post-paid for 10 cents, or 20 heads of different varieties for One Dollar.

FRENCH WHITE CHAFF MEDITERRANEAN.

Per peck, \$2.00; per bushel, \$7.50. Wholesale, or Club rates: 25 bushels, \$175.00; 50 bushels, \$325.00; 100 bushels, \$500.00.

FRENCH WHITE CHAFF MEDITERRANEAN.

Bearded Wheat.—Imported from Arles, France. Acclimated four years. This Wheat I consider the best Red Wheat for general cultivation. It is the earliest, hardiest, and most prolific Red Wheat that I know of, and has a very stiff straw, a large head, and the largest grain of any wheat in the country. As yet it has proved rust and weevil-proof, and yields from forty to fifty bushels per acre.

Per peck, \$2.00; per bushel, \$7.50; Wholesale, or Club rates: 25 bushels, \$175; 50 bushels, \$325.00; 100 bushels, \$500.00.

FRENCH RED CHAFF MEDITERRANEAN.

From Aix, France.—Acclimated four years. This is also a very good early Wheat. It stands the Winter well, and is very prolific. The grain is a light red or amber; is of good size, and very plump. The head is the largest of any of the Bearded Wheats. The straw is strong and stiff; not liable to lodge. It yields about forty to fifty bushels per acre on ordinary soil, and is free from rust and weevil.

Per peck, \$2.50; per bushel, \$7.50. Wholesale, or Club rates: 25 bushels, \$175.00; 50 bushels, \$325.00; 100 bushels, \$500.00.

HUNGARIAN RED MEDITERRANEAN.

Bearded.—Imported from Dantsic, Prussia. Acclimated two years. An early and prolific Red Wheat which stands the hardest winter, and stools very heavily. The head is of a good size, the grain medium and of a dark red color. It has improved both in straw and grain each year. I consider it a very good and hardy Wheat.

Per peck, \$2.00; per bushel, \$7.50; Wholesale, and Club rates: 20 bushels, \$140.00; 40 bushels, \$280.00; 60 bushels, \$360.00.

GERMAN RED.

Beardless.—From Holland. This is a smooth Wheat, with a head of good size and medium sized grain of a light red or amber color. It is hardy and prolific, free from weevil and rust, and yields about forty bushels per acre.

Per peck, \$1.50; per bushel, \$7.50. Wholesale, or Club rates: 25 bushels, \$175.00; 50 bushels, \$325.00; 100 bushels, \$500.00.

RED CHAFF MEDITERRANEAN.

Bearded.—This Wheat was imported at the same time with the White Chaff Mediterranean, and from near the same place. The only difference between the two Wheats is, that this Wheat has a dark red grain of large size; a straw slightly purple, and a red chaff. It has been yielding good crops every season, is hardy and prolific, and will stand the hardest winter. It yields about thirty-five bushels per acre.

Per peck, \$1.50; per bushel, \$5.00. Wholesale, and Club rates: 25 bushels, \$112.50; 50 bushels, \$225.00; 100 bushels, \$400.00.

SEND FOR A CIRCULAR. IT IS SENT FREE.

FOREIGN WHEATS IMPORTED THIS YEAR.

ANCONA RED, per peck, \$2.75; per bushel, \$10.00.
SANDONICA WHITE, per peck, \$2.75; per bushel, \$10.00.
BERDENSKA, per peck, \$2.75; per bushel, \$10.00.
SAKONKA, per peck, \$2.75; per bushel, \$10.00.

FOREIGN WHEATS.

ANCONA RED.—From Prussia.—Imported this season.

SANDONICA WHITE.—From Poland.—Imported this season.

BERDENSKA.—From Russia.—Imported this season.

SAKONKA.—From Poland.—Imported this season.

SALLA.—From Saxony.—Imported this season.

SAXONY.—From Saxony.—Imported this season.

BOHEMIAN RED.—Imported this season.

BOHEMIAN WHITE.—Imported this season.

WHITE CHAFF MEDITERRANEAN.

Bearded.—This Amber Wheat was imported ten years ago from the Northern part of Italy, near the coast of the Mediterranean Sea, and has been yielding good crops every season. This Wheat is grown in New York, largely. It is a hardy and prolific Wheat, amber colored grain, of good size, and a medium sized head. It yields from thirty to thirty-five bushels per acre. It stools largely, and the straw is bright and strong; free from rust, and weevil do not trouble it.

Per peck, \$1.50; per bushel, \$5.00; Wholesale, and Club rates: 25 bushels, \$112.50; 50 bushels, \$225.00; 100 bushels, \$400.00.

ROCHESTER RED CHAFF.

Bearded.—From Rochester, New York. This wheat is somewhat similar to the Lancaster Red Mediterranean, with a more perfect and fuller head, and ripens about the same time. It makes a stiff straw—stands the most rigorous winter, and is weevil and rust-proof.

Per peck, \$1.50; per bushel, \$5.00; Wholesale, and Club rates: 25 bushels, \$112.00; 50 bushels, \$225.00; 100 bushels, \$400.00.

EGYPTIAN RED CHAFF MEDITERRANEAN.

Bearded.—This Wheat is similar to the Lancaster and Rochester, raised along the banks of the Susquehanna river. The head is a good size; the grain medium, and yields from thirty to thirty-five bushels per acre. In this vicinity, this variety proves late, but in some localities it is very superior and gives entire satisfaction.

Per peck, \$1.50; per bushel, \$5.00. Wholesale, or Club rates: 25 bushels, \$112.00; 50 bushels, \$215.00; 100 bushels, \$400.00.

LANCASTER RED CHAFF.

Bearded.—An early red Mediterranean Wheat. Head medium size; grain a light red, of good size. Pennsylvania farmers hold it on account of its making a crop on all kinds of soil, especially in slate or gravelly land, and its making a part of a crop in all kinds of seasons. If the best seed was taken every year for sowing, it could be improved so as to make a splendid Wheat. The yield, in this Valley, is from fifteen to thirty-five bushels per acre.

Per peck, \$1.50; per bushel, \$5.00. Wholesale, or Club rates: 25 bushels, \$112.00; 50 bushels, \$212.00; 100 bushels, \$400.00.

The money must accompany all orders. Send the money by money orders or Registered letters, or by any Express. On amounts over One Hundred Dollars, will pay expressage.

If you want the Best and Hardest varieties of Wheat, send to GEO. A. DEITZ, Chambersburg, Pennsylvania, who will send 4 pounds, post-paid, for One Dollar, to any part of the United States.

ITALIAN WHITE WHEAT.

Smooth.—From Tuscany, Italy. This White Wheat will not stand our cold northern winter. I had to plow it down as it was winter-killed. Where it has been sown in this Valley it has deteriorated every year. It is one of the finest and largest White Wheats in the world, and those who live in a warm and dry climate can raise it to perfection. It will yield about 50 bushels per acre.

Per peck, \$2.00; per bushel, \$7.50.

CALIFORNIA WHITE WHEAT.

Smooth.—Originally from Chili. This is considered one of the very best White Wheats, but it needs a warm, dry climate to grow it to perfection. I plowed most of it down this season—being winter-killed. Some of it, left standing, has made fine heads of a very large size. I only offer this Wheat to those who think they can raise it, as it is one of the finest White Wheats in the world. It will not stand our wet, northern winters. Yields from fifty to sixty bushels per acre.

Per peck, \$1.50; per bushel, \$5.00.

ITALIAN RED MEDITERRANEAN.

From Tuscany.—Acclimated one year; half hardy. This is the same Wheat as that acclimated three years, and I expect to do as well.

Per peck, \$2.00; per bushel, \$7.50; Wholesale, or Club rates: 25 bushels, \$190.00; 40 bushels, \$300.00.

AMERICAN WHITE WHEAT.

Bearded.—This is a fine and hardy White Wheat, with heads and grain of good size. It originated in the northern part of Pennsylvania, where it has been doing well for eight years and been yielding good crops.

Per peck, \$2.00; per bushel, \$6.00.

HALLETT'S ENGLISH WHITE MEDITERRANEAN.

Raised by Mr. Hallett, of Brighton, England. A white, smooth, bearded Wheat; grain very large and plump; straw strong and head large—containing from forty to eighty grains each.

Per peck, \$2.35; per bushel, \$8.00; Wholesale, per bushel, \$7.00.

HALLETT'S ENGLISH RED MEDITERRANEAN.

Smooth.—Raised from selected seed, by Mr. Hallett, of Brighton, England. Grain very large and plump, dark amber color; makes a very strong straw and very large head, containing from fifty to eighty grains each.

Per peck, \$2.75; per bushel, \$9.00; Wholesale, per bushel, \$7.00.

BLUE STEM WHITE.

Smooth.—From North Carolina. The head is a good size; the grain white and plump;

the straw stiff and of a good length. It ripens about as early as the Boughton White Wheat, and yields from thirty to forty bushels per acre. This Wheat stands very strongly, and will stand more freezing and thawing than most other varieties, as it sends out a great mass of roots. It would be a good Wheat for loose and prairie soils.

Per peck, \$1.50; per bushel, \$5.00; Wholesale, and Club rates: 25 bushels, \$112.50; 50 bushels, \$225.00; 100 bushels, \$400.00.

BOUGHTON, or TAPPANANNOCK WHITE.

good stiff straw, and is fly, weevil and rust proof. I believe this Wheat would prove hardy and prolific in any part of the United States, as a crop can be raised on any kind of soil.

Per peck, \$1.75; per bushel, \$6.00. Wholesale, and Club rates: 25 bushels, \$150.00; 50 bushels, \$300.00; 100 bushels, \$500.00.

BRAMA POOTRA FOWLS.

AYRSHIRE AND ALDERNEY CATTLE.

CHESTER WHITE HOGS FOR SALE.

ITALIAN RED MEDITERRANEAN.

Bearded—Imported from Tuscany. Acclimated three years. It is a hardy amber Wheat, with a grain of good size, and has improved each year. The head is as large as that of the French Red Chaff Mediterranean, and is very prolific. The straw is very strong and stiff, not likely to lodge, and has not been affected by rust or weevil. It yields from forty to fifty bushels per acre.

Per peck, \$2.00; per bushel, \$7.50; Wholesale, and Club rates: 25 bushels, \$175.00; 50 bushels, \$325.00; 100 bushels, \$500.00.

ROGER'S ENGLISH RED MEDITERRANEAN.

Smooth.—Raised from selected English seed. Grain large, and of an amber color; heads of a good size; straw stiff and of good height. I think it will make a good Wheat when well acclimated, as it is doing better each year.

Per peck, \$2.35; per bushel, \$8.00.

DIEHL'S WHITE.

Smooth.—This variety originated in the State of New York, and comes up as fully to the requirements of Wheat growers as any Smooth White Wheat grown. It has proved uniformly hardy. The grain is white, plump, soft, and not flinty, and ripens early in the season. It is very prolific; the plant is very strong and broad-leaved; stools well, and endures the rigors of our northern winter as well as any other known variety. The grains set close to the rachis, and the glume, or chaff, lies closely, and may be called fly-proof. On good ground it will yield over forty bushels per acre.

Per peck, \$1.50; per bushel, \$5.00. Wholesale, for Club rates: 25 bushels, \$125.00; 50 bushels, \$250.00; 100 bushels, \$500.00.

BOUGHTON, or TAPPANANNOCK WHITE.

Smooth.—From Virginia. This wheat has proved one of the best White Smooth Wheats in this part of the country. It ripens early and yields from thirty to forty bushels per acre; the head and grain of good size. This Wheat, in some localities, will ripen earlier and yield better than in others. It needs a good, rich, warm, dry soil, and on such soil will repay the farmer well for sowing. When grown to perfection, I consider it one of the best White Wheats in the country.

Per peck, \$1.50; per bushel, \$5.00; Wholesale, and Club rates: 25 bushels, \$125.00; 50 bushels, \$225.00; 100 bushels, \$400.00.

WEEK'S WHITE BEARDED.

This Wheat was found in a crop of Mediterranean Wheat by Mr. WEEKS, of New York, and is believed to be a hybrid from the Sonles and Mediterranean Wheat. This is the earliest bearded White Wheat I know of. It is hardy and prolific, with a hard and flinty grain, similar in size and shape to the Mediterranean; yields as high as forty-five bushels per acre. It has a

BOUGHTON, or TAPPANANNOCK WHITE.

good stiff straw, and is fly, weevil and rust proof. I believe this Wheat would prove hardy and prolific in any part of the United States, as a crop can be raised on any kind of soil.

Per peck, \$1.75; per bushel, \$6.00. Wholesale, and Club rates: 25 bushels, \$150.00; 50 bushels, \$300.00; 100 bushels, \$500.00.

WILLOUGHY GUN SPRING AND TUBE DRILL.

I have the Best and Strongest Grain Drill in the World, for sale. Price One Hundred Dollars. With Guano Attachment, \$140.00. This is the only Grain Drill that sows regular over rocky and stumpy ground, without breaking.

TEN VARIETIES of Field and Table Corn: Surprise, New Brunswick, Swedish, and Black Norway Oats; Timothy Seed; Alsike; Cow Grass; Saintfoin; Lucern, and Red Clover Seed. Early Rose, Early June, Early Goodrich, Harison, and other good varieties of Potatoes for sale.

ALL YOUNG PERSONS can obtain a good Education. For particulars address
J. A. COOPER,
Edinboro, Erie Co., Pa.

New and Valuable Books.

Benedicite;

Illustrations of the Power, Wisdom, and Goodness of God, as Manifested in His Works.

By G. CHAPLIN CHILD, M. D.

FARMING FOR BOYS;

What they have done, and what others may do, in the Cultivation of Farm and Garden, how to begin, how to proceed, and what to aim at. By the Author of "Ten Acres Enough." Beautifully illustrated, \$1.50.

This charming and useful little book ought to be in every home. It is a delightful combination of story and of suggestions for making farming profitable and pleasant. It is just the book for boys who are ambitious to improve the farm, and to give a healthy taste for farm life to those who have never appreciated its attractions and are studying to escape from it.

"It has all the charms of reality that makes Robinson Crusoe so fascinating for young folks, and few boys will read it without making up their mind—at least for the time—to be farmers."—*Trenton Gazette*.

"FARMING FOR BOYS" is an enchanting book, full of practical hints on farming, and as quaint and interesting as Isaac Walton's book on trout fishing."—*Church Union*.

* For sale by all Booksellers. Sent post-paid, on receipt of price, by the Publishers,

TICKNOR & FIELDS, Boston.

HOP PICKING.—*Drawn and Engraved for the American Agriculturist.*

The little poetry which attached to our general harvests is well-nigh dispelled by the introduction of machinery. The harvest loses its busy appearance when a machine takes the place of men and women, and the iron click of the reaper is not as pleasing to the ear as the voices of the workers. Machines have not yet entered the hop-yard, and the harvest there is gathered by nimble fingers to the accompaniment of equally nimble tongues. The hop harvest usually occurs early in September, the time varying with the season. When the seeds of the hop become brown and ripe, and the scales, on breaking open, show a plentiful dusting of golden yellow grains, then the picking

begins, and is pushed as rapidly as possible. Women and children find light and pleasant work in picking the hops into boxes or bins, while the men find sufficient occupation in bringing the vines to the pickers, and taking the hops away to the drying kilns. Various forms of picking boxes are used; those of the kind shown in the engraving are of about the capacity of thirty bushels, and their contents will make about one hundred and thirty pounds when dried. Two experienced pickers will fill three or four such boxes in a day. An expert picker will take from five to ten hops at a time, close the hand lightly, and by a quick pull bring them off clean. It is the duty of the foreman to see

that the hops are picked free from stems and leaves, and when the work is not done by the day, to keep an account of the quantity picked by the several hands. The hops, as fast as they accumulate, are conveyed to the kiln, one form of which is shown in the distance in the engraving, where they are dried by means of hot air. Hops, instead of being trained upon poles, are often grown upon horizontal cords or wires, a plan for which great superiority is claimed. A yard, in which the vines were trained horizontally, could not afford the artist an opportunity for such a picturesque sketch as he has given of the older and more common hop-yard, in which the vines are trained upon poles.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrotype plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 26, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, SEPTEMBER, 1868.

We approach the autumn harvests with great hope and no little solicitude. Early frosts may cut short our most important cereal crop, and greatly injure the quality of corn fodder, which is annually becoming more and more a dependence, as it is better economized. September will settle the fate of the great corn crop, and if the hopes and prayers are answered, the harvest will be abundant for home needs at any rate. The great abundance of hay, and the excellent condition in which it was gotten in over a large portion of the Atlantic States, may lead to a neglect of the corn fodder. This should not be, for the drought in England is reported as having been severe, and the hay crop so short that large orders have been filled for shipment of this article. The powerful presses, now not uncommon, make it possible to load a ship heavily with hay, which, until recently, we have never been able to do. So prices may yet rule high, and farmers may be very willing to supplement their hay with good corn fodder. Make it a rule, if hay be sold, to spend all the money for manure.

Many agricultural fairs occur this month. Too many important ones interfere with one another, being held upon the same days. Cannot this be obviated? Every fair ought to be patronized and visited, and it should be a matter of conscience with every farmer, horticulturist, and producer of anything of value, to show his best products somewhere, at the State and County fairs if possible, and with wife and children have one pleasant holiday, at least, in visiting the fair and cattle show.

Hints about Work.

September work is ordinarily not of a very pressing kind. It requires good judgment to know what should be first done of several things, all requiring attention, but, unlike the labors of the spring and summer, a few days' delay will not be certainly disastrous, or entail additional labor.

Buckwheat ought to be in full blossom over the northern half of the Union; a frost of moderate severity is destructive to all but the well-grown kernels, and may cut off half or two-thirds of the crop. The succulent stalks and leaves will furnish sap to mature a great part of the grain which has passed the bloom. If a change of weather threatens frost, it is best to cut buckwheat at any rate, and after partial drying, it should be laid up in small cocks, or gavels, bound at the top so as to shed rain, and so left until all the kernels have filled and ripened that will do so.

Corn.—The corn crop over a large portion of the Union is backward. It is folly to top it, to promote its ripening. It is not the sun on the ears that ripens corn, but the effects of light and air upon the leaves and entire plant. After the kernels are well glazed at the tips of the ears, it may pay to top the large, coarse kinds, in order to secure a better quality of fodder. We prefer, however, to cut at the ground, and stook up as soon as thoroughly glazed. The grain will ripen, the stalks make better fodder, and the heavy butts, if not used for fodder, are easily made available in the compost heap, and worth more than if left in the field.

Corn for Seed should be selected personally before the stalks are cut up. Go through the best part of the field, marking the ears on the most prolific stalks, and choosing the ears which please you best on the stalks which are of medium size and not given to suckering. Mark by a string tied around the middle of the ear. At husking time all these ears will be saved by themselves, and out of them, when the husks are stripped back, one can select the most perfect. Mark two or three times as many as you will need.

Tobacco is hopelessly damaged by a light frost. That which still stands should be cut early in the month. In hanging avoid crowding, as much as in hot weather; though as soon as the plants have partially dried, they may be moved quite near to-

gether. That cut in August may be crowded up to make more room for the rest of the crop.

Potatoes.—The death of the tops indicates the maturity of the tubers. If the rot be amongst them, we hold it better to let them rot in the ground than in the cellar or pit. Many, however, dig and market at once. If consumed before the disease makes progress, a larger portion of the crop may be thus utilized. When other work does not press, early potatoes should be dug and put in cool cellars, or in pits in perfectly dry soil.

Root Crops.—After cool weather sets in, roots make their chief growth. Weeds should be pulled or hoed up, so as not to disturb the roots. Thinning may also be done effectively. The plants removed will be relished by the stock. Carrots require that the ground between the rows should be kept loose and open, more than other roots.

Grass—Aftermath.—If a rowen crop is taken, by all means manure well after it. It often pays to cut the aftermath for the sake of removing a crop of weed seeds, like wild carrots, for instance, even though it would hardly pay to cut for hay alone.

Pasturing the Aftermath.—Nearly or quite half the feed is destroyed by the trampling of the stock. This is all avoided by tethering in the way described on page 327. If the tether is fastened to an hind leg, and the stakes moved forward six feet at a time, the droppings will be left on the fed off portion.

Seeding Down to Grass may be done any time during this month. Put the surface in good order; spread a fine compost or some guano; harrow in well and even; pick off all the stones; sow grass seed, with clover, if you please, and roll. Grass sowing may be delayed until spring. Three pecks to a bushel of oats may be sown as a mulch. See article on Seeding Lawns in Autumn, page 323.

New Grass Land and seeded stubble should not be pastured too soon, if at all. Calves, yearlings, and weaned colts, do little harm, for they neither poach it up in rainy weather, nor pull much up by the roots, as heavier cattle are apt to do. Go over such land and cut the rag-weed, carrots, and other weeds, before the seeds are ripe. Once mowing is usually sufficient, and it is light, easy work for boys.

Wheat.—The earlier sowed, the better, as a general rule. It makes a little difference at harvest time, and but a little, but it is so much clear gain. The better the land is in, the better will the wheat be. An excellent compost for wheat and substitute for Peruvian guano is bone-dust and fish guano, equal parts, with two or three times as much fine manure or rotted sods. Another is bone-dust two parts, castor pomace one part, composted with manure in like manner, spread after it has undergone one good heating, and harrowed in with the grain. All manure applied directly for a grain crop should be put on as a top-dressing.

Pickles for Seed Wheat.—Smut in wheat is to a very great degree prevented by soaking the seed in a strong brine previous to sowing. The smut is a parasitic plant, which attacks and entirely destroys the head of the wheat. It propagates itself by invisible spores, which attach themselves to the grain, remain upon it, and are sown with it if not destroyed. This is proved by the fact that pickling the seed is a remedy for the disease. A strong brine is efficient; many suppose they improve its efficacy by adding blue vitriol, and others that it is essential to dry off with dry-slaked lime. In the absence of proof that the blue vitriol and lime do no good, and as the former is but a slight expense, and the use of the lime a great convenience, we advise to make a brine that will float an egg; add two pounds blue vitriol to the half barrel of brine; wet a bushel of wheat at a time, stirring it thoroughly, and skimming off the light stuff as the wheat is poured into the brine; after ten minutes, dip out the wheat, and letting it drain thoroughly, throw it into a pile on a floor, and when all is done, sprinkle with dry, powdery lime, shoveling it over until dry enough to sow. This may be done 24 to 36 hours before sowing.

Hay and Grain Stacks.—Brace them up if they settle unevenly and incline much. If need be, re-

top them. Spots on large stacks which sag down and do not shed rain may be built up even, by simply laying on hay or straw, and then pinning on a thatch, using hooked or pronged sticks as pins.

Sorghum.—The sorghum crop is, according to the reports we have, small. It is the more important to make the best use of it. The use of Clough's method of clarifying enables farmers to produce marketable syrup at once, which will eventually add greatly to the wealth of the country.

Draining.—Deepen and clean out open ditches in low land, beginning at the outlet and making the water follow back, thus securing the greatest possible depth. In laying tile or stone drains, remember to make the bed of a true grade, and the soil for a foot or more above the drain as impervious to water as possible, covering the joints, putting in clay or the stiffest soil you can get, and ramming it hard. This secures permanency, as well as efficiency.

Soiling Crops.—Sow wheat and rye for soiling in the spring. Make two sowings, a month or six weeks apart, the first sowing to be between the first and middle of September, the other about the middle of October; at each time sow a patch of wheat and a patch of rye. The rye will be fit to cut first, one patch will follow the other, and then the first wheat will come in cutting condition. Land used for soiling crops should be thoroughly enriched by either yard manure, guano, or stimulating manure of some kind.

Stock require no special attention at this season, except that constant care that all their wants are supplied which they should always have. Animals to be fattened this fall should have slightly increased feed, as the time approaches when the harvesting of corn gives a supply of immature ears and nubbins, which are first to be fed out. If old corn is at hand have it ground, and use it moderately before and after the nubbins come. Give cows that are to be milked through the winter the choice of the pastures, and feed a little (more or less) oil-cake daily, to keep the flow of milk profitably large.

Manure.—The season is favorable for increasing the manure and compost heaps by all sorts of vegetable matter,—potato tops, weeds, swale-grass, reeds, and rushes. Use no weeds the seeds of which are ripe, or will ripen, and follow directions in previous numbers in regard to composting, etc.

Commercial Fertilizers.—Peruvian guano will pay applied broadcast and harrowed in before sowing wheat. Use about 200 lbs. per acre. It may be mixed with its weight, or three times its weight, of plaster, usually with marked benefit. At the South, they use equal parts Peruvian and Swan Island, or some good phosphatic guano, which supplies the place of the gypsum and adds phosphoric acid. Fish manure and bone-dust, applied at the rate of about 400 lbs. of each, is a good substitute. Bone-dust is an excellent application to pastures at this season. Mix with equal parts good lively wood-ashes, pound the mixture solid, or moisten slightly, and after lying a week shovel over on a floor, and break any caked lumps before sowing.

Ivies.—Mow and burn wherever found, if they have matured their seeds, clearing up the fence rows and sheltered places, as well as open grounds.

Work in the Horticultural Departments.

Ripeness is the characteristic of the month; not only do fruits mature, but the new wood ripens. Autumnal flowers bloom in the borders, and the cool nights and warm days are particularly congenial to the growth of the later crops of the kitchen garden. It is the month of fairs and pomological gatherings. Go to your nearest fair, as a matter of duty, and take such fruits, flowers, and vegetables, as you have. Let premium taking be the second thing in your thoughts—helping make a creditable display, the first. The home fair being attended to, visit as many others as possible. One is always sure to learn something, if not from examples, at least from warnings. If the neighborhood warrant it, have a fruit club, or its scope may be extended to include all branches of

horticulture, and now is the time to found one. Have some way of getting the neighbors together to tell experiences and rub off the rust that always accumulates upon those who plod along by themselves.

Orchard and Nursery.

Autumn Planting of trees is best where there is likely to be a long, mild autumn, but where the winter shuts down suddenly, it is better to plant in spring. Next month the trees will be ready to remove from the nursery, and the ground should be prepared for their reception. A deep, well-drained, but not over-rich soil is best. Plow and subsoil, and if possible make the whole piece intended for the orchard so well prepared that a tree will grow in one place as well as in another.

Selecting and Ordering.—Order early, but make a well-considered selection first. Selections of best varieties for States are not always safe guides. Experience of those in the neighborhood is best, and its value decreases as the distance from which it is derived increases. Visit fruit growers, go to fairs, talk fruit with everyone who has any knowledge of the subject, and follow that advice which seems, most reliable. Do not aim at too many varieties, unless you have time and means for carrying on an experimental collection. Twelve kinds of apples or pears are enough for family use, and six are a plenty for market purposes.

Picking and Packing require care, judgment, and conscientiousness. Some hints on packing are given on page 334. Autumn fruit requires more experience in picking than that which matures later. It should be mature and yet not mellow.

Drying and Canning fruit for winter use must be attended to. We have figured some drying houses; patented ones are for sale. A spare room, with a stove in it, should be in readiness when open air drying is depended upon. The fruit can be removed to this during damp or rainy weather, and the drying go on without interruption or damage. In back numbers hints on canning various fruits are given in the Household Department.

Fallen Fruit usually contains insects. Do not allow it to decay upon the ground and thus propagate a brood for another year. Gather and feed to hogs, if these animals do not have the run of the orchard. The best use to make of fallen apples is to convert them into vinegar. Gather, grind and press as for cider, and allow the juice to ferment, with free access of air, in a warm place. The addition of the lees or mother of vinegar, or a quantity of old vinegar, will expedite the process.

Budding may continue as long as the bark of the stock will lift or "run," which it will do with peaches and quince stocks this month. Examine previous buddings and loosen the bandages if need be. Where buds failed, put in others, if not too late.

Seeds, especially of the stone-fruits, must not be allowed to get too dry. They are best preserved in sand or sandy earth, just perceptibly moist, which should be mixed in sufficient quantity to preclude drying or heating. A box in a cool and dry cellar or shed will answer as well as to follow the European plan of burying or stratifying.

Manning.—Nurserymen who raise the best trees pass between the nursery rows with a plow and turn a shallow furrow, in which a well-decomposed compost is distributed and the earth thrown back. In this way the land is kept in excellent condition.

Prune young trees, to form a proper head.

Weeds.—Let none of them ripen their seeds.

Fruit Garden.

Prepare the soil for fall planting. A rich, fine, deeply-worked soil is needed for successful fruit culture. The hints under "Orchard," apply to such trees as are grown in the fruit garden.

Pears are to be picked as fast as they mature. When fully developed, the stem will part readily from the tree. Ripen them in the house.

Blackberries.—Remove the old stems as soon as the fruit is off. See hook for this purpose on another page. Pinch the side shoots of the new growth to

about 18 inches. This will induce the wood to ripen, and prevent injury by winter-killing.

Black Caps.—If it is desired to propagate plants, the tips of the canes should be layered. The tip is to be covered with only enough earth to hold it in place and prevent it being blown about by the winds. Too deep covering is injurious.

Raspberries in garden culture are best if kept in place by some kind of trellis or support. Keep the ground clear of weeds and allow no suckers to grow, except such as are wanted for new plants.

Grapes.—Market-growers often gather the fruit as soon as it is colored and before it is fully ripe. Some varieties, like the Diana, are eatable when only partly ripe. Full maturity is shown by the stem assuming a ripe appearance and losing its stiffness, allowing the bunches to hang directly down from the vine. Use scissors in gathering, and handle the fruit as little as possible.

Strawberries.—New beds are to be kept clean, and no runners allowed to grow. Beds may be set now, taking the plants up carefully and removing all the large leaves, to prevent evaporation. Where plants have been struck in pots, this precaution is unnecessary, as the roots of the plants are scarcely disturbed by turning them out of the pots.

Kitchen Garden.

Beans.—If the Limas set more than can be used in the green state before frost, shell and dry for winter. Soaked over night before cooking, they are nearly as good as when fresh. Salt string beans.

Cabbages and Cauliflower.—Around New York the seeds for plants to be kept over winter are sown from the 10th to the 20th of this month. Sow Wakefield, Early York, or other early cabbage, and Erfurt or other early cauliflower, in well-prepared seed-beds, in the open ground. Keep the soil stirred among the late crops.—Spunkle lime if troubled with slugs—ducks will destroy them.

Borcole or Kale for spring greens or "sprouts" is sown this month, in drills a foot apart. The kind called German Greens is the hardiest.

Corn.—Continue to dry for winter use. See article on page 263, July, on salting green corn.

Cucumbers.—Go over the vines at least every two days and gather for pickles; remove the overgrown.

Celery.—Continue to earth up for blanching. That grown in flat culture, i. e. not in trenches, requires to be earthed up about ten days before it is blanched sufficiently for use. The main winter crop is not earthed up until later in the season.

Endive.—Blanch as directed last month.

Manure.—The compost heaps should now grow rapidly from the addition of garden refuse. All but very young weeds should be dried and burned.

Melons.—Young fruit that will not ripen is to be picked and used for stuffed pickles or mangoes.

Onions.—See that those stored are so thinly spread that they will not become heated. Take up sets, if not already done, and spread in thin layers in a cool, dry loft. The same with top onions.

Radishes.—Winter sorts may be sown early in the month, with a prospect of a fair crop.

Shallots.—This is a species of onion which is multiplied by dividing the clusters of small bulbs. Set single bulbs six inches apart, in rows a foot asunder. It is hardy, and gives in spring what are usually sold as young onions. The flavor is much stronger than that of the onion.

Spinach.—Sow for the winter crop before the middle of the month, in rows 12 or 15 inches apart. Thin and weed the young plants when large enough.

Sweet Potatoes.—Some of the larger roots may be taken by carefully removing the earth from the ridges, and the smaller ones left to grow as long as frost will let them. Dig with the first frost.

Tomatoes will still be infested by the "worm," and will need to be looked over occasionally. Preserve and make catsup while the fruit is plenty and better than it is later in the season.

Turnips.—The Ruta-bagas or Swedes will need

good culture until the size of the leaves prevents working among them. Sow round turnips.

Winter Cherry, or Physalis.—The fruit of this, preserved, makes a strawberry-flavored sweetmeat, much liked by many. The fruit, left in its buds, will keep for some months, if spread in a dry place.

Flower Garden and Lawn.

Bulbs.—The hardy bulbs, such as hyacinths, tulips, crocuses, etc., that were taken up, may be planted the last of this month, or early in October. Purchase as soon as the dealers receive their stock.

Perennials.—Those which complete their growth early, such as *Diantra*, may be divided and reset, if the plants are large enough to require it. The seeds of many perennials, if sown now, will make plants large enough to pass the winter.

House Plants that have been turned out should be taken up and reported before there is danger of frost. Keep them shaded until they recover, but do not take them into the house until cool weather.

Chrysanthemums.—Have them properly staked. The bloom of the tall-growing kinds is so heavy, especially when wet by the rains, that they are apt to be broken down. Those intended for blooming indoors are to be potted when the buds are well developed. They will wilt at first, but with a few days' shading and watering will recover.

Dahlia.—Autumn storms will prostrate these just as they are in their best, if they are not carefully staked and tied. Pick off withers that have passed their prime as well as misshapen buds.

Violas.—Prepare for forcing by setting the plants in fine rich soil in a cold frame, which is not to be covered until frosty weather.

Pits for wintering half hardy plants should be made ready. They should be well drained and at the same time secure from the entrance of rats and mice.

Green and Hot-Houses.

Get through with repairs to the houses and heating apparatus, and have all ready to receive the plants if sudden cold weather should make it necessary to take them in early.

Cuttings may be made from those bedding plants of which a stock to keep over winter is desired.

Seeds of such annuals as are desired for early winter blooming may be sown. Candytuft and nigella are always in demand for bouquets.

Hanging Baskets may be started. Ivy is the basis and should be used in abundance.

Cape Bells may be potted, as may hyacinths, &c. It is best to plunge the pots in a dry place and cover with earth until cool weather, when they may be removed to the dwelling or green-house.

Plants in Pots, that are out of doors, must not be allowed to get too dry. See that they are not thrown over and broken by heavy autumnal gales.

Cold Grapery.

The fruit is apt to be much injured by rats and mice. Set traps for these, and have a good look on the house to prevent thieving. Keep the house closed during storms, but give ventilation on dry days. The healthful condition of the foliage should be preserved in order to insure ripe wood.

Commercial Matters—Market Prices.

Gold has been in more active speculative demand, and has been as high as 150 $\frac{1}{2}$ (at the first), but it has since receded to 145 $\frac{1}{2}$, and it closes at 147 $\frac{1}{2}$. The trade in Breadstuffs has been more animated, stimulated by the less favorable crop reports, both domestic and foreign, especially the latter, and by the sharp rise in gold which helped the export movement. Prices have advanced decidedly, closing with an upward tendency for Wheat, Corn, and Rye, though in favor of buyers for Flour and Oats. Receipts have been, as a rule, on a restricted scale, though Corn has arrived quite freely. Very little of the corn that has come to hand has been fit for export. It has been more or less warm, and damaged, for the most part. Provisions have been in moderate trade and speculative receded, at somewhat better prices

for the leading articles. Cotton has been lightly sold in, closing rather heavily. Wool has been more freely offered at reduced figures, and consequently has been in livelier demand, though the market closes tamely. In the line of Seeds, trade has been more active, particularly in Clover, which has been taken freely for shipment at buoyant rates. Tobacco has been in much better request, chiefly for export, at firmer prices for the low grades. May has been moderately dealt in at easier figures. Hops have been dull and nominal.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Aug. 14, 1868, and for the corresponding month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.
RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.
27 days therefrom 106,000 577,000 2,383,000 3,500 41,000 633,000
27 days therefrom 106,000 577,000 2,383,000 3,500 41,000 633,000

SALES. Flour, Wheat, Corn, Rye, Barley, Oats.
27 days therefrom 106,000 577,000 2,383,000 3,500 41,000 633,000
27 days therefrom 106,000 577,000 2,383,000 3,500 41,000 633,000

2. Comparison with same period at this time last year.
RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.
27 days 1868. 106,000 577,000 2,383,000 3,500 41,000 633,000
27 days 1867. 106,000 577,000 2,383,000 3,500 41,000 633,000

SALES. Flour, Wheat, Corn, Rye, Barley, Oats.

abundance, but must caution our readers not to let down their anticipations of good prices, nor be deceived by the representations of speculators.

Advices from Europe indicate a great demand for American breadstuffs, already large shipments of *Hay* to England have taken place. The long continued drouth affecting Great Britain most seriously is also widely felt upon the continent. As is almost always the case we presume the governments of Europe now suppress information that would tend to raise the prices of grain, until their own wants for army and other stores are supplied. The great quantities of wheat usually drawn from Southern Russia and the Black Sea are greatly diminished, while short crops of cereals and roots, as well as hay, make a season of famine imminent unless relief comes very soon. All this will make a great demand for American products, and prices will surely rule much higher than they otherwise would. While the distressing necessities of these countries enhance the profits of our land and labor, we may have the satisfaction of knowing that as a rule the higher the prices the more even will be the distribution of staple articles of food, and the greater will be the economy exercised in their use.

SOMETHING

FOR

"The Rest of Mankind."

As about "All the World" now take this journal, it is proposed to invite the "rest of mankind," to go (or come) and do like-wise. As they have not seen—or at least have not responded to—previous invitations, it is proposed to awaken their attention and appeal to their interest, by what in effect amounts to

3 Months Subscription for \$0.00,

As here follows: to wit: viz: namely:

Every New Subscriber to the American Agriculturist for 1869, whose subscription comes to hand before Sept. 30th, will be presented with the paper the rest of this year without charge, viz.: namely: to wit:

\$1.⁰⁰ Received during September will pay for this paper, for one subscriber, from October 1868 to December 1869 inclusive, that is for 15 months (a pretty long year!)

\$5.⁰⁰ Will do the same thing for **Four** subscribers, that is only \$1.²⁵ each for 15 months.

\$12.⁰⁰ Will do the same thing for **Ten** subscribers, that is, only \$1.²⁰ each for 15 months.

\$1.⁰⁰ Will do the same thing for **each** subscriber, where twenty or more persons club together.

N.B.—The above offer is only extended to the first 999,999 New Subscribers received. The *millionth* subscriber will have to pay full price. So please tell your friends and neighbors at once, that they may not be too late, for a million subscribers is not many (for us) and Sept. 30th (the last day of the offer) will soon arrive.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

How to Remit—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us *without any loss*.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe, the Registry fee, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and send the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.*

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, *three cents*, each quarter, or *twelve cents*, yearly, must be pre-paid at the Post-office where the paper is received.

\$10,000.00 Worth of New Engravings for \$1.50, or less.—The Publishers set apart \$10,000 to \$12,000 for illustrations in each volume. The number of engravings given in the *Agriculturist* during a single year, if brought together, would cover the side wall of a room of considerable dimensions, and not a few of these are beautiful as well as instructive. Though the paper is well filled with a variety of useful information, it is safe to say that the engravings are alone worth the small subscription price. They are not excelled in workmanship by any illustrated paper in the country. We have our own engraving-room and employ our own artists—the best to be found—which accounts for the excellent style. As stated above, every subscriber gets impression from at least \$10,000 worth of new engravings, at the cost of only \$1.50 the single subscription fee for a year, and for even less when clubs are made up.

\$12,500 Worth of New Engravings for \$1.50, or less.—By reference to the above, and to the Publisher's announcement on this page, it will be seen that every new subscriber received this month will secure *five* quarters of a year for the price of one year, or at least \$12,500 worth of engravings for \$1.50, and for considerable less when clubs are made up.

A Liberal Offer is made to new subscribers this month, (see above.) One object is to begin the campaign for 1869 before the political excitement of October and November comes on. Again, every new subscriber who receives the paper for three months will be quite likely to bring many others with him at the beginning of the next volume.

The Texas Murrain.—The rapid spread and the sure and sudden fatality of this disease has justly alarmed the whole country. We have seen the danger for years and in the general apathy have not been silent, though forced by circumstances to be virtually inactive. Yet, in justice to the Publishers, we wish to chronicle the fact, that more than two years ago they offered to bear the expenses of a thorough investigation could such an one be undertaken by the gentlemen of the N. Y. College of Veterinary Surgeons. The Professors, however, have been so burdened with the labors of starting and carrying on this growing institution, that though anxious to do so have been unable to accept the offer.

Percheron Horses.—"C. R. M.," Prairie City, Nebraska. We know of no stock for sale in this country. We suppose animals suitable for breeding can be imported for about \$1,000 each, delivered in New York.

Merchant Turning Farmer.—"C. A. C.," Pittsburg, Pa., wishes to know if a merchant in the prime of life, with a strong proclivity to rural pursuits and a capital of \$5,000, above the cost of a farm, can

expect to succeed in cultivating the soil. If he has succeeded as a merchant, there is little doubt that he will do well as a farmer. The same capacities underlie success in all kinds of business. Some of the best farmers we have are men bred to other pursuits. They have brought to the farm all that intelligence, industry, skill, and enterprise, which were matured in their earlier occupations, and they very soon mastered the new situation. "C. A. C." must expect to pay something for his education as a farmer, for he will make some mistakes; but if he has a taste for fine stock and loves the smell of the soil he will succeed. He will best learn the art upon the farm, and if he is without experience we would recommend him to secure an intelligent young man bred to the farm for his foreman. Let him read the agricultural papers and exercise his own judgment in practice. For books we refer him to our catalogue on another page.

Gardening for the South.—This work, which was delayed by the death of its author, Mr. W. N. White, Esq., of Georgia, is now in the hands of the printers, and will be ready as early as practicable. It is a very full treatise on vegetable and fruit gardening, with special instructions for the Southern States.

Horticultural Exhibitions.—One after looking over our list of fairs will be struck with the meagre list of Horticultural Exhibitions. It has been the especial business of one of our assistants to note down the announcements of fairs, whether made through circulars or published in the papers. It presents us with a very full list of Agricultural fairs and a very short one of those especially Horticultural. Secretaries of Horticultural Societies are the best fellows in the world, but they are so slow. We have no doubt that the Pennsylvania, Illinois and other societies will have autumnal shows, and that we shall get a notice about three days beforehand—too late to be of use to our readers.

The N. J. State Agricultural Society hold their fall Fair Sept. 29th, 30th and Oct. 1st and 2nd. The Executive Committee all determined to make this the largest fair ever held in New Jersey. Premium lists are now ready and will be forwarded upon application to the Committee, W. M. Force, Newark, N. J., J. R. Dunn, Newark, N. J., Benj. Haines, Elizabeth, N. J. The Society's grounds are permanent, and every effort will be made to make the exhibition complete in all respects. Last fall the grounds were in an unfinished state, but this year they are ready to accommodate stock, etc.

Sundry Hamburgs.—Hallet, Moore & Co. seem to have tired of "Sandy River Petroleum Stock," and have recently assumed a new name—"The New York Jewelers Co-Operative Union." Their plan of operation is the 5 per cent assessment, as before, the only change being in name. The prizes seem to consist mostly of "800 watches," and "diamonds." The per cent on the valuation is \$10, which they are anxious to get within 12 days from the serving of the notice. Their circulars give a pretended "editorial in the Herald." What Herald? This so-called "editorial" goes on to say: "Many of our best citizens received their presents on the spot," etc. We warn all persons not to be deceived; our "best citizens" or anybody else would find it difficult to get any "prize" in less than fifteen days after calling for it, if they got it at all. Dunbar & Reed announce the "great event of the season" in a "closing out sale of Bankrupt stock," etc. Their plan is to sell tickets at 50 cents each, and if the prize draw is taken, the ticket holder is to pay them \$2 for it. Their stock embraces everything in the Jewelry line, Music Boxes of all sorts and sizes, and pistols. Of course none but the most voracious will invest money in this very evident swindle. The "Metropolitan Gift Co.," Harper, Wilson & Co., are still operating. They give a long list of quotations under "Opinions of the Press." These notices of course never appeared, and cannot be found in the papers quoted from except as a part of their advertisement, and possibly they never occurred there. Such things, however, have weight with some, even if they appear only in an advertisement in a country paper. Such is the power of printers' ink. We caution all against them; they are false in their conception and are intended only to deceive the unwary. "Harper, Wilson & Co." are not to be found at the number given. We do not suppose any body will buy C. L. Van Allen's Eureka Oil after our notice of it some months ago, as it is a both worthless and dangerous compound. Milford, N. H., is a great place. It not only produces counterfeit money but one "Mansing" with his "Mutual Joint Stock Co. and Gift Association." This is all very nice, Mr. Manager Manning, but it won't do; people are not so "green" as to suppose you will give them \$10,000 for \$90, or any thing of the sort. Evans & Co. have "retired," and Isaac

E. Rose & Co., have taken up the management of the "World at Home." The proprietors present no new features to this very evident humbug. They still offer \$300.00 shawls, cloaks, etc., to each subscriber to their paper. The parties receiving the goods are to act as agents for their paper, and increase its circulation, etc. Of course none of our readers will bite at such a poorly baited hook. The President of the "Sandy River Petroleum Stock Co." presents a new plan. For \$2.00 he proposes to "strike a duplicate" of each certificate held by any party, and post the same for sale at the Brokers Board. This "stock" is not worth one cent to any body. ... We wonder how our "generous friends" will like the new postal law. Congress in an Act "To further amend the Postal Laws," passed July 27, 1896, Sect. 13, says "And be it further enacted, That it shall not be lawful to deposit in a post-office, to be sent by mail, any letter or circular concerning lotteries, so-called gift-concerts, or other similar enterprises offering prizes of any kind on any pretext whatever." Sending any Lottery Tickets, therefore, or Gift-Enterprise circulars in the mails, hereafter is an unlawful business, and our readers will be so unfortunate as to have such letters sent them, and who know their contents to be of the character described, to return them unopened, to the Post Master, stating the fact to him, with the request that he send them at once to the dead letter office at Washington. We hope that the authorities will issue orders to Postmasters that when letters are received, the contents of which are known to be of the character of Gift Concert Enterprises to enclose them in a package to the dead letter office, and not deliver them to the parties to whom they are addressed. It is desired by the Department at Washington, that all the evidence bearing upon these swindling concerns be brought to their notice, so that justice may be dealt to those who indulge in this unlawful and wicked business.

"Two Wonders of the Age."—King Frost the fruit destroyer effectually conquered, and fruit now can be grown every year in any Northern climate, without injury from frost by premature budding. This is the heading of a circular of a chap, who in addition to that wonder has No. 2, which preserves trees, shrubs and vines. "In root, body, branch and bud from the attacks of any kind of vermin or insect," which is a very good thing to do. Of course the circular has certificates, what would a circular be without them? It is a little odd that these free doctors never get a known horticulturist to sign their circulars. The names are very good ones, and doubtless useful to those who own them, but they do not carry any weight. We learn that the proprietor of the "Two Wonders" has sold nearly \$8,000 worth of county rights in a single county in Pennsylvania. If the stuff, or thing, or process is good for anything, the rest of the world will probably hear of it. Meanwhile we advise our readers to always let very hot things cool a little before they handle them, and thus avoid burnt fingers.

Hedge Trimmer.—If any one has a machine for trimming hedges by horse power he had better advertise it, as we have a loud call for it from the West.

Deep Planting of Trees.—"C. A. E." finds the books advise to plant trees no deeper than they stand in the nursery, but "without stating the reason." The reason is that experience has shown that trees so planted usually do better than those planted deeply. While with many plants it seems to make but little difference how much of the stem is covered with earth, the bark of our fruit trees that has grown in the air is apt to become unhealthy if covered with earth.

Grapes and Pears.—"C. A. Eggert, Iowa. Why put them together? You can use your land but once, and why not let half of it be all grapes and the other all pears? If the pears are standards they will soon make too much shade, and if dwarfs they may be put as close to each other as it would do to have the vines near to them. An economical use of land may often be made by planting strawberries, raspberries, or even peaches in a young orchard of standard pears, but this is with a view to removal before the pear trees need all the land, but the vines are intended to be in a measure permanent.

Yield of Pear Trees.—A subscriber asks us to state the average yield of pear trees ten years old. It depends so much upon the variety that no definite answer can be given. We know of some trees over ten years old that have not borne a bushel in their lives.

The Naomi Raspberry.—Mr. Geo. E. Hall, Cleveland, O., sent us some specimens of the Naomi Raspberry. They came in very good order considering the distance they had travelled, and were found to be of

excellent flavor. After their long journey it was necessary to utilize them at once, or we should have complied with the request of Mr. H. to show them to our horticultural friends. The variety originated from the seed with Mrs. Gov. Ward, Rockport, O. The committee on fruits of the Cincinnati Horticultural Society in July last concluded their report as follows: "We would recommend them as the best flavored and most firm of any red raspberry that has been brought within our observation recently." The Naomi proves hardly at Cleveland.

Grafting the Grape.—J. F. Kotsch, Kansas. Grafting is practised occasionally where one has a vine of inferior quality and wishes to change it. We described the process at length a few years ago. Before the ground freezes dig it away from the stock and cut it off at six inches below the surface. The cion should have about four inches of wood and one good eye; split the stock and insert it in the usual way of cleft grafting; tie firmly, but use no wax; fill in the earth so as to leave the bud just above the surface; cover the graft with an inverted flowerpot or box, lay over some straw and cover the whole with a mound of earth. Do not uncover until freezing weather is over in spring. As not uncover until freezing weather is over in spring. As many have, of procuring wild stocks to graft for a vineyard. The plan is not advisable. No plants are so good as those grown from cuttings.

Forsyth's Composition.—"Subscriber," Allen, Iowa. We have Forsyth's old work, and are familiar with the matter you so kindly copy. Forsyth's discovery was thought a great one at the time (1874), and no doubt the treatment was serviceable. The decayed portions of a tree were carefully cut away, to leave a clean wound, which was covered with a plaster made of cow dung, lime rubbish and sand; after its application the plaster was sprinkled with bone dust. The trees recovered and credit was given to the materials of the composition, while really the removal of the decayed portion and protecting the wound from the weather did the business. The modern method of covering wounds with grafting wax, shellac varnish, etc., is much neater, more easily applied and equally effective.

Apples in Illinois.—At a recent meeting of the Alton Horticultural Society, it was the general opinion of the members that the apple crop was almost an entire failure, attributable to frosts in April.

Let Bugs Beware.—We are pleased to learn that Messrs. D. B. Walsh and C. V. Riley are to start a journal, the American Entomologist, to be published in St. Louis, by R. P. Stindley & Co. The paper is to be a monthly of 16 pages at \$1 per annum. The publishers say: "Although this publication is owned and edited exclusively by Western men, yet it is not intended to be in any wise local or sectional in its scope. Communications from all parts of the Union on the history and habits of noxious or beneficial insects are earnestly solicited, and the utmost attention will be paid by the editors to answering all questions from correspondents upon this subject, no matter whether they come from the East, the West, the North, or the South, and with never possible the best and most approved method of fighting the particular noxious insect will at the same time be briefly indicated." The enterprise is one to which we wish success.

Rat-tailed Radish.—Last month we allowed a correspondent to say that the Rat-tailed or Long-podded Radish was a failure, and corroborated his statement from our own experience. We did not know that we were lying in the face of royalty. A correspondent of the London Gardener's Chronicle says: "Mr. Carmichael (Prince of Wales' gardener) told me that he always kept a regular supply of it, and that it was much used and relished at the Royal table, a fact surely worth knowing." So important "a fact," that Wales like the Rat-tail should not be confined to one side of the Atlantic—it being "surely worth knowing," we spread it abroad. The English papers contain much snobbishness like the above, which reads strangely to an American.

Turnip Flea-Beetles.—"S. T.," Orient, L. I.—Various remedies are resorted to, to keep these pests in check. Among the safest and cheapest are slaked lime, or wood ashes, sprinkled upon the plants when the dew is on. The ashes would be quite sure to promote the growth of the bulbs, as well as destroy their enemies.

Cost of Raising Roots.—"L. G.," Shelburne, Vt.—In four statements made before Massachusetts County Agricultural Societies, the cost of Rutabagas per bushel is put at 8 cts., 9 cts., 8 cts., and 23 cts. The gentlemen who used the most manure and raised them at the rate of 750 and 900 bushels to the acre, respectively, got their turnips for 8 cts. a bushel.

The poor fellow whose turnips cost him 23 cts. a bushel raised only 336 bushels to the acre. The difference in the cost lay mainly in the manure and in the cultivation. There is a volume of wisdom in the facts here given.

Winter Radishes.—Mrs. C. K. M. The black and white winter radishes are usually sown about the middle of August, though if sown early this month they will probably make a fair crop. The Chinese Rose-colored Winter, is much superior to the varieties named, and it is not too late to sow it. Treat in all respects like turnips. Keep by burying them in a pit beneath racks of frost, or in a cool cellar in barrels, with some earth thrown among them to keep from drying up.

Use Black Ink.—It is very trying to the eyes and equally so to the patience to endeavor to make out a letter written in ink the color of which is a pale brown or dun. Good black ink costs but little.

Patented Walks and other Patents.—A friend at Troy, O., writes us a long and interesting account of a patented Asphalt walk, evidently thinking that its introduction would be a public benefit. We do not publish his communication, as our advertising columns are the place in which such things are made known. When the right to make, use, or sell a thing, rests exclusively in the hands of one person, he has, if the article be good for anything, abundant means for making it known, and journals do not feel it a part of their duty to advertise his wares.

Worms on Arbor Vites.—V. G. F. Newport, Del. The specimens are the Basket or Drop-worms (*Olfiteus confusum*), very troublesome on many trees. The method to which we have resorted, hand-picking, is the only way to get rid of them.

Do Locusts Sting?—"R. W.," Patterson, N. J. No, they do not. The common Locust or Harvest fly, (*Cicada*), and the 17-year Locust are as harmless to handle as house flies, and neither bite nor sting. During their short lives they neither eat nor drink, but simply prepare for laying and lay their eggs. The damage they do is to the trees wherein the eggs are deposited. The true Locust, (*Grillus*), we would popularly term a grasshopper, and though it eats voraciously, it can neither sting or bite to harm any one. Children frequently report themselves stung by insects which by their description might be locusts, but they probably mistake bees or hornets of some kind for them.

White Huckleberries.—C. H. B., Providence, R. I. These are sometimes found, though they are not very common. We have seen them several times in Rhode Island. It would be well for some one to experiment in the culture of this white variety.

Peach Trees.—F. Mars, Milford, Mass. The trouble described is the "curl," by some attributed to plant lice, and by others to sudden atmospheric changes. We doubt if insects have anything to do with it. Good cultivation is the only remedy. Mr. M. uses upon his trees soda containing considerable sal soda with marked effect in promoting growth. This should not be continued any later; it is not desirable to prolong the growing season, as the wood will not ripen properly.

"Tubes" in an Old Log.—A. Lear, Minnesota. The tubes made of leaves neatly rolled together contained each a grub or larva of some insect, probably a bee or wasp, but we cannot tell which one.

Dried Sweet Corn.—The canning of corn cannot be successfully done in families, but dried corn is nearly as good if properly done, and can be had by all. The excellence of this depends quite as much upon the time of picking, as upon the method of curing. If too old, no process of drying will make it tender and savory. The ears should be plucked in the milk, their best condition for eating when fresh. With a sharp knife split the rows of kernels, and cut from the cob. Spread in iron pans and place in the oven to drive off a part of the moisture. Stir well to keep from burning, and when thoroughly heated, spread upon sheets in the sun to dry. It must be thoroughly dry when put away, and must be kept in a dry place. Another method is to boil the fresh picked corn five minutes, then split the kernels and cut from the cob, and spread in the sun to dry. It is good cooked as a vegetable in winter, and still better made with Lima beans, or even common beans, into succotash. "Subscriber," Bloomfield, Iowa, boils the corn, cuts the grain one half off, and scrapes off that which remains attached to the cob. The drying is done in a shallow box, covered with a hot-bed sash, set sloping to catch the sun.

Allothus Trees.—H. C. Hermann, of Delaware Co., Pa., writes us that in pursuing experiments with the Allothus silk-worm he raised some Allothus trees. The seed was collected in September, sowed the following March, and in two years the trees averaged 9 feet in height, very straight and smooth, and made good bush poles. The labor of collecting the seed is little, for Mr. H. says a boy collected a barrel of it in an hour.

Pruning the Blackberry.—The best cultivators cut out the old canes as soon as they have yielded their crop of fruit, though it is the practice of many to defer it until spring. At whatever time it is done the operator is pretty sure to wish for the discovery of a "thornless blackberry," and if he has much work among the bushes he will soon be scratched into looking about for some implement that will enable him to work with more comfort. Pruning shears with long handles, which are used for the purpose, are sold by the implement dealers, or a hooked knife like the one in the engraving may be fixed to a handle and will answer quite as well. The knife should be made of good steel, and it will be found useful not only for cutting the canes, but for pulling them out of the way when severed. At the time of pruning, pinch in the side branches upon the new canes.

Plants Named.—J. W. Russell, Tolland Co., Ct. The Hop Clover, *Trifolium repens*, an annual yellow-flowered clover introduced from Europe, and not rare as a weed.... Mrs. R. T. H. P. Henry Co., Ill. The Lead-plant, *Amorpha canescens*, which has long been supposed to indicate the presence of lead ore.... R. S. S., Sangreets, N. Y. No. 2. Mouse-eared Chickweed, *Cerastium vulgatum*, No. 1, not found.... Miss C. A. B., Syngden, Mass. See answer to P. L. C. last month.... W. H., Genoa, O. Squirrel-tail Grass, *Hordeum jubatum*, which we never before heard charged with being troublesome; good cultivation will eradicate it.... S. L. L., Chatham, Iowa. *Tephrosia virginica*, called both Goats' Rue and Catgut.... J. G. W., Hatfield, Mass. From the description we guess your tree to be the Hackberry, *Celtis occidentalis*; the specimens did not reach us. Try again.... Mrs. M. D. D., Rock Island, Illinois. The Wild Balsam Apple, *Echinocystis lobata*. Sometimes cultivated to cover trellises. W. L., Orange, Edwards Co., Ill. *Kohlrut-river pandanata*, a beautiful ornamental tree, which is but little known.... J. B., Lima Co., O. *Waltheria grandiflora*, a handsome blue-flowered hardy annual from California, quite common in gardens.... M. R. A., Elliot, Me. No. 1, Choke-cherry, *Pyrus eschscholtzii*, No. 2, Slender Gerardia, *G. tenuifolia*, No. 3, Canada Hawk-weed, *Hieracium Canadense*.

The Farmers' Club on Botany.—At a meeting of the Club in July, one member hoped that botany would be taught in common schools; whereupon there was an outflow of wisdom. One speaker said: "I believe that botany will have to be entirely rewritten before it can be used in schools. We don't want so much science, but a more practical system than the one now in use." Another added: "I have looked in Wood's and Mrs. Lincoln's botany, but could not find how trees grow. There were plenty of descriptions of small, insignificant, and worthless weeds, but very little about our most useful plants. This is not as it should be; for the most valuable plant should receive the greatest attention." Of course all the botanists from Linnaeus to Gray knew nothing. We hope that the Club will get up a system of botany to suit their needs, without "so much science" in it. The multiplication table is taught to some, but it pays to learn it, and if it could only be shown that botany would "pay," those who talk about it as those Club people do, would very soon find it "just as easy."

Double Peaches.—J. E. E., Gettysburg, O., writes that a variety of peach known as Yellow Freestone produced very few single peaches, but the fruit was almost all "from two to six double." Nearly all the double fruit has fallen. Mr. E. wishes to know the cause of this phenomenon—which of course we are unable to answer. There is one point that would be interesting to know: do these double peaches come from a mal-formed blossom, or are they apparently double from the crowding together and cohering of the fruit when young. It would be well to observe the trees next spring, and if the blossoms appear of unusual shape we would like specimens.

Whitlock's Horticultural Recorder.—The second volume of Whitlock's Advertiser appears enlarged, improved, and with the above title. Mr. A. S. Fuller is the editor, and the Magazine in the variety and value of its contents takes rank among the best

publications of the day. The magazines which have so long occupied the ground must keep an eye on this new comer or he may yet "go to the head of his class."

A Grape Vine Beetle.—"A. D. B.," Princeton, N. J. The beetle that has destroyed the leaves on your Delawares and Dianas is apparently *Anomala lucida*, the Light-loving Anomala. It is related to the May Beetle, but is much smaller. Shaking the beetles from the vines, catching on sheets and destroying, is most likely the only reliable means of stopping their work.

The Work of Locusts.—A. H. Martin, Charlotte, N. C., and A. L. Griffith, Jasper, Tenn., send us twigs showing the excavations made by the 17-year locusts in depositing their eggs. The habits of the insect are described in the *Agriculturist* for October, 1894.

Lima Beans.—These beans make slow progress in the country for an article admitted to be the best of its family. They are an excellent vegetable whether cooked in the green or dry state, and are perhaps the best substitute we have for the potato. If dry, they should be soaked over night. Boil two hours or until soft. After boiling they are admirable fried in butter.

Fruit-Gatherer's Ladder.—We find in the London Journal of Horticulture a plan for converting a common ladder into a self-supporting one, which for low trees will answer better than our method of sustaining by guy ropes. The article is contributed by an "Amateur" who used a ladder 12 feet long. Two stays or props of equal length of the ladder are made of 1½ inch split, 2½ inches wide at the foot, tapering above and pointed below. At the upper end of these props slots (B) are cut, and were we to make them we should strengthen them by an iron band or a rivet, to prevent splitting. Upon each side of the ladder near the top is inserted a

T-shaped pin, which screws into a nut which is sunk into the side pieces, as seen at A. These pins can be removed when the ladder is used for other purposes. When used for fruit picking it is put together as shown in the figure. The ladder is placed where needed and the props put in position to hold it there by simply slipping the slots under the pins, as in the figure. The props being independent of each other can be introduced between the branches if necessary. We might have copied this ladder without giving credit. If we followed the example of the Journal of Horticulture, which in its issue of July 30th takes an article and figure of a Handy and Powerful Lever from the *Agriculturist* without the least intimation that they are not original. But that is not our way.

Fine Gladioluses.—Mr. Geo. Such, of South Ambry, N. J., has the gladiolus as one of his specialties. He exhibited some at our office, which for size of spike and beauty of flower we have not seen equaled.

The Thursday Shows and Meetings.—Mr. Whitlock has done a good thing in offering facilities for weekly exhibitions and club meetings. Similar gatherings were held at H. Park Row until the space could no longer be spared. We invite those who used to find those meetings pleasant to aid the present ones by their attendance. The central location—in the *Agriculturist* Building 245 Broadway—makes it very convenient for business men, as well as for those who are visiting the city. Understand that the whole thing is free, there being no charge of any kind. There is like-

wise no competition for prizes. Fruits and flowers are shown, compared and talked about, and any one interested in these subjects can hardly fail to get some information or impart some. We hope our friends who visit the city will call in on Thursdays at noon, bring some specimens if possible, and at any rate give their presence.

Cultivated and Uncultivated Strawberries.—R. M. C., Mooton, Del., writes that while well cultivated strawberries produced a poor crop, the same variety (Wilson) without any cultivation ripened earlier. "The uncultivated beds had a heavy growth of grass and weeds, which were killed by the fall frosts, and served as a winter protection, followed in the spring by white clover and weeds, which were in vigorous growth at the time of the ripening of the fruit. Was the increased yield caused by the winter protection thus afforded, and was the early ripening of the fruit caused by the same, or was it caused by the green growth during the ripening season?" We should attribute the better condition of the weeds beds to the protection afforded by the dead grass, and cannot see how the growth of weeds this Spring could help the early ripening.

An Odd Raspberry.—G. Underwood, Pittston, (no State,) writes that he found a raspberry with a double fruit, and transferred it to his garden, where it maintains this character. The stem is flat and spreads out at the top in a fan shape. From the description, we judge this to be a case of "fasciation," which is not rare in plants. Parts that are usually distinct become joined together. It often occurs with sunflower, Japan lilies, &c. Whether this variety of raspberry will prove valuable as well as curious, experience will determine. We hope to hear more of it.

The Tomato Question again opens upon us, and we shall try to give all sides a fair hearing. In discussing the earliness and productiveness of the Tomato we must bear in mind that soil, situation and climate have their effects, and that a report from the light and sandy soils of Long Island and New Jersey will not be likely to agree with one from the rich prairie gardens. Mr. Jas. Perkins, Newmarket, N. J., sends us specimens (Aug. 18th) of Cedar Hill and New York Red. Seeds sown April 18th, plants set out May 25th. Fruit ripe in 122 days from sowing—too long a time by 10 or 15 days on account of spring rains. Mr. P. thinks the Cedar Hill of good flavor and density and valuable as an early variety, and the N. Y. Red the greatest cropper.... Louis Ritz, Plainville, Ohio, sends an account of a carefully made experiment with Keyes, Cedar Hill, Early York, Large Smooth Bush, and Tilden. The seeds were sown at the same time and the plants treated in all respects alike, with the following results: "The Keyes is, no doubt, the earliest of all, and yields largely; but only the first tomatoes are of a fair size, the succeeding ones growing smaller and smaller. I think it would pay to plant the Keyes, for early use, close together, say one or one and a half feet apart, and pick all the blossoms except the two or three first clusters, and it would, no doubt, yield a paying crop. The Early York is early, but a poor yielder. The Extra Early is not as early by a few days, but more profitable, yielding largely; not quite as solid as the Keyes, but of fair size and good flavor. The Cedar Hill is a good bearer, fair sized, rather smooth, but tender, and on that account less profitable for market. It is, however, the best early tomato for family use. The Large Smooth Red and Tilden are later than the other varieties, but furnish finer and larger fruit, and for marketing are more profitable."

Harvesting Beans.—J. G. Bailey, Rockingham Co., N. H., writes that he has a method of harvesting beans that he prefers to those we have recently published. We have practised the way he describes in harvesting a small lot, and were much pleased with it. "Stakes 2 inches in diameter, 7 or 8 feet long, and pointed at one end, are set firmly in the ground about 8 inches apart. The stakes are set about a rod from the end of the row, being made for them by pulling a few bills. Bind a with around the stakes a foot above the ground. Pull the beans, holding them by the roots, and when the hands are full take them to the stakes, lay them between the stakes, putting in the roots of each handful in an opposite direction from those of the preceding one, letting them lay sufficiently to hold them. When the stakes are filled to the height of 5 or 6 feet, put on another with, and continue to fill as high as you can reach. The stakes should spread apart gradually, leaving the stack flaring at the top. When the beans are cured two men can pull up a stack and place it on a wagon. In thrashing lay the sticks on the floor, thrash one side, then turn them over and thrash the other. Beans properly stacked may be left out for a long time. The stakes, if of durable timber, may be hauled and answer for several years."

Wheat Weevil and Clover.—A gentleman in Pulaski Co., Ind., sent us a communication in which he asserts that red clover is the nursery of the "wheat weevil," also called midge, and advises farmers to abstain from sowing clover if they would save their wheat. Having occasion to send to the eminent entomologist, B. D. Walsh, Esq., we enclosed our correspondent's letter, to which Mr. W. replies as follows: "Your correspondent suggests that clover is the nursery of the Wheat Midge, *alias* the Red Weevil, *alias* the Weevil; and hence infers that farmers must quit growing clover, if they wish to be free from this pest. He is altogether mistaken. The Wheat Midge can exist only in certain species of the grass family (*Gramineæ*), and certainly cannot breed in clover, which belongs to an entirely distinct botanical family (*Leguminosæ*) the Pulse family. If such men as your correspondent would like to school themselves for a few months before settling up as school-masters in entomological matters, the world would be spared a great deal of ignorant balderdash. There is a very small snout-beetle (*Aphidæ*), the larva of which breeds in the heads of red clover. The gentleman perhaps happened upon this larva, and jumped to the conclusion that it must be that of the wheat midge, though the two are as unlike each other as a Rose and a Peony."

Potato Bugs.—**Unsafe Advice.**—The following is going the rounds of the press. "Sure death to Potato Bugs: Take 1 lb. Paris green, 2 lbs. pulverized lime. Mix together, and sprinkle the vines." We consider this unsafe, as there is no intimation of the fact, not generally known, that Paris green is a compound of arsenic and copper, and a deadly poison. Such things should never be recommended without a full statement of their properties, so that one may know with what he is dealing. The poison would be very likely to kill the potato bugs, but how about the vines?

Time for Wheat.—We wish the readers of the *American Agriculturist* would try the effect of lime on the wheat crop. A few square rods would be enough for the experiment. Put a bushel of fresh slaked lime to a square rod and note the effect. There has been very general complaint the past harvest of shrunken wheat. It is attributed to the hot weather in July; but the fact that in many instances where the land was in good condition the wheat was plump and fine proves that it is not wholly due to the climate, or at least that the difficulty may be overcome. It is well known that liming the soil has a beneficial effect, especially in stiffening the straw and producing a full, plump berry. We believe the time has come when much of our wheat land, even to the limestone regions, would be greatly benefited by liming.

Plaster, How Prepared for Land.—**"T. W. E."** Salt Lake City. The only preparation which Gypsum rock needs for sowing is pulverizing. It is ground in mills made for the purpose, and is burned only when used for making casts, hard finish, etc. Your better course would probably be to purchase the machinery and put up a mill. It acts most beneficially upon land remote from the sea. Sown at the rate of one or two bushels per acre, it greatly increases the yield of grass and in some of the grazing districts it is considered the cheapest and best fertilizer that can be used.

Bone Mill.—"E. H. C." who wrote us some time since inquiring for a cheap bone mill, is informed that the article has not been invented. The bones are strong and require great power to crush them. It would take ten or twelve horse power to grind bones, and a suitable mill would cost several hundred dollars. Persons having good bone-mills to sell should advertise.

Now is the Time to Destroy Red-Root.—On many wheat farms Red-root, or Pigeon Weed (*Lithospermum arvense*) is a great pest. The seed germinates in September and October, and the plants come into flower early in the following summer. They are easily destroyed, but the difficulty lies in getting at them. They are seldom found except in Winter wheat, and the only way to kill them is by hoeing the wheat or pulling out the red-root by hand. Old farmers say the only way to kill them is to make the red-root think that you are going to sow the land to wheat in the fall, and then not to do it. The red-root will start up, and by plowing the land in the spring the plants are all destroyed. Cultivating among corn does not free the land from red-root, because it cannot be done late in August or September. Barley is sown after the corn and the land plowed after harvest and sown to winter wheat. The red-root then springs up and seriously injures the crop. Now, if the land for corn could be broken up in August or September, the red-root would start, and would be killed by the plowing next spring. Or, a two or three year old

clover sod might be broken up in August or September, and then sown to barley the next spring, followed with winter wheat. The difficulty is that at this season the land is often so hard that it is difficult to break it up. But even if the land is plowed very imperfectly and not more than two or three inches deep, it will effect the object. The hot sun will kill the roots of grass and weeds, and when rain comes the red-root will start. As the land has not been plowed since it was in wheat the seeds of red-root are near the surface, and shallow plowing would be better than deep plowing. But later in the fall, plow the land again deep and well, and let it lay rough for the winter. Land so treated will be likely to give a splendid crop of barley and a good wheat crop afterwards, and we get rid of the troublesome red-root into the bargain.

Ice House.—**W. A. Burton**, Iowa, wants hints on building an ice and milk-house together. He will find a very good plan of an ice-house in the October *Agriculturist*, 1866, with six illustrations, and several valuable hints in November 1867. These conveniences, a milk and ice-house, can very well be put at the end of the L, where a house has this appendage. The milk room might open into the L, and it would save some labor to have a small door or opening from the ice-house directly into the milk room. But the large door for filling should be upon the outside. If the drainage and packing are good, the material of which the house is made is of secondary importance. The room for holding the ice for a family should be about 12 feet square and 12 feet between joists. This will give plenty of ice for the whole season, and the extra expense of filling, where the ice pond is convenient, will be small. We are glad to know that the luxury of ice in summer is more generally appreciated by farmers.

Mechanic Turning Farmer.—"D. D. H.", Richmond, Ind., wishes to know if a young mechanic who takes a lively interest in agriculture, and especially in horticultural pursuits, would do well to go to Iowa and follow farming. If he had a capital of a thousand dollars to begin with he would probably succeed. Why not buy a few acres in the vicinity of some one of the thriving cities of that State, and start fruit and vegetable gardening? Perhaps Richmond might be just the place for this business. It pays well, and can be indefinitely extended.

Canada Thistles—How to Kill.—"W. H. H.", New Milford, Conn., says, cutting them with the hoe even with the ground every two weeks during the period of growth will surely kill them. I have repeatedly destroyed patches of thistles in this way, and in only one instance have I seen a thistle the second season." This is a laborious process; but to leave the thistles to multiply will make still more labor.

Notes from Colorado.—A well known botanist, now on a scientific expedition, writes us from Denver as follows: "On several of these streams, especially the Big Thompson, St. Vrain and Boulder Creek there is a considerable amount of cultivation in the valleys, by means of ditches, which lead off the water from the main stream into the fields. We saw many very fine fields of grain. One man told me he had 30 acres of oats which would yield 75 bushels per acre. But it is yet a mystery to me, how the many millions of acres contained in these arid plains are to be made productive of human food except in the way of raising cattle, etc. I have looked with considerable interest and care to see what kinds of grasses cover the plains. Several species of *Triticum* are found. *Triticum repens* seems to be the principal grass. This grass, the Couch or Quack, which gives farmers so much trouble at the East from its difficulty of being eradicated, seems to be Heaven's boon to the Plains. However, as we approach Denver from Cheyenne, the Buffalo grass (*Buchloe dactyloides*) and *Monroa squarrosa* become quite abundant, and in the valleys are large patches of a grass looking at a distance like our Red top, but what it is I have not yet satisfied myself."

The Second Annual Report of the Secretary of the Connecticut Board of Agriculture.—This volume is made up principally of the reports of the discussions and the lectures of Professors Verrill and Brewer at the meeting of the Board held at Hartford, last January. The discussions on breeds of cattle, dairy husbandry, and feeding cattle, brought out a great variety of useful information from the principal breeders and dairymen of the State. The full reports of the lectures, with illustrations, is a valuable feature of the work. We trust the Board have taken measures to secure a wide circulation of their report among the people of the State, for the audiences that heard these very instructive lectures were exceedingly small. Judging from the attendance both at New Haven and at Hartford,

the city is not the best place to hold these meetings. Almost any rural village would have given hundreds of hearers, where the city afforded tens. The volume is from the press of Case, Lockwood & Brainard, Hartford.

Reclaiming a Swamp.—"G. L.", Bridgewater, Vt., wishes to know how to proceed in reclaiming a swamp, the soil of which is black muck to the depth of a foot, and the subsoil hard sand and clay. The first step is to find an outlet, and provide for the escape of the water. Get four feet if you can, but attempt draining if you can have only two. Cut off all water from the adjacent upland by a drain near the edge, to the full depth of the fall at the outlet. Then put a main drain through the middle, and cross drains about two rods apart emptying into the main and side drains. Tile are the cheapest in the end, because they save so much labor in the digging of the ditches, but it is better to use stone or wood than not to drain at all. The sand might be spread upon the surface as a top-dressing, after the drains are completed. It is not necessary to do the whole job in one season. Begin at the outlet and make thorough work as far as you go. We recommend to all persons undertaking draining, Waring's work on "Draining for Profit," published by Orange Judd & Co. Price, post-paid, \$1.50.

Wild Mustard or Kale—How to Kill.—"W. P. S.", Flackville, N. Y. The best way to eradicate this and all weeds is by persistent cultivation. If the ground is very foul, we would recommend a summer fallow, plowing and harrowing the ground alternately, as often as every fortnight. Every time the surface of the soil is disturbed a new crop of seed is brought into those conditions in which it will vegetate, and the subsequent harrowing or plowing destroys them. In a fallow ten or a dozen crops may be destroyed in a season, and it is very much cheaper to destroy them with two horses on a grand scale than with two fingers among cultivated crops. Make a business of weed killing.

Cream Skimmer for Deep Vessels.—"The question has often been mooted whether or not much cream would be lost if milk were set for cream to rise, in deep vessels. Experiments have given very diverse results, and what the reason was, nobody knew. Thorough cooling of milk as soon as it comes from the cow, not by immersing the cans in cold water or putting ice in the milk, but by passing through a cooler, is found to check all tendency to sour for a long time. On milk thus treated cream will rise through the depth of a foot, or more, as easily as through milk three inches deep, set warm from the cow in ordinary pans. The coolers are patented, but the cream is removed by a simple dipper, which we figure. It bears the name of the Orange Co. Cream Dipper, and is made of a half circle of tin, bent around the centre of the circle, and the straight edges lapped and soldered, with a wire for a handle. This is dipped into the milk after wetting in water; the cream parts around it, and flows into it when the edge sinks low enough. Thus, all is easily removed. The dipper is useful for taking grease from a pot of hot soup, and for any other purpose when a light liquid is to be removed from a denser one. The method of milk cooling above alluded to recommends itself to all who sell milk, or set it for butter."

Fresh Fish Compost—How to Prepare It.—"A. D. M.", Hyannis, Mass., complains that turnips will not grow in a compost made of fresh fish and sandy loam. He says: "The seeds germinate, but do not grow. A neighbor tells me it is the oil that makes the trouble, and says if the fish had laid in the heap one year they would have done better." Our diagnosis of the case would be a little different from the neighbor's. The oil is of little benefit to vegetation, and for this reason fish scrap, after the oil is pressed out, is worth about as much for manure as the whole fish. If there is not an oil factory at Hyannis, there ought to be immediately, and the oil be saved. The compost was made with sandy loam, and there was not enough of carbon in it to absorb all the ammonia or to divide the fish. The manure was too powerful, and burnt up the roots of the turnips, as fast as they formed. Peat and muck are much better absorbents and dividers for fresh fish, and even of these at least five tons should be used to one of fish, and the compost should be forked over twice, in a thorough manner, before it is used. The compost unquestionably improves by age until the fish are entirely decomposed. Lime and ashes are not wanted in the heap, but are better applied to the land. See Volume, XV, 1856, pp. 248 and 272.

Dairying at the South.—"J." East

Tennessee. Dairying can be carried on to great advantage in all the mountainous districts. A cheese factory has been established at Asheville in North Carolina and is doing well. About 8,000 pounds of cheese were made in May and June, and the cheese sells at 30 cts. per pound in the home market. The managers of the dairy came from the North, and there are plenty more ready to go.

Fish Guano—Value of It.—"E. B. G."

Pa. The statement that "one ton of fish guano mixed with a hundred loads of soda is worth as much as a hundred loads of stable manure" is rather strong. It contains from three to ten per cent of ammonia, and sells from twenty to fifty dollars a ton, according to its fineness and dryness. It is the cheapest form of ammonia we know of.

Wheat in the Sea-board States.—

H. Poor, who has been preaching wheat and raising it these twenty years, writes us: "It is a well ascertained fact that spring and winter wheat can be raised abundantly in all the New England States. Farmers need no longer doubt the capacity of their soil to give them their bread. If short of manure, bono dust and other fertilizers are plenty and cheap. Four bushels of wheat are equal to a barrel of flour." The secret of success is manure applied to well drained soils. Drill in the wheat and cultivate it. We believe statistics show an increase of wheat raising in the older States.

Steaming Hay for Cattle.—"J. H. C.," Augusta, Ill.

Nothing but steam is wanted to cook hay, or any other kind of food. Steam under pressure is much hotter than water, and, of course, will cook more rapidly. The difficulty may be in not having your box, or steaming vat, tight enough. There is no particular danger of steaming hay too much. The softer it is made, the more easily it is digested.

Bone Phosphate and Superphosphate.—"J. K. P.," Cold Spring, asks, 1st. If Professor Johnson's formula for making superphosphate given in the *June Agriculturist* would apply to a large quantity?

2nd. The price of phosphate and fish guano? 3d. If the Charleston deposit could be used for making superphosphate? 4. The formula mentioned is good for any quantity. It could be made somewhat cheaper at the factory on a large scale, because the materials could be purchased at the wholesale price and the factory would have conveniences for handling that farmers generally do not have. 2. Baker's Island guano is not in market. Fish as scrap \$25, and fine ground and dried \$45. 3. The Charleston deposit is a good bone phosphate according to the analyses given, and a company is formed to manufacture fertilizers from it.

What Variety of Wheat to Sow.

This depends on the character and condition of the soil. Short-horn cattle, that have been bred for the purpose of taking on flesh rapidly, require rich food and plenty of it, and no sensible farmer thinks of keeping them on a poor, scant pasture. He selects a breed adapted to his land. It is so with varieties of wheat. Some require more and richer food than others. Take a variety that, with a sufficient quantity of appropriate food, will produce forty bushels of choice wheat per acre, and sow it on poor land, where it cannot get food enough to form twenty bushels, and what will be the result? Let the shrunken grain of the past harvest answer.

We know two farmers in one of the best wheat-growing counties of Western New York, who have just harvested and sold their wheat. One had thirteen bushels of wheat per acre, that weighed 54 lbs. per bushel; the other had 37 bushels, that weighed 62½ lbs. per bushel. The former was glad to get \$1.80 per bushel for his crop, and the other sold his at the same time for \$2.60 per bushel. One crop brought \$21.16 per acre, the other brought \$100.90 per acre. In the same neighborhood there are two farmers that last fall had two litters of pigs from good common sows, crossed with a thoroughbred Essex boar. The one farmer fed the sows liberally, and the little pigs had the run of a barnyard during the winter, where cattle were fed on grain and clover hay. The pigs soon learned to eat the heads of clover, and on this and the grain they picked up, thrived astonishingly. During the summer they had the run of a good clover lot, with the waste of the house and sour milk, and to-day would sell to the butcher for \$30 a head. The other litter belonged to a man who thinks that "a sow to breed well must be kept thin," and who winters his cattle on straw, and lets his pigs have the run of the barn-yard in winter, and of the road-side in summer. This litter of pigs to-day, though the same age and

of the same breed as the others, would be dear at \$8 a head. Naturally enough, he says that "Essex hogs are a blunder." And he is right, for his style of feeding common hogs would be better. They will not grow as fast on rich food, nor suffer as much from a scanty supply. It is just so with varieties or breeds of wheat. We must select those adapted to the conditions in which they are to be grown. If you have a very choice piece of land, capable of producing 35 bushels of white wheat per acre, it would be unwise to sow it with Mediterranean wheat. On the other hand, if you have a poor run down, neglected, half-tilled weedy piece, that in all probability will not produce more than 15 bushels of Mediterranean, it would be unwise to sow it with Diehl or Soules. It would be like turning a flock of Cotswold sheep into a hilly pasture, where Merinos could hardly get a scanty subsistence.

The farmer who got one hundred dollars an acre for his wheat has no better land naturally than the one who got less than twenty two dollars an acre. The climate is the same, and there is no other difference except in the management. One cultivates thoroughly and manures highly. He employs a good deal of hired labor. Does not work much himself, but sees that those he hires earn their money. He has taken the prize for the best farm in the State, and is one of the most thorough, energetic and prosperous farmers in the country. His land is clean and rich, and no matter what the season is, he has almost invariably excellent crops. We have heard him say that he believed he could make a good crop of corn if not a drop of rain fell from the time it was planted till it was harvested. He would depend on frequent cultivation, keeping the ground mellow and not suffering a weed to grow. His land is as rich as it was when first cleared, and he can raise just as good wheat. It is not owing to the variety, for the kind he raises is the good, old-fashioned Soules, that so often fails of late with ordinary treatment.

In view of the state of our finances, the general stagnation of trade, manufactures and commerce, combined with high prices for nearly all the necessities of life, we could almost wish that we had, for a year or two, a choice variety of wheat that would give large returns for poor treatment. But there is no such variety, and it is vain to search for it. The only way to raise good wheat is by good culture. Make the land right and then get the best variety to be found. If the land is poor and you have not time to enrich it, be content with sowing an inferior variety. It will do better than the choicer kinds, which need richer food and better treatment. And in the meantime, make calculations for the harvest of 1870. Select a small piece of the best land you have, and if it is not clean break it up this fall and plow it again early next spring and again after the corn is planted; cultivate, harrow and roll till every weed is destroyed. Then plow again in July and again just before sowing. Drill in two bushels of the choicest variety of white wheat you can find, and you may reasonably expect a good crop, and the land will not forget such treatment for years. If sowed with clover, it will give a grand crop of hay, and if this is cut early a crop of clover seed may be expected that will alone pay for all the labor of the summer fallow. Will some of our readers figure up the difference in the profits of a crop of wheat that brings \$100 per acre and one that brings only \$21 per acre?

Texas Murrain or the Spanish Fever.

We are a selfish and improvident people. We have received warning after warning. We have known of this terrible murrain by which the Texas herdsmen has seen his cattle swept away by the hundred in a night. We have known how it has dealt destruction to the cattle of Missouri and Kansas, whose grazing grounds were annually traversed by herds from Texas. We have even seen the disease on the hither side of the Mississippi, when it followed the trail of Texas cattle into Kentucky in 1866. Yet the General Government took no steps to have it investigated, no State Government has looked to the matter. Missouri and Kansas passed laws prohibiting driving of diseased cattle through those States; but these Texas steers are not to appearance diseased, and so far as we know the only sanitary measures so far attempted, have been those of the springing of the farmers along the lines of travel, and the putting a sudden end to the traffic by prohibitions enforced by powder and ball. In the *Agricultural Annual* for 1867, Dr. John H. Tice, of St. Louis, described the disease particularly, and though the article be brief, it is more to the point than many of the labored dissertations which have crowded the press since the appearance of the murrain in Illinois and along the great railway lines from Cairo, Ill., to Providence, R. I., and which caused so great excitement and alarm last month. This visitation is so sudden and locally destructive that the people are aroused to the importance of investigating and knowing something about

this alarming and fatal disease besides its results.

The facts are briefly as follows: Texas cattle have been during the summer brought up the Mississippi in great numbers and landed at St. Louis, Mo., Cairo, Ill., New Albany, Ind., and at other convenient railroad termini, they have been densely crowded on the steamers, not fed nor watered regularly, and when landed turned out to graze and recuperate before being shipped by rail, or driven into the interior or to market. The cattle, chiefly cows, which followed the Texan cattle upon the grazing grounds, or which picked up the hay and corn left by them in the yards, after they were driven off, shortly exhibited in great numbers symptoms of disease, and soon after died. Those familiar with the Spanish fever pronounced it to be unmistakably that malady.

The Texas beesves appeared tolerably well. Cattle simply coming in contact with them have not usually taken the disease, and according to the facts now known, it is rarely communicated in that way. Northern animals crossing their trail or on their pastures, take the disease and die with it, while the Texans which communicated it continue a long time apparently well. In Northern stock the incubation of the disease,—that is the time it hides itself after the exposure to infection before it breaks out—is variable, varying from a few days to several weeks; while if not slaughtered before, the Texans may not be struck down by it for months. The disease is communicated only by Texan cattle to Northern ones so far as reported, not by home cattle to home cattle. If communicated, it is possibly in that torpid, chronic form which the Texan cattle have, and which is so long in developing. The disease appears to be uniformly taken by cattle grazing on the same ground or standing in the same yards where Texas cattle have been. The diseased Texas herds are probably those which have arrived since the very hot weather. Those received early in the season have neither communicated nor developed disease, so far as we have seen the reports.

We greatly rejoice in the general alarm, because so many people are brought to agree with us that "this thing has gone far enough," and because we hope that something will now be done to shield all our citizens effectually from the disease. We must say we feel no very great concern as yet for the safety of the herds of the country. Texas cattle are well known by their peculiar build, wide coarse horns, etc. Droves of them will not be moved at present except perhaps by rail to the market. Diseased Northern herds will shortly run their course,—very few live, and those are said to lose their hair in patches, or all over their bodies. If cattle take the disease only as stated, the fact will soon be known and guarded against; the most important fact of all is, *the first severe frost puts an end to the infection.*

Symptoms.—An animal acutely attacked draws itself up, bowing its back; its head falls; its ears droop; its eyes are dull; the coat is staring. It refuses food, passes blood or is constipated, and the urine is very dark. It shivers as if cold. Its respiration is labored, and it often runs at the eyes and nose. Cattle suffering with the Spanish fever have usually great thirst. Dr. Tice says: "In all the cases that came under my own cognizance, the patients suffered from thirst, but drinking, especially cold water, was fatal almost immediately. I have seen affected cattle get up and slake their thirst at a brook, return to the bank and drop down dead." Alluding to the statement of some observers that the cattle neither exhibited thirst nor hunger, he adds: "It is said the banks of rivers and streams (in Texas) are often lined with the carcasses of cattle dying after drinking." The first symptom is an increase of internal temperature, it rising from 95° to 103°, or to 106°. The animals have a high fever, the milk of cows dries up, and the disease runs its course within three or four days usually. The localities most seriously affected by the disease have been along the railroad lines, where the Texas cattle have been taken for pasturage, and the eastern cattle yards, where the cattle have been sent for slaughter. Boards of Health and other officers have taken prompt and judicious measures to prevent the spread of the disease and the use of the meat.

What should be done? The question affects every one! The Chicago Packers' Association took the first right step, (seconded as we hear by Gen. Capron, Commissioner of Agriculture) in employing Prof. Gamgee, who was at the time at Chicago, to go with medical and other gentlemen to thoroughly investigate the disease and its causes. The report of this Committee has not been made public up to the time of our going to press, though sundry conflicting statements, purporting to come from Prof. G., are reported by the newspapers. Judging from the light we have we should certainly say an absolute prohibition of the traffic in Texan and Cherokee beesves should be enforced except during the season of occasional severe frosts. The dates might be set as between November 1st and March 15th, or the date of the commencement of the driving or shipping of the cattle might be announced by the Governor of Missouri, the Commissioner of Agriculture of the United States, or some other suitable person.

Asiatic Fowls—Cochins.

We obtain from Asia, and especially from Eastern and Southern Asia, a number of striking and useful varieties of fowls. Among these are the Malays, Brahmas, and Cochins, all notable for their great size. The first named have been long known, but are now quite rare in this country, no doubt on account of the superiority of the other breeds. They are a gaunt, leggy fowl, of a somewhat game-cock look, but coarse; not so courageous in battle, but vindictive and cruel towards a weaker foe. The Brahmas or Brahina Pootras and Cochins resemble each other in general characteristics very closely, yet in some respects their habits are so different that it can hardly be doubted that they are regarded as distinct breeds from no mere fancy of the poultry breeders, but from inherent differences which careful breeding should preserve. We have from time to time received from China fowls very similar to these, which have borne several names now pretty much dropped from the roll. We hear no more of Shanghaes, little of Chittagongs; yet these were favorite breeds but a few years ago. The reason of this is that at the ports whence we received our China fowls, there was very little care taken to keep the breeds separate, and communication with the interior was difficult; hence Shanghaes with feathered legs and with clean ones, white, buff, gray, and brown, and marked by other differences, found their way to the breeding yards of England and America. After sufficient time had elapsed for the careful study of the breeds, their habits, and uses, they have been, by common consent, classified as Cochins and Brahmas, while the clean legged varieties of these breeds have been dropped as probably mongrels and unworthy of cultivation.

The Cochins are of various colors, while in form and plumage otherwise they are very similar. We give engravings taken from excellent photographs of three buff Cochins fowls from the yard of a young amateur, Mr. G. H. Leavitt, of Flushing, L. I. These birds are remarkable for their size, and though their form may be somewhat criticised by those who know the breed only in their own yards, or through Mr. Harrison Weir's beautiful and natural portraits of famous birds, belonging to noted English breeders, (in which we must believe he allowed his facile pencil to represent the birds a little nearer to what he wished to see them than they actually were), yet, considering their weight, it is remarkably fine.

The cock, photographed at 9 months old, weighed at a year old, 14 pounds; the hen on the left is an old fowl, and weighs 12½ pounds, and the other is, or was when photographed, 9 months old, and when a year old weighed 11

Fig. 1.—BUFF COCHIN COCK.—FROM A PHOTOGRAPH.

pounds. We find among the sub-breeds of Cochins, those of a nearly pure white color, all shades of cream, buff, lemon, partridge colored, brown, and even black, or very nearly black. The external characteristics of the Cochins are large-sized bodies, profusely feathered with soft,

legs, feathered to the end of the middle and outer toes; full neck hackle, and saddle hackle, and very small tails, which are nearly concealed in the fluff and hackle feathers. The hens have delicate combs, mild eyes, smaller legs, shorter thighs than the cocks, and characteristic plumage. The color is various, the tail being generally dark, and sometimes black in the buff, lemon, cinnamon, and partridge varieties. The Cochins are a very domestic breed, seldom wandering far from their yard, even if free range be allowed them. They differ in this respect from the Brahmas, which wander far, are early risers, and late in going to roost, while the Cochins are constitutionally lazy birds. They are hardy, mature early, are excellent winter layers, and crossed with Dorkings, Crevecoeurs, or games, make most delicious and early chickens. Broilers sell well in green pea time, but the fowls are not superior for the table, as their flesh is not so delicate as our common dunghills, or as the various crosses with the Cochins named above.

Arrange to Sow More Clover.

The value of red clover as a renovator of the soil is not generally appreciated. It makes excellent hay, and when consumed makes a manure very rich in nitrogen. A ton of good clover hay contains about 50 lbs. of nitrogen, probably not more than one-tenth of which is lost in passing through animals. It is worth as manure three or four times as much as that which we commonly cart from the yard in the

spring. The crop is of very great value for pasture or to turn in as a green crop. The usage of good farmers differs somewhat in the treatment of clover. Some turn in the crop when full grown in June. Others pasture it the first season, and turn in what is left for wheat. Others

let it stand without pasturing, and turn it under for wheat. Others take off two crops, and turn it under the second season. The most intelligent farmers are now favoring the practice of cutting and pasturing through one season, believing that the soil improves more by the growth of the roots. It is a very strong-rooted plant and penetrates the soil to a great depth. The mechanical condition of the soil is very much improved by the decay of these long tap-roots. However used, it cannot fail to bene-

Fig. 2.—PAIR OF BUFF COCHIN HENS.—FROM A PHOTOGRAPH.

fluffy plumage; good-sized heads, with medium-sized, single combs, large wattles and ear lobes, clear, bright eyes, and strong, curved, tapering beaks; breasts, broad and full; long, strong thighs, set wide apart, with short, thick, yellow

fit the soil if the manure that is made from the plant is carefully saved and returned to the fields where it grew. Clover ought to have a place in every rotation. The farmers of the interior and of the South have the means in this

plant of restoring the fertility of their wheat fields, and securing as large crops as the virgin soil yielded. Arrange to sow more clover.

Walks and Talks on the Farm—No. 57.

One of our most extensive stock dealers offers to furnish me 500 good Merino sheep to fatten this coming winter at \$1 a head. He thinks sheep will be lower this fall than ever before known, and that it will be a good time to buy good three-year-old wethers to fatten. "You will double your money before next March," No doubt this is so. But I would a great deal rather double the money on a lot of \$5 sheep than on a lot costing but \$1 a head. In the one case you get \$5 for the feed, and in the other only \$1. The one will pay very well, and the other will not pay at all. And yet you "double your money" in both cases.

Last winter Mr. Surian Winne, of Albany County, fattened 901 sheep, and sold them in the spring for \$12,049.15 net, an average of \$13.37 per head. Mr. W. made some very interesting experiments to ascertain which are the most profitable sheep to fatten, Leicesters or Merinos. He selected 60 Canada Leicesters and 61 Merinos, and placed them in two separate lots, giving to each precisely the same food and general treatment. The experiment continued from February 10th to March 28th, or 46 days.

February 10th, the 60 Leicesters weighed 8,870 pounds.
March 28th, the 60 Leicesters weighed 9,873 pounds.
Gain in 46 days, 1,008 pounds.
Total cost of feed (hay, grain, oil-meal, roots, &c.), for the 46 days, \$174.43.

February 10th, the 61 Merinos weighed 6,909 pounds.
March 28th, the 61 Merinos weighed 7,389 pounds.
Gain in 46 days, 480 pounds.
Total cost of food as above, \$144.78.

Both lots were sold March 31st. The Leicesters brought 10 $\frac{1}{2}$ cents per pound, live weight, and the Merinos 10 $\frac{1}{2}$ cents. These are the facts as published in the Albany Cultivator, the editor of which says:

"A calculation in simple proportion will show that if the coarse wools gained 1,003 pounds at a cost of \$174.43 for feed, the gain of the fine wools at the same ratio, upon an expense of \$144.78, should have been 896 pounds, whereas it was only 480 pounds, or a little more than one-half a proportionate amount as compared with cost. Compared with live weight Feb. 10th, the coarse wools gained 11 $\frac{1}{2}$ per cent in the 46 days, the fine wools not quite 7 per cent."

The results would have been more satisfactory had the experiment commenced earlier. Six and a half weeks is too short a period.

The average weight of the Leicesters February 10th was 147 $\frac{1}{4}$ pounds, and March 28th 164 $\frac{1}{4}$ pounds, showing a gain of 16 $\frac{1}{4}$ pounds, or a little over 2 $\frac{1}{2}$ pounds per week. The average weight of the Merinos February 10th was 113 $\frac{1}{4}$ pounds, and March 28th 121 pounds, showing a gain of 7 $\frac{1}{4}$ pounds each, or 1 $\frac{1}{4}$ pounds per week.

In proportion to live weight the two lots consumed very nearly the same amount of food, as judged by its money value. The actual weight of the food consumed is not given. Thus the average weight of the Leicesters during the experiment was 9,371 pounds, and they consumed \$174.43 worth of food, or \$1.86 per 100 pounds. The average weight of the Merinos was 7,149 pounds, and they consumed \$144.78 worth of food, or \$2.02 per 100 pounds. It will thus be seen that the Merinos consumed a little more food in proportion to live weight than the Leicesters, but the difference is not very striking. The food of the Leicesters cost 44 cents per week per head, that of the Merinos 36 cents.

Each pound of increase cost with the Leicesters 17 $\frac{1}{2}$ cents, and with the Merinos 39 cents.

It is very evident that if we depend for our profit merely on the gain in weight, fattening sheep in winter will not pay. In England lean or store sheep sold for the purpose of fattening usually command as much per pound as they sell for per pound when fat, and from the fact that the business is carried on to an immense extent we must conclude that it is, directly or indirectly, profitable. The turnip crop gives the English farmers a large supply of green food in winter at a comparatively cheap rate, and it is owing to this crop and to the rich manure obtained from its consumption, in connection with oil-cake and clover hay, that they sell choice mutton at cheaper rates than we can.

Fattening sheep in winter has usually been quite profitable in this country. This is owing to the fact that comparatively few farmers had sufficient courage to feed enough grain or oil-cake to make their sheep really fat, and those who selected the right kind of sheep and fed them liberally monopolized the business. How long this state of things will continue remains to be seen.

John Johnston has been a very successful feeder of Merino sheep. He buys three and four-year-old wethers in the fall, feeds them liberally all winter, and sells them about the 1st of March, getting good pay for the food, a large pile of rich manure, and often a considerable sum of money for his trouble. But, of course, if every pound of Merino mutton produced during the winter cost 29 cents, he must buy his sheep at a cheap rate in the fall and sell them high in the spring. He contends that he can make more money as things are in fattening Merinos than in fattening Leicesters. He is probably right; but what he makes somebody else loses. It is evident that the Leicesters will produce more mutton for the food consumed than the Merinos.

The profit of fattening sheep in winter depends much more on getting an additional cent or two per pound in the spring than most farmers realize. If Mr. Winne's sheep had sold for 8 cents per pound, instead of over ten cents, he must have bought them at very low rates to have made any money by the transaction. Thus if his Leicesters weighed 100 pounds in the fall, and he fed them for 20 weeks, they would then weigh 150 pounds, which, at 8 cents a pound, would bring \$12. The food costs 44 cents a week, or \$8.80; so that, to get his money back, he must buy Leicester sheep weighing 100 pounds for \$3.20, or less than 3 $\frac{1}{4}$ cents per pound, and then depend wholly on the manure for his profit. With the Merinos, if they weighed 80 pounds in the fall, and increased 1 $\frac{1}{4}$ pounds per week for 30 weeks, they would then weigh 105 pounds, which, at 8 cents per pound, would bring \$8.40. The food at 36 cents per week would cost \$7.20. So that the sheep must be bought for \$1.20 per head, or 1 $\frac{1}{2}$ cents per pound. If the sheep sold for only 7 cents per pound in the spring we should have to buy a good 80-pound Merino wether in the fall for 15 cents, in order to come out even. If the sheep sold for 6 cents per pound in the spring, or \$6.30 each, and the food cost, as it did in Mr. Winne's experiments, \$7.20, those who are desirous of getting rid of their sheep must give some enterprising feeder 90 cents apiece to take them off their hands!—To go into the business of fattening sheep in the winter, therefore, because sheep are now cheap, and because "you can double your money," would be all very well if it did not cost anything to feed them.

I told you that our cows were very thin this spring when turned out to grass, owing to the fact that we had been feeding corn-fodder up to about the 1st of March, and milking them until within a few weeks of calving. We fed them a little corn meal mixed with water, but they did not eat it very well, and we gave it up after a few days. Contrary to my expectations our cows have never before done so well.

I have a 10-acre field, that, when I bought the farm, was occupied with nursery trees, and had been for four years. After the trees had been taken off I sowed it to peas, and top-dressed it with three or four hundred pounds of superphosphate and other artificial manure per acre. The peas were the largest crop I ever saw grow. We had some forty-four large two-horse loads from the ten acres. The land was full of thistles, but the rank growth of peas smothered them out. After the peas were off we plowed the land twice and drilled in wheat, top-dressing it with Lawes' wheat manure that I got from England. The wheat was a fair crop, say twenty-five bushels per acre. It was seeded down with clover alone, and after the wheat was off, such a growth of clover that fall I have rarely seen. I pastured it down quite bare in October and November, which is perhaps not a good practice, but I was short of feed. At any rate, the next spring the clover started early and produced an immense crop of hay. It was then allowed to grow up, and was cut for seed. This spring the clover grew almost as rigorously as before. We have kept on it, so far, eleven head of cattle, eight sheep, a dozen or more pigs, and for several weeks eight horses. The pasture, although we are having a very severe drouth, is still green and abundant. The Deacon was speaking about it this morning. He thinks it must be "that stuff you put on to it," and he is undoubtedly right, though I have no doubt that the fact of the land having been cultivated for five years with young apple trees has something to do with it. Elwanger and Barry tell me that a dozen years ago it was almost impossible to induce a farmer to rent land for nursery purposes, but now they are offered it every day. Farmers find that when land has been kept in small trees and receives good cultivation for four or five years it afterwards produces splendid crops. It is another illustration of the fact that "tillage is manure."

Our cows are nothing to brag about, and have nothing but this heavily stocked pasture, and yet we get from seven cows—one of which is farrow—about forty-five pounds of butter a week. This week, though the weather is very hot and pastures generally are drying up, we made 43 pounds. This, of course, is nothing remarkable, but still for a run-down farm it is encouraging.

Nobody needs a little encouragement more than the man who undertakes to renovate a run-down farm, especially if he is known "to write for the papers," and if, as I made up my mind to do, he tells of his failures as well as his successes, he may be excused if his mind dwells on the first indications of any decided improvement that he may see on the farm. In this light I think no one will blame me for saying that my crops this year are far better than ever before. We have drawn in about one hundred and forty loads of capital hay, and have still twenty acres of timothy to cut. This is on the old "stump lot" that we cleared up last fall, and plowed for the first time. I intended to have cut it before, but wheat harvest came on so rapidly and men demanded such exorbitant wages that I concluded to let it remain till after harvest and cut it for seed. My operations in

clearing up this land have certainly been successful. We did not plow it till August. Ten acres of the drier portions of the field we sowed to wheat on the tough old sod just turned over. This is the best wheat I have, and the Deacon says: "Don't you be telling about that wheat crop, or you will lead thousands astray; we all thought you would not get any wheat, and if the season had not been so favorable for this kind of low land it would have all winter-killed or *ruined*." Now the truth is, the good crop is not so much owing to the favorable season as to a deep open ditch that I cut through it. On the lower portions we sowed timothy alone. The weather was so dry last fall that much of the seed did not germinate, and it did not start till after the rains in May. And yet I think a good deal of it will cut at least two tons of pure timothy to the acre, and the Deacon says if I harrow it this fall, sow a little more seed, and get out all the pieces of roots that are brought to the surface, so that next year we can cut it with the mowing machine, it will pay better than the best wheat land on the farm. This year's crop will much more than pay for all the labor I spent on it.

As long as labor is so uncertain I think I shall plant but little corn. I never thought that there was much profit in the crop itself in this section. The main object in raising it is to clear the land; but I am not sure if it is not better to summer fallow. Farmers complain of the scarcity of help and of the unskillfulness and idleness of that which they do obtain, together with the high wages demanded. On the other hand, farm men who have families complain of the high prices of everything which they have to buy, and assert (and, I believe, truly,) that they have to be far more economical than before the war. This labor question demands the earnest and thoughtful consideration of every intelligent farmer. That there is something wrong in our present system is obvious. Men receive higher wages for the work done than in any other country in the world, and yet there are, in the older settled sections, industrious, able-bodied, and skillful men who live either in houses of their own or rent them, who are as poor and enjoy no more of the comforts of life than the English laborer who works for half a dollar a day and boards himself. Why is this? It is not the currency; it is not the climate, though this may have something to do with it; it is not owing to any difference in the men. Is it not owing to the want of regular employment?

During the first part of the season I paid my extra hands ten shillings a day, and they boarded themselves. As the season advanced I paid twelve shillings, and promised to do so till the 1st of December. Haying came on before farmers were through hoeing, and harvest long before they were through haying. My men as they came to work in the morning were met by farmers who do not employ any extra hands for more than two or three weeks in the year, with the question: "How much a day does Harris pay you now?" "Twelve shillings." "If you will come and help me to-day I will give you twenty shillings and board." Some of them have strength enough and sense enough and honor enough to resist the temptation, but it makes them uneasy, and those who come say: "John has gone to help Snooks to-day, and gets twenty shillings, and I think you ought to pay me more than twelve shillings." Now, of course no man can afford to pay such wages for any length of time. A farmer who gets into a tight place can afford to pay for a week ten or

fifteen dollars extra rather than have his hay spoil or his wheat shell out, and he can hardly be expected, perhaps, to take into consideration the effect that such extravagant wages have on men who are engaged for the season at reasonable rates. That it has a bad effect we all know. During the very busiest part of the year, when every hour counts, and when, if ever, men should try to do two days work in one, they are the most independent, most dissatisfied, and most inclined to shirk. It is not that there is a scarcity of men. Every month brings thousands of stalwart Germans to our shores, and the cities are crowded with people out of employment. There are men enough to do all the work, provided their labor could be economized and properly distributed through the season. These men who get such high wages for a few days do not like to settle down to steady work at reasonable rates. The consequence is, they are idle half the time, while many things that could be done profitably with labor at ten shillings a day are left undone because the men refuse to work for less than twelve shillings or two dollars. Occasionally they get jobs at such rates of payment, and are thus able to eke out a scanty and uncertain livelihood.

Education for Farming.

Summer work has occupied the minds and hands of the young men and boys of the country, and by this time they begin to see their way through, and many are thinking what to do for the winter. The crops are to be harvested, and when this is done, the work will be such that fewer hands will do it, and the boys can be spared to go to a trade or to school. There is a great demand for the labor of good mechanics of almost every trade, many of whom are now getting very high wages. The country is growing rapidly, and though, as a rule, American journeymen are by no means thoroughly accomplished, like the mechanics of Europe, yet there is work enough for them, and they rise rapidly if industrious, sober, and intelligent. This makes the trades very attractive to young farmers, and the mechanic arts will always draw their recruits largely from the farms. The farm, however, offers greater inducements to really intelligent labor than either the trades or the mercantile professions, and young farmers should plan how to best spend the winter for their improvement in their profession.

The farmer without an education for his calling remains a sort of drudge wherever he is, and he stands no higher in society than a mere hand-worker ought to. Properly educated for his business he elevates his profession and himself exactly in proportion to his intelligence and general culture. Facilities for agricultural education are greatly increasing over the whole country, and it would be well for farmer-boys to see if they cannot in some way take advantage of them, even if they can do no more than attend a single course of lectures. The advantages to be gained would be some information which could hardly be acquired in any other way, a knowledge of where to obtain information from books and from other sources, and finally, how to make knowledge available. The Agricultural Colleges of Michigan and Massachusetts, the Scientific Schools of New Haven, Rutgers and Dartmouth Colleges, offer such facilities. The Cornell University, with its unrivaled advantages, the University of Kentucky, and several other institutions, open their doors to those who would base their agricultural

practice upon a broader foundation than that of their own and their fathers' experience.

Our successful commercial men, merchants, manufacturers, bankers, brokers, shippers, etc., as soon as they acquire wealth which they do not need in business, immediately buy country seats, or farms, which they have worked under their direction, or upon shares, either for the sake of drawing articles of daily consumption fresh from the fountain of natural supply, or to be used as summer retreats from din and dust, or for the profit they hope to gain by the rise in value of the land. Thus there is and will be an increasing demand for intelligent young farm managers to superintend with profit to the owner these estates. Good salaries will be paid for educated brains, and this demand, as soon as it is felt upon the farm, will keep our agricultural colleges and lecture rooms full of attentive pupils, who choose farming as their trade.

Should Cows Have Food during the Night?

A young farmer asks: "Do you think that cows should be turned into a small enclosure when milked in the evening, and kept there without food or water until after milking in the morning?" We think not. At all events they should have access to water, and if they could have a good feed of green food, say corn fodder, they would give enough more butter to pay for all the cost twice over. In experiments made on the Royal Agricultural College farm, at Cirencester, the average composition of milk was ascertained during each month. The results for September and October were as follows:

		Water	Butter Fat	Protein	Carb. Food	Albumen	Milk-sugar	Ash
Sept.	Morning.....	89.91	1.99	3.94	4.48	0.14		
	Evening.....	90.70	1.79	3.81	4.04	0.06		
Oct.	Morning.....	87.60	3.90	2.87	4.84	0.79		
	Evening.....	90.30	3.99	2.37	3.76	0.58		

Dr. Væleker, in commenting on these remarkable results, states that the cows in September were out in "a pasture, poor and overstocked, so that the daily growth of grass furnished hardly food enough to meet the daily waste to which the animal frame is subject, and was not calculated to meet an extra demand of materials for the formation of curd and butter." In October, "on account of the deficiency of the herbage, the cows were in the evening driven into the stall and there supplied with hay, roots, and meal. The milk became better at once; for the morning's milk then contained 12½ per cent of solid matter, and in this nearly 4 per cent of butter. [The Dr. does not mean exactly what he says. It was not the solid matter that contains 4 per cent of butter, but the milk itself. The solid matter contains over 31 per cent of butter.] The concentrated food which the cows were fed at evening was clearly made into good, rich milk during the night."

In regard to whether it is best to allow the cows to run in the pasture during the night, or to shut them in the barn-yard, there is a difference of opinion. But we apprehend the present custom arose from the greater convenience of having the cows in the yard ready to milk in the morning, instead of having to go through the wet grass, or sometimes into the woods, in search of them. We think there can be little doubt that they would do better in a good pasture during the night than in a pen. A better plan, however, is to feed them in the yard.

This is a standing argument for feeding low—say all the straw and hay they will eat, with a few nubbins of corn, five or six weeks before

they come in. There can be little doubt that, as a general rule, cows are not fed high enough during winter to afford the best results during summer. A cow kept in a comfortable and well-ventilated stable, with abundance of nutritious food, will be healthier and better able to stand the strain on her constitution at calving, than if kept on a low diet; and there can be little doubt that, with a cow of the right sort, all the fat that is accumulated while she is dry will find its way to the pail during the summer in the form of butter. In the dairy districts wintering a cow is expensive, even on the poorest description of food, and it is a short-sighted policy to stint her, as we thus lose the whole benefit of her existence during several months. It is just as important to feed her well while she is dry as while she is giving milk. Of course the matter may be overdone, especially with cows not adapted to high feeding, but as a general rule, there is very little danger in this direction.

will soon be followed by great interest in rotation of crops. This, indeed, is already becoming the theme of thought and discussion among wide-awake men. To get the best crops we must have manure. The crops must be converted into beef or money, and manure. To get the most manure and the best and cheapest beef, we must have barns; while to make the best use of the manure and secure clean culture, we must adopt a rotation of crops. Our Western friends are, perhaps, too apt to measure the merits of a barn by its size, its substantial framing, and good finish. The criterion of excellence should be convenience and adaptation to its uses.

Mr. Wm. B. Collier, of St. Louis, has lately erected a fine barn on his estate, in New Mexico, Adrian Co., Mo., and as it is regarded by well-informed people as the best barn in the State, he sends us a photograph and ground plan. The plan is a modification of that of the barn of Rufus J. Lackland, St. Louis Co. It was occupied January 1st of the current year, and with a large

The building stands upon 54 stone pillars, and has a tight board floor, any part of which may be easily renewed, as occasion may require.

Foul Water in Wells.

Some wells furnish periodically water unpleasant to the taste, and doubtless unwholesome. The bad taste usually comes out in the summer at low stages of water, and disappears with the winter rains, when the wells are full. This occurs when the temperature of the water is raised sufficiently to allow the moderately rapid decomposition of organic substances which might otherwise remain without giving any hint of their presence. These substances may be derived from several sources; the most usual is from leaves and small animals falling into the well. In examining one of these tainted wells recently, we found that a lead pipe had been put into the well leading very near the sink drain, and the filth of the sink followed the outside of the pipe into the well. Sometimes other causes of pollution are in close proximity. We cannot be too careful in securing pure water for family use at all seasons of the year. Quite often the secret of disease is found in the well. Temporary relief may be found in the use of charcoal, but this does not relieve the heads of the family from the responsibility of ferreting out and stopping the cause. Throw a peck or half bushel of good charcoal on the fire; let it get partially ignited throughout; then take it out, crack the large lumps, and put it immediately into a wet gunny bag or any wet sack of coarse, open stuff. Put into the bag, also, a stone weighing 10 pounds or more, and, attaching a cord, lower it to the bottom of the well. Churn it up and down a few times, and after an hour, repeat the "churning," and this time fasten the cord so that the bag will hang near the surface of the water. Repeating the operation in a few hours the water will probably be sweet and healthy for several days.

Fig. 1.—MISSOURI BARN.

Barn Building at the West.

The barns of the West have hitherto not been models either of architectural style or practical utility, which could be held up for imitation. Of late, however, we know of a great awakening taking place on the subject of barns, and

and wagon-rooms on each side the floor are 20 feet square each. Two large loose boxes are for the accommodation of the stallions "St. Louis" and "Pilot Temple"; and from the sketch sent we judge that the various passageways between the rows of stalls, and at the rear of them, must be more than 4 feet wide, while

we make out the horse stalls to be nearly 6 feet, and the stalls for two cows to be nearly 8 feet in width. The two spaces enclosed between dotted lines on the barn-floor indicate the position of the hoistways for hay and grain, under the skylights. The spaces at either end outside these hoisting spaces are floored over above the great doors, and are to be finished off as granaries for keeping the stock of oats, meal, etc., required for the stock. On each side of the barn is a rain-water cistern, 12 feet 9 inches in diameter, and 25 feet deep; these are connected by a pipe, passing underground across the front of the barn. There are seven windows on each side, and six besides the five sliding doors, in each gable. These, with the three great ventilators, afford unusual provision for pure air. The cattle are, doubtless, as we judge from the arrangement of the plan, fed from the floor above. The passage between the rows of horse stalls is for feeding.

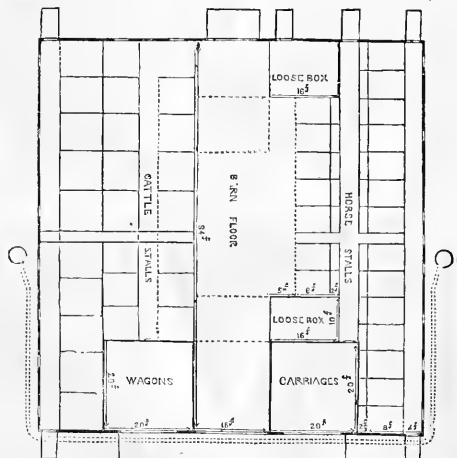

Fig. 2.—PLAN OF BARN.

of manure, two subjects than which none more important can be discussed, and which

The Lance-head Hoe.

A few weeks since our good friend James P. Swain, of Westchester Co., brought into the office three hoes like the one engraved, and the very same day we received a letter from "P." of Gloucester Co., N. J., which we give in part below. The hoes brought in by Mr. Swain seem to have been made exactly after the pattern described by "P." so much so that we in-

LANCE-HEAD HOE.

quired into the matter and found the gentlemen to be entire strangers to each other, and that Mr. Swain had originally made his hoe in his father's blacksmith shop some 50 years ago. These hoes are quite distinct from the common bayonet hoe, being 4½ inches long by 2½ in

width, made of good steel, very light, very sharp, and balanced on a line with the handle. We never before employed so handy a tool for surface working of the soil where it is not very stony. It picks out weeds close to, or in the carrot row almost, and often quite as well as a pair of fingers; it sweeps through the crust of the soil, cutting every weed and letting it stay where it stood. Held at a different angle it turns off quite a furrow, which may be directed against the row or up to a "hill." It works around a hill of corn or beans in an affectionate sort of way, the point entering to nick out a weed or two, and the blade whisks about, loosening the soil and cutting off the weeds, and though out of sight is in no danger of doing any injury—the "goose-neck" being turned toward the plant. The handle is very light, and might be best made of clear straight-grained pine, for it is, or should be, subjected to no hard blows. "P." writes as follows:

"I have seen nothing that suits me better for stirring the ground between plants, loosening hard soil, and even for chopping up deep-rooted weeds and tufts of grass, and scraping the top soil, than the spear or lance shaped hoe. A few years ago I went to a blacksmith and described to him what I wanted. He took a worn-out, flat, shoeing rasp, and broke it in two in the middle, and from one-half of it soon forged me a very complete tool, sharp and thin at the edges and point. I ground it up quite sharp on the side edges, leaving the back or middle thick, the inside flat, about in the shape of a spear head cut or split in two flatwise. After a use of three summers it is but very little worn, and seems to be the favorite tool of the garden. For replanting corn and truck seeds generally, it is splendid. It cannot be excelled for ease of working and completeness, and by using the side, it is a fine affair for scraping the top of the ground and killing weeds just starting."

Remedy for Canker Worms.

We published last year, page 102, Ralph Robinson's method of destroying the female moth of the canker worm. That had the merit of cheap materials, but was expensive in the item of labor. In a recent conversation with John

PROTECTION AGAINST CANKER WORMS.

G. Barker, of Cambridge, Mass., he gave us the details of a plan, which he has applied to the orchard of which he has charge, for the last two years, with entire success. He is indebted for the idea to Elijah Luke, an amateur horticulturist, of Cambridgeport, Mass. To prevent the moths from ascending the tree, he incloses the trunk with a rough box, fig. 1, about 15 inches deep, of sufficient size to leave about 4 inches

between the inside of the box and the nearest points of the trunk. The box is set on a level, and the lower edge 3 inches in the ground. The space inside the box is packed with tannbark, to prevent the moths from ascending within. About 3 inches from the top of the box on the outside, he fastens a V-shaped trough made of zinc or some cheap metal, as shown in the illustration. A tinman is needed to solder the corners, and make the trough tight all round.

The trough must be on a water level. He then puts into the trough about one pint of crude Petroleum, which is very destructive to insects. This article is comparatively cheap, about 25 cents a gallon, and does not readily evaporate. Over the trough he fastens a zinc lid upon each side of the box, with a screw in the middle of the lid, which projects 3 inches beyond the trough. This protects the petroleum from the weather. It is fastened by a screw for convenience in removing to pour in the oil, or to remove insects, lest the trough be clogged. The boxes are put around the trees, and the troughs filled the last of September, and are kept there as long as danger threatens from this pest. The cost of the boxes and troughs is about two dollars per tree, and they are good for a great many years if well made. The saving in labor from the old method of tarring is very great. After the oil is put in, there is absolute security, with only a rare visit to the trees to see that the troughs are not filled with the moths. We are assured by Mr. Barker that his success has been complete in the midst of orchards that were made bare by this insect. He has raised apples enough in the last two years of dearth to more than pay for the expense of the boxes. In Vol. 24, page 366, Mr. David Lyman describes a device for preventing the ascent of the moths. It is a tin cylinder suspended around the trunk a few feet from the ground, by means of a short cotton bag, which is tied firmly to the tree. The lower edge of the tin is smeared with a mixture of castor oil and kerosene, which requires frequent renewing. This is a cheaper contrivance, but requires more labor in watching and attending to it.

A Durable Stone Fence.

The great objection to the old style stone fence, whether built single or double, was its want of durability. Unless the foundation was put below frost it was soon thrown out of line, and in a few years gaps were made in it every winter, and much labor was expended for repairs. It was, indeed, a better fence than one of rails, for the material never rotted, and it did not need resetting so frequently. It was always expensive, and would never have been so extensively built but for the convenient market it made for surface stones. The rock lifters, of which we have two, at least, mounted upon wheels, have introduced a new style of heavy wall that can be cheaply built, and will last forever. These machines will draw boulders deeply imbedded in the earth, weighing six or eight tons, and, with a single yoke of cattle or span of horses, will lay them in the bed of the

wall. The smaller boulders are put in their position without any straining or lifting, and a wall of five or six feet high, embracing three tiers of stone, as shown in the illustration, can be laid by the team and two men. The interstices have to be filled up with smaller stones, and the large stones sometimes need blocking to make them bear perfectly. The largest boulders are five or six feet across, and this is the width of the wall at the bottom, as usually

WALL OF HEAVY STONES.

made. The stones next in size make the second tier, and the smaller ones form the caps. A wall of this kind with a four-wheeled machine can be laid up for about \$2.50 a rod, including the digging of the stones. The most expeditious method is to lay the stones as fast as they are dug, as this saves the labor of hitching on to them and raising them a second time. If properly laid, no frost will ever disturb such a wall, and it will last until the boulders crumble. Thus very rough pastures are economically cleared and fenced, and turned into smooth, productive meadows. The stone pulling is a very thorough subsolling, and the effect is visible for many years.

Tethering Cattle in Grazing.

The tethering of cattle to save grass, except upon the smallest scale in yards and orchards, has never been pursued in this country. Land is so cheap, and grass so abundant in summer, that no need of it has been felt. In the region of cheap lands there is, perhaps, nothing to be gained by a change of the present system of promiscuous pasturage. But in some of the older States, and especially in the vicinity of our large towns, where land is worth \$300 an acre, and upward, we think the system of tethering might be adopted with advantage. In the unrestrained grazing of fertile lands much of the

TETHERING DIAGRAM.

grass is destroyed for feed by trampling and by the droppings of the cattle. We have seen in the grazing districts rich meadows, that would make two or three tons of hay to the acre, devoted to fat cattle. They are all unequally

cropped, in many places badly matted with manure and with a rank growth of grass that the cattle do not relish. This, of course, fertilizes the soil for another year, but it is dear manuring. The great objection to soiling, which saves everything that the soil produces, is the large expense of cutting and carting. It is claimed for tethering, by those who have tried it in England, that it economizes feed almost as closely as soiling, while it saves much of the labor. The system pursued by Mr. Dumbrell, of Ditchling, near Brighton, England, is as follows: Stakes about 18 inches long are driven down into the ground at the outer edge of the field to be grazed, 32 feet apart. These stakes are furnished with chains 12 feet long, with a swivel in the middle, and each cow has a leather-headed halter four feet long, furnished with a T to fasten it to the chain. This gives each animal a sweep of 32 feet, and this is the breadth of the swath that she cuts across the field. She is not permitted to run at will over the fresh grass, for the stake is only moved about a foot at a time, and the cow grazes the new grass in a semicircle, as shown in the illustration, without being able to get her feet into it at all. The chain serves the double purpose of fastening the cows and spreading the manure. The herd graze regularly side by side, like a company of mowers, and are moved as often as may be necessary to give each one full feed. Thus all the grass is consumed, and the field is gone over about three times in a season. Mr. Dumbrell supplements the grazing after July by other green fodder,—tares, mangold leaves, turnips, and cabbage. He estimates that eight or ten acres of grass, with these additions in the latter part of the season, will supply 25 cows. The advantages of the system are great economy in feeding, uniformity of food, in quantity and quality, and economy in fertilizing. Land to be grazed in this way, of course, should be kept in the highest condition. The cost of attendance is the same whether it yield one ton of hay to the acre or six. The cows should be stabled at night, and the liquid manure saved and applied to the grass soon after it has been grazed. If fed exclusively by cows, the fall top-dressing should be from the sties or from artificial fertilizers, that the land may have the advantage of a variety of manures. The mode of tethering is a matter of considerable importance. The common mode, by fastening the rope or chain to the horns, head, or neck, is objectionable, as the tether is likely to get foul and prevent the animal from feeding, or inflict serious injury. If the tether be attached to the hind leg, using a broad leather band made for the purpose, the danger is very much diminished, and the restraint is soon quietly submitted to.

Barn-yards.

Manure ought to be prepared and kept under cover, but there are very few farms where this can be done without a greater immediate outlay than can possibly be made. The majority of us must therefore be content for a while to keep the manure and make it in the open yard. If not content with this state of things, nevertheless we must submit to it with all its losses and inconveniences, and do the best we can to avoid the evils. The problem is, to make the greatest amount of good manure with the stock we keep. The shape of the barn-yard, both in regard to its ground plan and its surface, is of the greatest importance. The yard must, of course, be adjacent to one or more stables, and by far

the most convenient arrangement is to have the barns or sheds used as stables on the whole of one side, and on parts of two others—for thus shelter is afforded to both stock and manure against prevailing winds, and the cattle have warm and sunny quarters, if the north, east, and west sides are thus closed.

The yard must not receive any water except that which rains directly into it, and for this we must make provision, that in flowing away, it cannot carry valuable manure with it. The water from the eaves of the surrounding buildings must be conducted off, and as evaporation under our summer sun is much in excess of the rainfall, it is well to have a portion of the water stored in cisterns, so that the manure heaps may never lack moisture should the natural sup-

Fig. 1.—SECTION OF BARN-YARD.

ply fail. The annual rainfall in the United States varies considerably in different portions, the total in New England averaging about 41 inches; in New York, 36 inches; in the other Middle States, 40½; in Ohio, 40; in the other Interior States, 30 to 40; in the Southern States, 51; and, as a rule, the greater the rainfall the greater the evaporation. The great bulk of the rain, however, falls at a season when there is the least heat; hence there will inevitably be a great accumulation of water to be provided against during the winter and spring months.

An inch of rain often falls during what would be called a hard shower, lasting two or three hours. Protracted storms lasting several days give often no greater results, while it requires a very hard rain to give two to three inches of water. Nevertheless storms probably occur every year in which this (3 inches) is exceeded. If one inch of rain falls in a barn-yard 60 x 60 feet, it will be equivalent to about 72 bbls. of 31 gallons each. A tank 8 x 10 feet, 4 feet high, will hold 77 bbls.; consequently such a tank, if empty or nearly so, would collect and save all the rain of a pretty hard storm, falling in a 60 x 60 yard.

We give herewith a cross section of a barn-yard, figure 1. It exhibits the yard from fence to fence, so arranged that no water can run in or out. The space next the fence or buildings all around is level or nearly so. The interior space has a slope of about one foot in fifteen towards the middle, where there is an 8 x 10 tank laid in masonry, and covered with rails and the manure pile. A simple pump is set in the tank to distribute the manure water over the heap, of which outlines indicate the different sizes it may have. Into this tank flows the urine from the stables and all the water which falls into the yard, and is not absorbed. The overflow is provided for thus:—When the water reaches the top it flows out through the siphon, an enlarged view of which is given in figure 2. This takes the clear liquid below the floating straw, etc., and above the sediment of the bottom; and the water is rapidly drawn off until its level reaches that of the outer end of the pipe (B), when air enters at that point, and the flow ceases, until the water again rises to the top. This overflow may first run into a hogshcad and afford a convenient supply for watering the garden, and,

after this is full, flow off into a pit filled with muck or peat, through which it may soak into the ground leaving most of its valuable ingredients held fast by the peat for future use.

To carry out a plan of this kind considerable expense would be necessary. The barn-yard would have to be graded carefully and made impervious to water, or nearly so. Were the water to flow from the tank into a part of the yard below the level of the top of the tank, and filled with muck, sods, peat, weeds, etc., the evaporation during most of the year would prevent any loss from the flooding of the yard; but in winter it would probably overflow unless the soil were sufficiently porous to let the water through. No harm would come of this if a sufficient bed of muck were present.

When the tank is covered by a well-made compost heap, and this is kept constantly saturated with water, a very large quantity of water will evaporate, so that the farmer will be troubled

by a lack much oftener than by an excess of water in his yard. Even during the winter the heap being in a condition of constant fermentation is always warm, if not hot, and a vast deal of water will be thrown off. If properly managed and the manure be allowed to get neither too dry nor to be drowned with water, manure making will go on with astonishing rapidity.

A Field for our Agricultural Colleges.

Colleges to make farmers are not popular in this country. Those which have been started and endowed with government grants have met with a very limited success. With two or three exceptions they have not attracted pupils to any considerable extent, and appear to have made no impression upon the community of cultivators. The farmers seem not to have any appreciation of the privileges offered for their sons, and the professors have not hit upon the right methods of making scientific agriculture available for the masses. Farmers, as a rule, read and think more than they did twenty years ago, but the great majority are still in doubt whether the business pays, and generally educate their children for other callings. Most of the pupils in our agricultural schools, we are informed, are not the sons of farmers, and have no definite purpose to live by the cultivation of the soil. Yet there is great need of a class of young men in this country which these colleges ought to furnish. In Europe there is a constant demand for intelligent foremen to manage large landed estates, and it is the aim of the agricultural schools established there to meet this demand. There is a call for such men here, but no one knows where to find them. They were needed upon the large cotton plantations of the South before the war, and the want was imperfectly met. Though knowing nothing of the science of cultivation, the overseers did understand the rude methods of raising cotton which prevailed there, and the driving of slaves, and were well paid for it. They occupied an honorable position in the planter's family, sat at his table, and, to a considerable extent, shared his social enjoyments. Though the introduction of free labor will make many small farmers, there will still be large plantations worked by superintendents or overseers in the South for a long time to come. And at the North, as capital increases, we look for

Fig. 2.—SIPHON.

the absorption of many of the small farms into large ones, and the cultivation of the land upon a grander scale. There is no doubt that, with suitable capital and skill, a 400-acre farm can be worked much more economically than a farm of fifty acres. It would require no more over-seeing and but little more capital for implements and buildings. The expenses for labor, fertilizers, and stock, would, of course, be much larger. There is an increasing love of rural pursuits in this country, and most men who are accumulating wealth in our cities are purposing to have, at no distant day, a country home. Many have already realized their dream, and are farming by proxy on a generous scale. We were surprised in our trip through the Middle and Western States last summer to find so many bankers, merchants, and professional men in cities, carrying on farms in the suburbs. This we found was generally done by a foreman, residing upon the farm with his family, and boarding the hands. Thousands of men of capital would be glad to do this if they could find suitable men to manage the business for them, and make it pay. They do not understand farming themselves, or have not the requisite time to attend to it. They would be glad to buy the farm and furnish the capital, and pay any man a handsome salary who would wisely direct labor and make the investments pay. Thousands of men properly trained would find profitable occupation as foremen on such places, if they could be had. Here, then, is a field for our agricultural colleges which they ought to enter immediately. And if it were known that they made a business of training practical men to fill places waiting for them, there would be in a short time as great a rush to the agricultural, as there now is to the "commercial" colleges. These institutions would begin to supply a want that is felt, and the reproach that farmers' sons are not found among their students would be taken away. It could not fail to have a very important influence upon the development of our agriculture, and all depending upon it.

Manure the Test of Good Farming.

We farm for profit as a rule, however many exceptions there may be. This profit which we all seek comes from the sale of the products of the land, or from that of animals fed upon them. This divides farming operations into two classes, and determines the nature of them, and the system pursued upon different farms, or upon different fields of the same farm. By far the greater number of farmers pursue a mixed system, deriving their income in part from crops sold, and in part from animal products. With such animal manure is a necessity, and the success of a farmer may be predicated upon the amount he makes and uses. A temporary exception to this rule is seen on some of the virgin lands of the West, and wherever apparently inexhaustible fertility of soil renders manure superfluous. Where a system of green manuring for wheat and Indian corn, with the addition of lime and plaster, and perhaps bone dust occasionally, is sufficient with good tillage to maintain fertility, farmers have an economical substitute for animal manures. This system may often be profitably applied to "out-fields," and occasionally to entire farms. Manure—barn-yard manure, or more properly, barn manure, for the yard is a poor place, at best, to make it—regarding both quantity and quality, must be considered the measure of good farming, and the test of success.

The Abattoirs at Communipaw

New York has an excellent code of sanitary laws, and many changes have been made which tend to sanitary reform. One of the most marked improvements in this respect is restricting the killing of animals to large slaughtering-houses or abattoirs, after the plan followed in European cities. In the engraving on the following page is represented one of the largest of these, the abattoir at Communipaw, N. J. It is located on the New Jersey Central Railroad, about two miles below Jersey City, and nearly three miles from Washington Market.

The building stands upon "made land," and is so arranged that boats find ready access to the side of the building at all times of tide, which greatly facilitates the prompt removal of all offal as soon as it is collected. The slaughtering-house, fig. 1, is 620 ft. long, by 60 ft. wide, with an ell 100 feet in length by 40 feet wide across the end. It is two stories high. Behind this building, and not shown in the engraving, is another building 40 ft. square, which is the sheep slaughtering-house. The first floor of the main building is devoted to the killing of cattle, of which we indicate only the general features. The immense floor of the cattle department is divided transversely into "beds," fourteen in number, each "bed" consisting of a pen for the cattle, a fat-cleaning room, a space of 15 ft. square for killing and dressing, and a drying space to hang the dressed carcasses. Over the portion devoted to killing and dressing the cattle there runs a long iron shaft, which is turned by steam, and is so arranged that all lifting is done quickly and easily. Three men and a boy to help, together with a man to clean the fat, are all that are required to work a "bed" to its full capacity. The drying space in this room is sufficient to hang up 1,900 bullocks at once.

The hog department, fig. 2, is on the second floor of the same building. The hogs, when they arrive by the cars, are unloaded and driven into large pens for their accommodation, in a building 800 ft. long by 100 ft. wide, fig. 1. This building is two stories high. The first or ground floor is used for storing hogs, the second for storing sheep. Each floor is divided into pens of convenient size, which are kept constantly supplied with fresh water; there are troughs and racks for feeding, and the animals are here given an opportunity to rest and eat until killing time. The alley-ways and gates of these pens are so arranged that the animals are lead, rather than driven from the pens, to the slaughtering-house. A view of the gangway leading to the second story is seen in fig. 1. One boy will easily drive 1,000 hogs or sheep.

Arrived at the slaughtering-house the animal finds itself in a pen similar to the one it has just left, and its fear and anxiety are greatly lessened. So rapidly is the act of killing performed that the cruelty which might otherwise occur is almost entirely done away with. In the bleeding department, fig. 2, three men and a boy are required. The hogs are seized by one of the hind legs, and by means of a short chain suspended to a hook, which has a wheel so arranged that it will run in a circular track stationed above the pen, fig. 2. As soon as the animal is secured it is passed around by means of this track to the "bleeder," who sticks it in the usual manner and passes it on to the boy, who stands ready to loosen the chain and let the hog down into the scalding tank as soon as dead. The scalding tank, fig. 2, is 12 ft. long by 5½ ft. wide, and requires two men as "scalders," to tend it.

As soon as a hog is ready, it is caused to float upon a sort of fork that works by means of a lever, and is thus rolled upon the scraping table. At this table, which is 20 ft. long by 5 ft. wide, stand 14 men, seven on each side. The first two take off the bristles and long, stiff hairs, which are saved in barrels. The animal is then passed to the next eight, four on each side, who are designated "scrapers"; they take off the bulk of the hair, and pass the hog along to the last four, who are called "cleaners"; these clean the head and feet, and more difficult parts. At the end of the table stands a man known as the "gambrel cutter," he puts in the gambrel and again the hog is suspended on a circular railway, as before. It is at once passed along to the "gutters," who stand at the end of the fat-cleaning table. Their duty is to take out the intestines, liver, heart, and lungs, which is all done at once, and deposited by them on the fat-cleaning table, where six men are employed for that purpose. The hog is next passed to the washer, where it is thoroughly washed and scraped down with a large knife. The carcass is now ready for the drying-room.

At the head of the drying-room there is a one track railway, along which is run, on a wheel and hook like the rest, a two-pronged lever or fork. This fork is so placed as to lift the hog by the gambrel and transport him from the dressing-rack to any one of the "slides" in the drying room. It is then placed in the slide, pushed back close to its felloe, and left to drain and cool, fig. 2. The hog slaughtering-house is divided into six compartments, similar to the one described, and the drying-room has hangings or slides for six thousand hogs at once. The fat as fast as it is cleaned is carted by means of box trucks to the rendering tanks, which are ten in number, and each of which has a capacity sufficient for the fat from one thousand hogs. The lungs, hearts, and livers, together with all the rough fat, are also put into rendering tanks, especially kept for that purpose, and the "lard" thus obtained is used for making oil. The steam arising from these immense tanks of boiling fat is made to pass through escape valves into a long coil of iron pipe, which is immersed in a large tank of running water. Here the contained steam is partly condensed. From this tank a pipe passes some three hundred feet out into the Bay, where the steam and gases escape under water. No disagreeable odor ever arises from the fat department.

The offal and blood as fast as accumulated are taken by box trucks to the barge-gangway, where a boat is at all times ready to receive the refuse matter. This offal is here thoroughly mixed with deodorizers, and removed every night to the Passaic River Guano Factories, where it is used for the purpose of manufacturing fertilizers. After the day's work is done at the abattoir the whole floor of the slaughtering house is flooded with water and thoroughly washed. The washings escape into the Bay by means of gutters and pipes, and are carried by the tide far out from land. This abattoir was erected at great expense, and for the first year, owing to a prejudice on the part of the butchers, was but little used. But since the Board of Health has been sustained by the courts in its decision, that no slaughtering should be done in the built up portions of New York, the business has increased, and it is now running nearly to its full capacity. The advantages of an abattoir of the kind here described are so great that no city or large town should allow slaughtering to be done in any other manner.

The Amaranth Family.

The name Amaranth means undying, and has been applied by ancients and moderns in poetry without meaning any particular flower. The Amaranth Family of the botanist comprises many plants that would hardly find a place in poetry, or even in horticulture, for it includes several very unpleasant weeds. Yet for a certain kind of decoration, that of large grounds, the Amaranth family comes in play. We do not propose to go into a botanical description of these plants, for their characters need enlarged figures. Their general habit is known by several homely weeds, and that of the ornamental section by that common ornament of country door-yards, the Love-lies-bleeding. Of the cultivated members of the family, perhaps none is better known than the Cockscomb, (*Celosia cristata*), which has attained the dignity of a florist's flower. In the English shows the Cockscomb plays an important part, and wonderful accounts are given of the size of its singularly aggregated heads. Other *Celosias* are grown in which the flowers are not compacted as in the Cockscomb. The genus which gives the name to the family Amaranthus (the family is called *Amarantaceae*) comprises not only some troublesome weeds but some ornamental plants. *Amarantus speciosus* is a native of Nepal, and forms dense, dark red, or purplish heads, piled up in the manner shown in the engraving. For large grounds it makes a fine show late in autumn. An old plant, which has been crowded out by others of less merit, is the "Joseph's Coat," (*Amarantus tricolor*), which in its foliage presents red, green, and yellow. In the demand for plants with brilliant foliage we do not know why this old friend has been overlooked, for there is nothing more showy. Perhaps being an annual, the florists, as it "will not cut," have not encouraged its cultivation. Among the Amaranths is the *Amarantus sanguineus*, which has a beautiful dark red foliage, and which well deserves a place among ornamental plants. All of the Amaranths are annuals, and their seeds

are to be had of the seedsmen. We mention them now as this is their season of bloom. The engravings we have given of *Celosia cristata*, *Amarantus speciosus*, and *A. tricolor*, are from drawings by the great French artist, Riocreux, and are as close representatives of the plants as can be, without the color. The plants of this natural family all bear the highest culture, flourishing best in deep, well-enriched soil, in the hot sun. After getting a good start they rapidly take and hold possession of the ground, disputing it with our most ravenous and hardy

Fig. 2.—JOSEPH'S COAT.—(*Amarantus tricolor*.)

The Fault of Town Gardening.

In our travels about the country we notice one glaring fault in all the town and village flower gardens, and that we can express by no more appropriate name than "legginess." Everything is run up and drawn up to its utmost, with the exception of those plants which do better when trained up, and they are left to branch from below at will. Let us take as two examples, the Pelargonium (Geranium) and Heliotrope, which are among the most common plants set out for garden decoration. The geraniums, whether the rose geranium, grown for its fragrant leaves, or some of those prized for the brilliancy of their flowers, or the showiness of their variegated foliage, are often badly wintered plants, a tuft here and there of foliage set upon long, leggy branches, which never come into shapely plants. In plants like these, people seem to lack courage to pinch. There is nothing more tractable than a Pelargonium (geranium) of any kind. A house-grown plant may be made a dense bush by pinching, and a bit of a plant received from the green-house in spring may be left to grow into a "leggy," shapeless thing, or may be made, by proper pinching, to assume a pleasing form. Many people who grow plants and love them, lack the courage to do that which will be for the plants' good. A neighbor of ours has a lot of plants, all at sixes and sevens, and though we almost daily advise the use of the knife, he lacks the courage or the faith to apply it. The Heliotrope, when put out, often becomes a nuisance. Some branches start out near the base and grow a long distance before they show signs of flowering. Keep the Heliotrope pinched in as to its lower branches, growing it as a little shrub, and it will give an abundance of flowers all summer. By proper attention to the plant in the borders it may be kept in a good shape for potting for winter flowering, but as generally grown, it has a great number of long, weak branches at the base, and when it is potted in fall it is usually worthless. Timely care is the price of comely plants.

Fig. 3.—AMARANTUS SPECIOSUS.

of life are they that plants barely in blossom will, if cut up, in many cases ripen their seeds.

Fig. 19.

Fig. 20.

The Grape Vine—How It Grows and What to Do with It.—8th Article.

A notice of the more common systems of training the vine requires a mention of the Bow system, as it is one practised in a large number of vineyards, especially at the West. This method is a favorite one with the Germans, and though it is not to be advised where a better plan can be followed, it has the advantage of requiring but little outlay. The vines are trained to stakes, and being but little extended, may be planted closer than when some of the other systems are adopted. In starting the bow, a vine with two strong canes is first established in the manner heretofore described. The canes being strong enough to bear fruit, one of them is cut back to two or three buds, and the other is pruned longer, leaving eight to twelve, as in

end is brought around so as to make a more or less complete circle. The shoots from the buds on the short arms are trained upright to the stake, to form canes for another season; while the buds upon the bow will throw out fruit-bearing shoots, which are pinched at two or three leaves beyond the last bunch of fruit, as shown in figure 21, in which the leaves are omitted, to better show the arrangement of the vine. After the bow has fruited, it is cut entirely away at pruning. One of the upright canes is taken to replace it, while the other cane is pruned to a short arm of two or three buds, to supply uprights another year. The resemblance of the bow training to Guyot's system will be seen by a comparison of the figure given in July last with the one here shown. In both, we have a vine with one long and one short arm, the short one being intended to furnish a yearly supply of fruiting canes; and the main difference is that in the case of Guyot the long arm is kept horizontal, while in the other it is curved. The bow system is sometimes practised upon trellises, with the advantage that the vine is less liable to be beaten about by the winds. An illustration of this kind of training, as followed by Mr. Hismann, is seen in figure 22, taken from his work upon the grape. The right-hand vine is represented as it appears in autumn. A

Fig. 22.

and C show where the cuts are made at pruning, and the cane B is shortened to a proper length to form the bow, as seen in the left-hand vine.

The *thinning of the fruit* upon the bunches should not be neglected if the habit of the grape demands it. Most of the varieties grown in the open air do not require it, but a few make the bunches so compact that it is impossible for the air to circulate freely among the berries. These must be thinned, sometimes repeatedly, to secure the best results. The thinning should be done with a pair of sharp pointed scissors made for the purpose. From one-fourth to one-half of the berries should be taken out from different parts of the bunch, so as to leave it of symmetrical shape, and give each berry room to fill.

Greens in Summer.

One accustomed to a good variety of vegetable food is struck with the paucity of this he meets in traveling about the country, not only at the tables of farmers but at the hotels in small towns. Potatoes, beets, onions, peas and beans in their season, make up a larger variety than is usually to be found. To add to these a frequent dish of greens would be an easy matter. The variety of beet known as Chard or Swiss Chard is most excellent for this purpose, and we wonder it is so little cultivated. It is a beet, the root of which is worthless, and it is grown only for the leaf. The leaf-stalk is broad and thick, and the leaf itself fleshy, tender, and succulent. There is a red and a white variety. The cultivation is the same as that of the common beet, but the plants should not stand nearer

than a foot apart. A rich, moist soil is best. In gathering, the outer leaves are pulled off, leaving the inner ones to develop and keep up a supply. The leaf and leaf-stalk may be cooked together, or the stalk may be separated, boiled, and dressed like asparagus, and the leaf cooked like spinach or other greens. A single trial will commend this to every lover of greens.

The Saving of Garden Seeds.

Many of the seeds are sufficiently matured this month, and the work of saving them should be begun before they burst their pods, and are lost. It is quite possible to save better seeds than we can buy, and the habit of carefulness in studying the habits of plants secured by growing our own seed will be worth much more to us than the value of the seeds. All our garden plants have been greatly improved from their originals, and none of them probably have reached the limits of their perfection. They can be made to mature earlier, and to produce more abundantly, as those who have made experiments have learned. If the first well-developed seeds of a plant be selected and sown for several years, the offspring will mature earlier, and eventually a new variety will be

secured with a fixed early habit. If we select the longest pods of a bean and plant the seed, we shall find the crop true to its parentage, and a more prolific sort will in time be established. It will take time and patience to secure desirable changes, but there is very great satisfaction in seeing our labors result in permanent improvements in our vegetables. It is a little more trouble to save the first mature cabbage, turnip, or beet seed, and to keep it by itself, but

it will pay if one can get a variety that will ripen a week earlier. It is particularly important to hasten the maturity of plants of tropical origin, melons, squashes, cucumbers, tomatoes, egg-plants, etc. Select seeds from the earliest perfect specimens and mark the result. Experimental plants should have the advantage of good soil, a southern exposure, and frequent cultivation. A plant with a predisposition to ripen its fruit early would not have a fair chance in a cold clay soil, or upon a northern or western exposure. If we mean to fix the habit of early maturity, all the circumstances must favor the growth of the plant. Aside from the influence which the saving of our own garden seeds will have upon the improvement of fruits and vegetables, the habit in itself is a good one. It is exceedingly convenient in the hurry of the spring gardening to know just where you can find every package of seed you want to plant, securely tied and labeled, with the name and date of gathering. For this purpose let the good housewife make up a few dozen paper bags, and have the packages stored away in the seed box as fast as they are secured.

LILIES.—A bed of hardy lilies is about as satisfactory as any thing one can have in the garden. The Japan Lilies are now quite common, and we have sent them far and wide as premiums. The grand Golden Banded Lily, which at first sold for \$40 a bulb, is now to be had for less than a dollar. Besides these there are varieties of *Lilium umbellatum*, all quite early; *L. excelsum*, with its crown of flowers so

Fig. 21.

figure 19. The longer cane is made to form the bow, and is tied to a stake, as in figure 20, or the

delicately tinted that one is at loss for a name to describe the color; and the Long-flowered lily, *L. longiflorum*, low-growing, with long flowers of the purest white. All these are perfectly hardy. In making a collection do not forget our native species, so often entirely overlooked.

A Holland Mole Trap.

A short time ago we noticed in the grounds of a horticultural friend a remarkably rustic mole trap. The gentleman's gardener, "Pete," was formerly in the bulb gardens of Haarlem, and the contrivance in question was the same used there, and which adds essentially to the wages of the workmen on the bulb farms, as a bounty is paid for the destruction of moles. The trap is made of rough sticks, which can be cut from any kind of brush, a string, and a few feet of fine wire. The illustration will show the manner of setting the trap. The mole run is

HOLLAND MOLE TRAP.

trodden down to close it, and across it is placed the forked stick, *B*, about a foot long, which is held down by a hooked wooden peg (*A*), driven into the earth at each end. About two inches from this stick and parallel to it another one is similarly placed. Between the two is the trigger, (*D*), a stick placed between the two forks; one end of this has a notch cut in it, and passes under the crotch of a hooked peg. At the end of a spring-pole, only part of which is shown in the engraving, is fastened a string, to which is attached the little catch, *C*; both ends of this catch are wedge-shaped, and one end is placed in the notch in the trigger, while the other catches in a corresponding notch cut in the hooked peg. It will be seen that if the trigger is slightly lifted the catch will be loosened and the spring-pole fly up. Two pieces of wire, each with a loop in the lower end, are attached to the pole. These loops, which should be the size of the run, are so buried that the mole will pass through them. The earth is scooped out between the arms of the forked sticks, the loop placed in and covered with earth. If the mole comes in either direction, it springs the trap, and is caught and held fast by the wire loop. The trap is much less complicated than may seem from the description, and can be made and set in less time than it takes to write out a description of it, and of how it works.

HOGS IN THE ORCHARD.—At the July meeting of the Alton (Ill.) Horticultural Society, it was strongly advocated to put hogs in the or-

chard. "Mr. Caughlin said he turned about 25 hogs into his peach-orchard last year, when the fruit was dropping; they ate up all that dropped. This year his peaches are very fair. Mr. Brown said he considered hogs a very great advantage in the orchard; has one orchard that he could not fence for hogs, and the fruit in it is much more affected with insects than in the others where the hogs run. His hogs do well, and give him cheap pork. He intends to keep hogs in all his orchards. He recommended seeding orchards to clover."

Seeding Down Lawns in Autumn.

The autumn is in some respects the most favorable season for finishing a lawn. Lawn making really should take two seasons, one summer for grading, the autumn and spring following for planting, the following summer for tillage; during which it may well be occupied by some properly summer crop which will leave the ground bare in August or early in September. If the manuring be liberal and the soil good, early sweet corn will be found a very profitable crop near a market; corn sowed for green fodder will pay well anywhere. Oats may be sowed late after tree-planting time, and cut for fodder. The ground should be occupied by some crop, rather than by weeds; but regard for this crop should not prevent any desirable spring planting being made, and if some summer grain be employed to cover the ground, the grass seed should not be sowed with it as is usually done, unless

ample time may have been allowed for the fillings to settle, and to be regraded, and the surface soil to become homogeneous in character through tillage and weathering. Perhaps the best practice on tolerably level and well-drained land is to keep it fallow during the second summer, plowing and harrowing it as often as a tinge of green shows itself, indicating a crop of weeds. The first of September, or at any rate a few days after, should see the land newly plowed, leveled off with a broad scraper, where dead furrows or undesirable depressions of any kind exist, and harrowed thoroughly. If two or three hundred weight of Peruvian guano be applied and harrowed in, the effect will be satisfactory. Such land is in fit condition to receive the grass seed, and although it is almost universal for farmers to seed down to grass with some small grain crop, it by no means follows that this is the best way.

Grass sowed on well prepared soil does best alone. The quantity of seed should be liberal, and, as a rule, only those kinds of seed should be mingled which harmonize well. The "mixed lawn-grass" seed which is imported from England and sold by most seedsmen on account of its attractive name, and the idea that the greater the mixture of varieties the closer will be the sod, is undesirable. Many of the kinds of grass will not flourish, and those which retain possession of the soil do so after a struggle to oust the others. White clover is natural to most of our soils, so that it is rarely possible to keep a lawn clear of it. Still, as the beauty of a close shorn

turf is impaired by spots of this plant, it is ordinarily best to use a pound or two of the seed to the acre. There are certain commonly cultivated grasses which are an abomination on a lawn; among them Timothy, Orchard grass, and Rye grass. Our closest pasture sods consist chiefly of June or Blue grass, Red-top, Sweet Vernal grass, and White clover. We recommend, then, for seeding a lawn a mixture of June or Blue grass, and Red-top, in equal parts, a bushel of each, White clover, as above stated, and a dash of Sweet Vernal grass, which, however, exists in abundance in most soils, throughout the Middle and Eastern States. This last is a pleasant addition, as it gives out a fragrance when drying, which is exceedingly grateful. On stiff soils which will be subjected to alternate freezing, thawing, and washing, it is well to sow a bushel of oats with the grass seed. Should the oats grow too rank, they can be cut, and they will, if not too thick, form an excellent protection to the young grass, and disappear in the spring. After sowing, roll the land evenly.

Cleaning up the Garden.

We have noticed in the onion districts, that the best cultivators are exceedingly careful in cleaning up the land, after the crop is matured. Not only are all the weeds gathered that have escaped the hoe in the cultivation of the crop, but the whole ground is raked over and not a weed left to mature its seeds. They find it pays, in the labor it saves next year. It is partly on this account that onions are cultivated for years in succession upon the same land. It takes several years to get the weed and grass seeds out of the soil, and to give the crop the full benefit of the land. If the garden could have this thorough cleaning up, as fast as the crops are out of the way, it would make vegetables much cheaper. The pens are often out of the way in July, and the weeds have the ground the rest of the season. The potatoes and early cabbage are gone in August, and the weeds reign till frost comes. If you must have a crop to induce tillage, put in turnips. These will always pay where there is a pig or cow upon the premises. But with or without cultivated crops, keep every corner of the garden clean.

Wilson's Blackberry and the Small Fruits.

Wilson's Early Blackberry has been exhibited this season in great abundance, and of great size. One fruit grower assures the public that he has made it produce from 300 to 900 bushels per acre. At this rate of production, it will pay much better to grow blackberries than raspberries, which are thought to yield largely at 200 bushels per acre. It would seem a fair inference from the statement of cultivators, that blackberries will yield much more fruit to the acre than raspberries, and the price, judging from the retail market, is not much less. The truth is, with the single exception of strawberries, we have no adequate supply of the small fruits. Even whortleberries, that used to be dear at six cents a quart, are now retailed at 25 cents, and currants, that might be grown so easily, are still dearer. Fuller's Small Fruit Culturist ought to be sent on a mission to all the suburbs of our cities. We want to suggest to our Agricultural and Horticultural Societies the distribution of this work in special premiums at the fall fairs. It will do a good work. Published by O. Judd & Co. Price, \$1.50.

A Beautiful Climber.—(*Akebia quinata*.)

Many years ago Mr. Wm. Fortune, the celebrated adventurer in China, found along the hedges of Chusan a climber which was transferred to the green-houses of England, and for a long time valued as a green-house plant. Indeed, the first we ever saw of it in this country was in a house. But like many other things, which, at their first introduction, were regarded as tender, this has proven, at least around New York, and southward, perfectly hardy, and instead of growing it as a pot plant, it is now made to cover large trellises out of doors. It runs very freely and makes a dense covering of foliage. The engraving shows the shape of the leaves, somewhat reduced in size. They bear a general resemblance to our Virginia creeper, but are smaller, and of a duller green. The flowers appear in clusters from the axils of the leaves in May. Each cluster contains both staminate and pistillate (male and female) flowers. The flowers are not particularly showy, being of a dark purplish color, but their exquisite spring-like fragrance compensates for any deficiency in color. The outer flowers of the cluster are staminate, and consist of three colored sepals, with six stamens, while the central ones are smaller, and have from three to nine pistils. The rapidity of growth, and the fragrance when in bloom, render this a most desirable climber, not only for covering screens, but for growing over supports. We have seen it grow upon a cedar stake, which it completely clothed and made a most beautiful object. The name *Akebia* is a Japanese one, and the specific name, *quinata*, refers to the five-parted leaves. Botanists place the plant in the small family called *Lardizabalaceae*, of which we have no native representatives; our nearest relative is the Moonseed (*Menispermum*). We believe that the plant is kept by most nurserymen. Here we just wish to say a word to our correspondents. We scarcely ever publish a figure of a plant but we get letters asking for seeds. We have neither seeds nor plants (except those named in our premium list) to send, and cannot take orders for them, even from old friends. It is seldom that we illustrate a plant that cannot be had of the regular nurserymen, if a shrub or perennial, or the seeds of which cannot be had of the seedsmen. The large dealers who advertise with us keep all these things, and it is impossible for us to fill orders. In the case of entirely new plants, (and we sometimes have to notice such), we are always careful to say that they are not yet in market. We often forego the illustration of really desirable plants because we know that they can not be readily obtained by our readers.

Some New Peas.

The reports of the trials of peas at the Royal Horticultural Society's gardens, at Chiswick, are always interesting, as they give impartial accounts of experiments made with different varieties grown side by side, and in sufficiently large quantities to make the results of practical value. The trials this year show, as have the previous ones, that many new varieties are only old ones renamed. As most of the sorts thus put down

are not known with us, we do not give their names. The custom of furnishing an old pea with a new title is not unknown in this country. An English seed dealer informed us that he sent the same variety to several different dealers, who put it out each as his own "Extra Early." The pea which seems to have the greatest number of synonyms is the Daniel O'Rourke. This is itself a misnomer, it being really Sangster's No. 1, though the other name has become so widely known that there is not much probab-

AKEBIA QUINATA.

ity of its being changed. Of this variety, several stocks are known, differing in quality, according to the care that has been used in cultivating and selecting. Among the new peas the one the most highly commended is Laxton's Supreme, resulting from a cross between Laxton's Prolific and Little Gem. This variety is as early as the Daniel O'Rourke, and of better quality. The Gardener's Chronicle says: "A grand pea: the sample sent was remarkably fine—large, full pods, with 10 large peas in each, and almost as uniform in character as if from a mold." Other fine varieties raised by Mr. Laxton are William the 1st, and Alpha.—Interest always attaches to new things, and we watch their development with pleasure, though for many years lovers of this delicious vegetable have had no occasion to place their main reliance for early on other than the Daniel O'Rourke, and for late on any but the Champion of England.

Packing Fruit for Market.

If the old shopkeeper's maxim that "Goods well bought are half sold" is true, it is still more true that fruit well packed is half sold.

Many are pomologists for the love of it, and never sell fruit; such do not consider the commercial side of the question of much importance. They discuss varieties, settle which are best for family use, and which for market, but when it comes to the question of how to market, they think it outside of their province. Of late years, however, a new set of pomologists has sprung up,—those who hold that they should do good and make money. Especially do we meet these at the West, where we encounter men who have as keen an eye and palate as the amateur, and who not only know which are the best fruits, but which will pay the best. It is through the influence of such men as these that pomological bodies are brought to discuss the best ways of turning fruit into money. The Western State Societies, always wide-awake, often discuss the subject of packing and marketing fruit, and last year it occupied the attention of the American Pomological Society. The question of the best package for fruits is yet an unsettled one, except for apples, which are almost uniformly shipped in barrels. So important a matter is it for large fruit growers to get the best possible package, that Mr. Knox, of Pittsburgh, has offered a premium for the most suitable for berries and grapes, to be awarded at his grape exhibition in October next. Boxes are taking the place of baskets for peaches, and are better for choice pears than are kegs and barrels. There is one point upon which there is great want of uniformity—the size. When fruit is quoted at so much a box or crate, it is interesting to both grower and consumer to know what quantities these represent. So long as neither law nor custom establish the size, it will vary; but it is not easy to see why one should buy his peaches at a venture, while the law looks after his bushel of wheat.

But whatever the package, the manner of placing the fruit in it has much to do with its opening handsomely. Barrels and boxes are packed bottom upwards. The bottom of the barrel or box is removed, a layer of fruit neatly put in, with the stems all in one direction, and the remaining space so filled that some pressure will be required to bring the head or bottom to its place. The mark is put upon the head or cover to be opened. In packing grapes in boxes, the same order is observed. In putting up fruit in this way, it is not necessary to practise "topping," or putting the best fruit where it will first meet the eye, but only to make the packages open handsomely, and their contents show at their best. Placing a small quantity of good fruit at the top after filling the box with that of an inferior quality is not only dishonest, but impolitic. As a St. Louis dealer said at the last meeting of the Am. Pomological Society: "I wish every shipper knew the value to him of a good reputation—of a reputation that will sell fruit-packages bearing his brand at the highest market price, without inspection. Every fruit-grower should aim to get such a reputation." We have already a great variety of bowls, boxes, and cups, with the crates to pack them in, and every year is adding to the number. They are of marvelous convenience and cheapness, and it will pay any fruit grower to visit this city to see what the inventors of the country are doing to help the sale of his products.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Sea-side Fare.—The Clam.

A New Englander who orders clams in New York is likely to be served with a quite different "shell-fish" from the one he had been accustomed to call the clam at home. That which is commonly called the clam in New York is the quahog of New England, while the clam proper is designated as the soft or long clam. The two are quite different in structure, habits, and flavor. The clam proper (*Mya arenaria* of the naturalist), is the one represented in figure 1. The shells are quite thin, and of a more or less distinct white, or often of a dull

Fig. 1.—SOFT-SHELL CLAM.

lead color; the color as well as the size varying with the locality. At one end of the shell projects the siphon or "snout," which is capable of remarkable extension. The clam burrows in the sand along the margins of salt water bays and rivers, between high and low water mark. It is concealed at a depth varying from a few inches to a foot or more below the surface of the sand, and keeps up a communication with the water above it by means of its long snout, through which it takes its food. Clams are obtained by digging with a short handled hoe, when the tide is low. Their presence is readily discovered by the jets of water they throw up when alarmed by footsteps. They discharge a sudden stream of water and draw their snout completely within their shells.—The engraving, figure 2, presents the animal with one shell removed. The large, roundish body is popularly known as the belly, the narrow strip which nearly encircles it is the "rim," while the snout has been already spoken of. The snout and rim are covered with a thin and usually dark colored skin, which is easily separated, and is

Fig. 2.—CLAM ON THE HALF SHELL.

removed in preparing the animal for food. Only the lower part of the snout is eatable, the upper portion being of a strength and elasticity to defy mastication. The tenderness and flavor of the clam vary in different waters, and in the same water there are beds the products of which are particularly prized. Clams are cooked in a variety of ways, the best of which is the aboriginal "clam-bake," an institution

which attains greater perfection on the shores of Narragansett Bay than elsewhere. In the summer season the shores of this Bay are visited by thousands of people, many of whom come from a long distance for the purpose of enjoying a clam-bake. The method of cooking is most primitive. A cove is paved with stones, upon which a fire is built. When the stones have become well heated the coals and ashes are swept off and the clams placed upon them in a heap and closely covered with a heavy coating of sea-weed. The clams are steamed in this way until they are done, which is indicated by the opening of the shells. They are served in the shell. Each guest is supplied with a cup of melted butter, to which pepper, vinegar, etc., may be added. The animal is picked from the shell, and the thin skin, before referred to, pulled off.

The snout furnishes a convenient handle for holding it while conveying it to the mouth, it first having had a dip in the melted butter. The snout is retained by the fingers while the tender portions are bitten off. A distant imitation of a clam-bake may be made by placing the clams in a closely covered pot over a fire until done. Fried clams are sometimes poorly done, by opening them, splitting open the snout, to remove the grit usually contained there, rolling in meal or crumbs, and frying whole. A much better way is to remove the bellies, cover with meal, and fry separately; the rims and the tender portions of the snouts are to be chopped fine, mixed with egg and flour to form a batter, and fried as fritters. Clams may be stewed after the manner of oysters, or made into a "chowder," which is a compound stew in which pork, potatoes, onions, etc., are used in varying proportions.

Tomatoes Next Winter.

This favorite vegetable is eaten with added relish during winter, when the garden is locked up, and "sauce" is hard to procure. A little painstaking now will secure a good supply for the time of need. Select ripe, sound tomatoes, place them in a colander, immerse them in boiling water to loosen the skins, lift them out, and peel them at once. Cook them in a porcelain lined kettle. Tin will answer if it be not much worn, but iron is easily corroded by their acid, and the fruit will be spoiled in color and flavor by its use. Stir with a wooden spoon or pudding stick. Tomatoes may be kept without very thorough cooking, but as they are largely composed of water the sauce will be much better if boiled down one-half or more of its original bulk. Put them up in tin cans if bottles cannot be procured, and solder the tops tight while the contents are boiling hot. This is a troublesome process, and fruit preserving jars or bottles, which are now easily had at almost every country store, will be preferred. With these, as with all vegetables or fruits to be kept air-tight, the one great point of care is to make them air-tight. Have the bottles heated that they may not crack, pour in the hot contents, filling the jar, and fasten the cover at once. By the use of fruit-preserving powders or solution, which prevent fermentation, less care is needed to exclude the air. Many who have used these preparations prefer them to the former method.

TOMATO CATSUP.—At the request of several inquirers we republish the directions given several years since in the *Agriculturist*. Select perfectly

ripe, sound fruit, cut in slices, and boil until the pulp is cooked soft. Rub it through a sieve to take out the skins and seeds, and replace it in the kettle for cooking. To each gallon of pulp add three tablespoonfuls each of salt, ground pepper, and mustard, and one of ground allspice. Enclose four large sweet peppers, and two or three garlics, or one large onion, in a small bag, and boil in the catsup. The garlic or onion may be omitted if the flavor is not relished. Cook it until of the right consistence. It should be just thick enough to run slowly from a bottle. When cool, pour it into bottles, cover them with a bit of cotton cloth tied on the neck, and leave it three months to ripen; then cork and seal.

Soap Cups.

Soap dishes of some kind are indispensable about the kitchen sink or wash room, if the housekeeper means to be neat and orderly. The illustration presents cheap forms of these articles. Fig. 1 is a berry bowl, such as is retailed in the market for four cents. It is turned in a lathe from poplar or

Fig. 1.

any soft wood, and makes a convenient dish for hard soap. Fig. 2 is made from two blocks of inch board, about $4\frac{1}{2}$ inches square, with a hole cut in the middle. Between the blocks a strip of copper or iron wire cloth is inserted, and the two blocks are pinned or screwed together so as to bring the grain at right angles. These dishes can be made at home, and have this advantage over stone dishes or earthen ones, that they are not easily broken. We give quite frequently these illustrations of ornamental and useful articles, for the purpose of encouraging their home manufacture. In many parts of the country, where labor and material

Fig. 2.

are plenty, they can be made cheaper than they can be purchased, and making them serves to develop the mechanical skill of the boys, and affords them interesting and profitable occupation. A little work-shop, with a turning lathe and a tool chest, we think one of the best investments a father can make for his sons. They will spoil some good timber, some screws and nails, and cut their fingers perhaps, but will soon learn to use tools efficiently, and will get an education in practical matters quite as valuable as anything they learn in schools.

The Cooking of Vegetables.

In continuing our notes on the manner of cooking some of the less known vegetables, we give some that are seldom found upon farmers' tables, though there is no reason why they should not be.

EGG PLANT.—The fruit of this is egg shaped when small, but as it grows large, it becomes irregularly rounded. It is fit for use from the time it is two or three inches in diameter, until the minute seeds begin to turn brown. It is singular that the fruit itself is called egg-plant; the name egg-fruit would be much more appropriate. In some places it is called Guinea Squash. It is one of those vegetables, which, like the tomato, most people do not relish at first, but of which after a few trials they become exceedingly fond. Even when most carefully cooked, it absorbs a great deal of fat, and is not suited to those whose digestion is feeble. The fruit is cut into slices about half an inch thick, pared, and the slices piled up on a plate with salt sprinkled between them, and allowed to lie for

an hour before cooking. Some omit the paring as well as the previous salting, but there is apt to be a slight acidity unless these are done. The slices are dipped in a thin batter, or in egg, and covered with powdered cracker, and fried until quite soft. Sometimes the batter, etc., are omitted, and the slices fried without any covering; in this way they soak fat and are very greasy. It is said that they are good stuffed with spiced bread crumbs, and baked, but we have never tried them in this way.

OKRA.—The pods of a plant related to the Holly-hock are eaten, especially at the South. They are from two to four inches long, several sided, and pointed at the tip. These should be taken before they become at all tough or fibrous, at which time they abound in a thick mucilage, which has no very positive flavor. Their chief use is in soups; the pods being sliced and added to the soup impart a richness and thickness. The "Gambo" of the South is a thick soup or stew made with chicken and Okra. The whole pods boiled plain and dressed with drawn butter are fancied by many, and are considered a very nutritious and wholesome dish.

SALSIFY.—A white root, shaped somewhat like a diminutive yamsip, often called Oyster-plant or Vegetable-oyster. In season from the time the roots are as large as one's finger until spring. May be kept in the ground or in the cellar. In whatever way the root is used it is first to be scraped to remove the skin, and immediately thrown into water. If allowed to remain exposed to the air after scraping, the milky juice the root contains would soon turn to a disagreeable brown color. One of the simplest ways of cooking is to cut the roots in small pieces, stew in water until tender, make a sauce by adding butter and a little flour to thicken, and season with salt and pepper. To fry Salsify, boil the roots whole until tender, dip each one in batter, and fry; or wash the boiled roots, and make small cakes, which are dipped in batter and fried. Oyster soup, which is considered by some to bear a resemblance to oyster soup, is made by boiling the sliced root in water; when tender, add milk, butter, pepper, salt, and thicken with a little pounded cracker. A little pickled codfish is added by some cooks to increase the resemblance to oysters, but for ourselves we like salsify too well as salsify to wish to make it appear like anything else.

Household Talks.

BY AUNT HATTIE.

One of the nicest desserts for dinner this warm weather, I think, is ice cream. If properly managed, it is as cheap if not cheaper than most of the rich pastries and puddings usually found on our side table, and if not made of rich custard and pure cream, is much healthier. I often make mine of new milk only, flavoring with white sugar and vanilla. Of course if I have company or wish it extra nice, I add a considerable quantity of fresh cream. The freezing process is extremely simple. If one has a patent freezer or uses merely a tin pail, the method is much the same. Let the cream or prepared milk or custard be put into the tin, and placed in a cool cellar where it may get as cold as possible before trying to freeze. When ready, adjust the cream tin in the center of the wooden pail. If a patent is used, be careful to fasten the little hooks found on the bottom of the tin into the latches on the bottom of the wooden pail. Break up into quite small pieces about 5 pounds of ice, and allow to that quantity a little over a pound of salt; put into the outside pail a layer of ice and a good sprinkling of salt, another quantity of ice and salt, until all is used. Let it stand a minute or two, and then commence to turn the handle for the purpose of stirring the cream and the freezing agents. Rapid freezing depends upon the ice and salt being brought constantly together. This can only be done by constant agitation. In the patents the agitator and cream-dasher work in unison. If the cream is long in coming to ice, put more salt in the outer pail. To an experienced operator, 5 pounds of ice and 1 of salt is quite sufficient to freeze 2 quarts of cream, and I have often placed more cream in the

tin after the first was used, and allowing it to remain, stirring occasionally, have had a pleasant surprise for callers in the afternoon and evening.

I think that I am justly proud of my ingenuity in inventing a drying frame. Its extreme simplicity puts it within the reach of every housekeeper. I got Edward to bring me from the carpenter a wooden frame, made light, but strong, and about 5 feet square. Also a small ball of white, but strong twine. I cut a quantity into lengths of 7 feet, and to one end of each fastened a tack, which was ham-

DRYING FRAME.

mered firmly on one side of the frame. About an inch and a half from this another string was secured in the same way, and exactly opposite to each tack a shingle-nail was driven firmly into the frame. When stringing apples or peaches for the purpose of drying I use a darning-needle, threading the loose end of the string, and when a sufficient quantity is threaded, take off the needle and wind the string around the shingle-nail opposite. As the fruit dries it may be slipped along the thread and more added until the frame is full of dried fruit. This is a very convenient frame as it may be taken in at night or during a rain storm without disturbing the fruit, and may also be adjusted over the kitchen stove and used for drying apples during the winter months.

A favorite dish for tea, I make as follows: Set to boil a quart of milk, beat the whites of three eggs to a foam, add a very little white sugar, and a little lemon; put this to float on the milk. As soon as the milk boils, take off the foam and stir in the whites of two, and the yolks of five eggs, well beaten, with sufficient sugar to sweeten pleasantly. Take from the fire immediately, and set to cool. When nearly or quite cold, season the custard with lemon or vanilla, and pour into custard cups, or into a glass dish, and place the foam on the surface. It is a very handsome dish and eats as good as it looks.

The doctor says he likes my ripe tomato pickle better than any other kind. It is certainly the most easily made of any. I boil up a quantity of vinegar, spicing well with red peppers, allspice, mace, mustard seed, whole ginger, and horseradish, to about a gallon of vinegar, adding about the size of a butternut, and a small quantity of salt; pour into a crock, and every morning as the tomatoes are gathered, select the smooth skinned, firm fleshed, and small sized ones, wipe and place gently in the vinegar, allowing a small plate over them to keep them under. The vinegar should be very strong and good. This pickle will keep all winter if stored in a cool cellar. Small cucumbers, small green tomatoes, radish pods, button onions, beans, and nasturtium buds, I gather from day to day, throwing them into a brine not too strong. In nine or ten days I drain from the brine, allowing them to stand in the colander four or five hours before pickling. After wiping dry and placing compactly in a crock or jar, I pour over a vinegar pickle made the same as for the ripe tomatoes, omitting the salt, however. On no account use cloves or cinnamon for green pickle, as it will discolor it sadly. Reserve those kinds of spices for peaches, plums, and all kinds of sweet pickle.

A Good Word for the Cabbage.

Cabbages, in cooking will leave an odor behind them, but ventilation is a ready remedy for this and other ills. The whole tribe is wholesome—Early York, Flat Dutch, Bergen, Green Savoy, Stone Mason, and Mammoth. Gregory of Marblehead ought to have a monument for growing them of 60 lbs. weight. For laboring people the cabbage is a great sustainer of muscle. For this reason

it is universally popular among our Irish and German fellow-citizens. By some it is thought to be indigestible, but this depends more upon the mode of cooking than upon the article. As cold stew it agrees with delicate stomachs, if they are in health. If not, vegetables and fruits of all kinds give trouble. Though an admirable accompaniment of a boiled dinner, it should not be boiled with the corned meats, and it should be thoroughly cooked. There is a difference, too, in the article. Green Savoy stands at the head of the list, and for those who cannot have cauliflower, is good enough.

Ladies at the Fall Fairs.

The best part of any agricultural exhibition is the people, and the best part of the people are the ladies. The legitimate aim of the fair is the instruction of the people in the details of their calling. We very properly measure the success of an agricultural exhibition, not by the multitudes that throng it, and the entrance fees, but by the instruction it affords to those who come. There should first be something to see, and then the more that come the better. No part of the exhibition is more instructive than that which appropriately comes under woman's supervision. The dairy belongs to her, and the bread, the needle-work and the fine arts, the flowers and the poultry. We are very far from perfection in any of these departments, and we should like to see the skill and enterprise of our fair countrywomen fully represented in the fairs that are just before us. The prizes are worth contending for, aside from those offered by the committees. "The best bread maker in the country" is an honor that would sit gracefully on any woman. The finest butter neatly stamped in golden balls is certain to be looked at, and the maker to be inquired for. Bonques tastefully arranged will draw something better than the premiums offered. They will draw out the skill, and cultivate the taste of the makers, and give pleasure to the thousands who study them. Of course it will take time and labor to prepare for the fair, but could the labor be more worthily bestowed? These fairs, notwithstanding their perversions, are doing a good work in the education of the people. We have followed them for a score of years, and never attended one but we carried away new ideas and useful hints. It does us all good to come in contact with our fellows, and study their handiwork. It is a duty we owe to society to contribute our share to these exhibitions and make them successful and worthy of general patronage.

SUNSHINE IN SLEEPING ROOMS.—Sunshine is as necessary to the health of animals as plants, and we should contrive, if possible, to have our sleeping rooms upon the east and south sides of the house. We want more sunlight of the material kind, as well as the spiritual, in our houses. "Faded carpets!" you exclaim. Then out with them, or let them fade. Better a thousand times than have the roses fade from the cheeks of wives and children.

Preserving Crab Apples.

A beautiful sight is the crab apple tree, loaded with its ruddy or golden fruit, which loses none of its charms when well preserved upon the table. Core them with a penknife, leaving the hole as small as possible. Put a pound of refined sugar for every pound of prepared fruit in the preserving vessel, and add one cup of water to each pound of fruit and cook over a slow fire. When the sugar is all dissolved, and hot, put in the apples and boil gently until they are clear. Take out the apples, boil the syrup until it is thick, and pour into the vessels in which the fruit is to be kept. A few slices of lemon boiled with the fruit improves the preserves for those who like that flavor. The apples are sometimes preserved whole with $\frac{3}{4}$ of a lb. of sugar to 1 lb. of fruit, but they are not so nice. For immediate use, a $\frac{1}{2}$ lb. of sugar to one of cored fruit makes a nice sauce for roast meats.

BOYS & GIRLS' COLUMNS.

"Sunstroke."

Lightning strikes, and with terrible energy tears, melts, and destroys whatever would obstruct its passage; but properly speaking, the sun does no such thing. No sudden beam darts with resistless force to smite the unfortunate person who may be exposed in the sunshine. What is called sunstroke is really prostration from excessive heat, and it may occur in any overheated apartment in the shade as well as in the sunshine. Persons enfeebled by drinking, by over exertion, or other causes which lessen the strength, are most liable to be thus affected. During the hot weather of July, this year, when more than two hundred persons died from this cause, in New York alone, in a single week, it was observed that a very large majority were of intemperate habits. Confirmed teetotallers were exempt. No temperance lecture could be stronger. Usually there are symptoms of prostration by heat, occurring in time to avoid a fatal result. Trembling, faintness, inability to move, and a sinking feeling, usually precede the more marked effects. When any such feelings are experienced during extreme heat, all exertion should be instantly stopped, and the person lie down in the shade at once until entirely relieved. Cold water or ice applied to the head, and some stimulant administered with judgment, will aid in recovery. Prevention is not difficult. All excess in food, drink, or exercise, and much excitement of any kind, should be especially avoided, when the mercury in the thermometer marks 90 degrees or upward. If work must be done, a cabbage leaf or wet handkerchief placed in the top of the hat will serve a good purpose.

Curious Gambling.

A traveler describes a singular mode of gambling witnessed by him in Peru. A negro having a large tray of pies takes his stand at some corner where many are passing. Those who wish to engage in the game, usually boys, each place a penny on some one of the pies, which are valued at five to ten cents each. The proprietor then with a small brush drives away the flies which swarm over the eatables, and all anxiously wait to see on which pie a fly will first alight. If it be on one where a penny is placed, it becomes the property of the person who laid down the penny, and the remainder of the money is taken by the owner of the pies. A similar style of gambling has been practised in Paris, by dissolute young men who place several lumps of sugar upon a table, and then bet as to the lump on which a fly will first alight.

Ways of Getting a Living—IV.

TRY YOUR STRENGTH, SIR?

The apparatus shown in the above engraving, called a dynamometer, is very popular in a crowd. Every man, and every boy especially, likes to be there, to know the power of his muscles, and if it be more than ordinary, to exhibit it. So the man who lets people try their strength at a penny apiece finds it quite profitable. The writer once discovered a trick of this trade while trying the machine with a number of friends. Being of about ordinary strength he could lift probably 400 lbs., but pulling at the dynamometer he was astonished to find he had lifted over 600 lbs., according to the mark on the dial plate. The proprietor complimented the surprising strength shown by a not very large man, but the latter smiled to notice how the apparatus was arranged to show more than the real strength laid out. If such trials of strength, carefully made, so as not to strain the person, would lead to the use of proper means of increasing one's muscular power, the exhibitor of the dynamometer might

be classed among the useful members of society. Dr. Winship, the strong man, who lifted 2,000 lbs. or more, showed how muscle can be increased by training. Such extraordinary lifting power is not needed, and costs more time and work than it is worth, but it proves that every healthy young person can improve his strength sufficiently if he will patiently labor for it by taking proper exercise.

A Private Picture Gallery.

Finer pictures than were ever painted on canvas may be owned by many without expending a cent. By training the eyes to observe, the imagination to arrange, and the memory to keep the scenes presented in every day life, or described by others in books and newspapers, one may furnish his inner apartments most gorgeously. Artists do this before they try to show their thoughts in pictures for the eyes of others, and every painter will tell you that the scene in his own mind is far more beautiful than anything he can express with pencil and brush. Perhaps there is a mountain not far from where you live. It looms grandly up toward the sky, and cannot fail to make a strong impression on the mind of one living near it. Now, it is not difficult with such a strong point to begin with, to work up a fine picture gallery. You can imagine all the varied changes of color which vines and flowers would give; new trees may be grouped here and there; a torrent rushing down the side, with a cataract midway, with the deep rugged gorge which it has worn away, will change the scene; you can build castles and palaces along its sides, and a towering fortress at the top, and set phantom soldiers, or real troops in armor, or with shining bayonets, climbing up the sides, and charging among the well defended works. If there is no such striking feature in the surrounding landscape, then make one. Read the best description you can find of forest, lake, or mountain, and bring it before you. There is no end to the variety of choice landscapes which may thus be possessed, and the making of them will not only fill many an otherwise unimproved hour with pleasure, but refine the taste, and purify and elevate the thoughts.

"Little by Little."

A nut dropped by a squirrel fell through the opening in the middle of an old millstone which lay upon the ground, and being thus protected, grew into a thriving sapling that shot up through the opening. In a few years it had increased so that it filled the space and was firmly wedged to the sides of the heavy stone. Still it grew, and in a few years more, little by little it lifted the entire weight clear from the earth, so high that a man could sit beneath it. All was done by atom after atom, borne by the sap to the growing trunk. Think of this, my little man, puzzling over "Long Division" in arithmetic; little by little of thinking and working will take you through Fractions, Rule of Three, and those terrible problems at the end of the book, by and by—but be sure that the little by little is not neglected. And you, hard working lad on the farm, or in the shops, look at Franklin, Watts, Morse, Field, Lincoln, Grant, and thousands more who have lifted the weight of circumstances that would hold them down like millstones, and who have by their steady perseverance risen above their fellows, easily bearing their burdens; and "Keep pegging away."

A Great Structure.

An exchange gives the following particulars concerning the dome of the Capitol at Washington. It is an hundred and eight feet higher than the Washington Monument at Baltimore, sixty-eight feet higher than that of Bunker Hill, and twenty-three feet higher than the Trinity Church spire of New York. It is the only considerable dome of iron in the world. It is a vast hollow sphere of iron, weighing 8,300,000 pounds. How much is that? More than four thousand tons, or about the weight of seventy thousand full grown people; or about equal to a thousand laden coal cars, which, holding four tons apiece, would reach two miles and a half. Directly over your head is a figure in bronze, "America," weighing 14,965 pounds. The pressure of the iron dome upon its piers and pillars is 13,477 pounds to the square foot. St. Peter's presses nearly 20,000 pounds more to the square foot, and St. Genevieve, at Paris, 66,000 pounds more. It would require, to crush the supports of our dome, a pressure of 75,380 lbs. to the square foot. The dome cost about \$1,000,000.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the August number, page 381. No. 314. *Logograph*.—The principal word is *peat*. From the letters may be formed, 1, Pat; 2, Pea (one syllable of peacock); 3, Pet; 4, Pate; 5, Tape; 6, Tap. No. 315. *Mathematical Problem*.—4,338 feet, nearly. No. 316. *Picture Puzzle*.—It is a holy sec (holy C.) in the midst of faces (of O's). No. 317. *Metagram*.—Meat, peat, feat, seat. No. 318. *Puzzle Pic-*

ture.—Death and Time are a pair of dividers. No. 319. *Puzzle Picture*.—A bee laboring (belaboring). No. 320. *Jal grand, a petit*, (J, large, a, small), read together, 'Ial grand appetit; meaning I have a great appetite.—As this part of the paper is sent to press very early in the month preceding publication, it usually occurs that the names of those answering puzzles are not published until two months after the appearance of the puzzles. The following have sent in correct answers to problems, etc., previously published. Jas. E. Masters, A. N. Daniels, Charles P. Anderson, Alice May Carrington, Eva Gray, J. Milton Snyder, Columbus Snyder, Mina M. Walker, Rufus M. Farrand, James A. Johnson, A. D. Wexler, R. Hall, M. Gathway, Frank T. Wray, Isabell Lucy Stewart, Sarah Dowland, Martha Richardson, Samuel M. Edwards, Edgar Tupper, Frank E. Cabot, G. Wood.

No. 321. *Puzzle Picture*.—How does this remind you of a sound on the sea shore mentioned by poets?No. 322. *Puzzle Picture*.—This man, in climbing after his goose, is in danger of falling. How may he get down safely?No. 323. *Illustrated Rebus*.—Very good advice to travelers.

No. 324. *Metagram*.—A word of five letters causes the notion of the heavenly bodies. Change the first letter and it becomes a pleasant retreat; a fortress; a dressmaker; a waterman; a haymaker; what frightened men often do; and a gift to a woman. What is the word?

No. 325. *Word Puzzle*.—In my first my second sat, my third and fourth I ate. What is this curious word?

[COPYRIGHT SECURED.]

THE ORPHANS.—FROM A PAINTING BY C. H. POYNDESTRE.—Engraved for the American Agriculturist

The kids have had their morning frolic, chasing each other round and round the hill, skipping from rock to rock, rearing and bounding, jumping with all-fours off the ground and giving an extra kick when in the air by way of flourish, and capering as only kids can.—By the way, our English word *capra* comes from the Latin, *capra*, which means a goat.—These little fellows having finished their play and taken a nibble at the grass and weeds, are now dozing in the sunshine, and enjoying such rest, as only exercise, innocence, contentment, and peace, can give.

The kid makes a very amusing pet, and can be trained almost as easily as a dog. Being docile and very strong and active, he may be broken to harness and made to draw a little wagon nicely. We have frequently seen a double team of young goats before a small cart, with a boy for driver, going at a merry rate, and obeying the bit like well-broken horses. They are very mischievous; no tree or plant is safe where they are kept. They seem very fond of nibbling the bark from the trunks of young trees. Here in the city they are often seen tearing down the show-bills posted on fences, and munching them like hay or straw. The feet of the goat are curiously formed, to fit it to climb among the rocks where it lives in a wild state. They are bordered with a sharp edge of horn, which keeps them from slipping easily, and they bound fearlessly over crags inaccessible to most other animals.

A Snake Story.

A foreign paper relates that a large case containing two huge serpents was deposited in a warehouse in Algeria, for shipment to the Zoological Gardens in Marseilles, France. While there, a cat found her way into the case, and was instantly enveloped in the coils of the reptiles, whose appetites were sharp from long abstinence. She was soon crushed to death, and both snakes commenced the process of swallowing her, one beginning at the head, the other at the tail. The teeth of such creatures are so placed, hooking backward, that they cannot let go when once they have commenced to swallow, and so the two serpents soon were brought face to face, and quite a struggle ensued. Finally, the larger of the two made a desperate attempt to swallow the other, was choked in the endeavor, and both died. The whole three unfortunate

are on exhibition, preserved in alcohol. The directors of the Zoological Garden intend to bring a suit against the parties who were to forward the serpents, for having allowed the cat to enter the cage, and the owner of the cat, it is said, claims her skin, to keep as a curiosity.

"Rich as Cæsus."

Who was Cæsus? How rich was he? He was the last king of Lydia, in Asia Minor. He reigned 560 years before Christ. He was successful in wars with surrounding countries, and captured immense treasures. The river Pactolus which flowed through his lands yielded abundance of gold dust from the sands of its bed, and he accumulated vast wealth. His riches are reported to have been seven or eight millions of dollars. At that period of the world's history, money would buy many times more than now, so that we may estimate him to have been worth a great many millions of dollars according to present standards. A number of men living in the United States are reputed to be worth more than Cæsus. He did not find money a sure support, although for a time it surrounded him with all his extravagant desires craved. While enjoying luxurious abundance, he thought himself the happiest man living; and he was quite offended when Solon, one of the wise men of Greece, told him that no man should consider himself happy until his death. Not long after this, Cæsus lost his favorite son, Atys, who was killed while hunting, and only a son who was dumb was left. Misfortune followed him. Having engaged in war with Cyrus, the Persian monarch, he was defeated, his kingdom taken from him, and himself condemned to be burned. As the sentence was about to be executed, he exclaimed, "Oh, Solon!" Cyrus inquired the reason of this, and Cæsus related what Solon had previously told him; whereupon his life was spared.

"The Old Oakon Bucket."

A fine picture representing the scene of this beautiful and familiar poem, which is now on exhibition, recalls the circumstances under which the lines were written. The author, Samuel B. Woodworth, was a printer in this city. Near the office where he worked was a drinker's house to which he often resorted in company with his

friends. One afternoon, Woodworth, after taking a drink of brandy, declared it was superior to anything he had ever tasted. "No," said one of his friends, "you are mistaken; there was one which we used to think was far better than this." "What was it?" asked Woodworth. "The pure, fresh spring water, that we used to drink from the old bucket that hung in the well, on our return from hard work in the fields on a hot day," was the reply. Woodworth sat for a moment much affected. "True, true," said he, and shortly after left the place. He immediately returned to the office, and under the inspiration of the recollections of his happy childhood, wrote the lines that have become familiar as household words.

Quite a Difference.—A little conversation between two boys, overheard at Central Park by one of our editors, is worth repeating. They were in the building where the animals are kept. "Come, let's go on and out into the Park," said the first boy. "Oh, you go on if you want to," was the reply; "you only want to look at the animals, I want to see them." Twenty years from now, which of these boys will be likely to know the most?

The Invention of Envelopes.

It is related in the Stationer, that these conveniences were first introduced as follows: About forty years ago there lived at Brighton, in England, a bookseller and stationer of the name of S. K. Brewer, and he used to place in his shop window piles of paper, beginning at the largest up to the then smallest size, 16 mo.; but to finish off the pile he cut cards, so as to bring them up to a point. Ladies used to go in and ask for that "dear little paper," which induced him to cut paper in small sizes. Then came the difficulty of the place for address; and the result was he invented the envelope, and had metal plates made for cutting them to shapes and sizes. This just pleased the ladies, and orders came to him for the little paper and envelopes from all parts. This at length became such a demand upon his time that he got Dobbs & Co., of London, to make them for him. Such was the beginning of the envelope trade, now extending over the world, and in which millions of dollars are invested.

(Advertisements on this Page \$2.50 per Line of Space).

DOTY'S WASHING MACHINE, lately much improved—and the new **UNIVERSAL CLOTHES WRINGER,**

improved with *Rhodes's Patent Double Cop-rollers*, and the *Patent Slop*, are now unquestionably far superior to any apparatus for washing clothes ever invented, and will save their cost *twice a year*, by saving labor and clothes.

Those who have used them give testimony as follows:
 "We like our machine much; could not be persuaded to do without it, and with the aid of Doty, we feel that we are masters of the position."—*Rev. Bishop Scott, M. E. Church.*
 "It is worth one dollar a week to any family."—*N. Y. Tribune.*
 "In the Laundry of my house there is a perpetual thanksgiving on Mondays for the invention of your excellent wringer."—*Rev. Theodore L. Cuyler.*
 "Every week has given it a stronger hold upon the affections of the inmates of the laundry."—*N. Y. Observer.*
 "I heartily commend it to economists of time, money and contentment."—*Rev. Dr. Deloria.*
 "They save three-fourths of the labor and time, and pay for themselves, both in money and contentment."—*New Orleans Picayune.*
 "Our help have always been willing to use it, and always have liked it."—*Orange Judd.*

PRICES.

Send the retail price, Washer, \$14, extra Wringer, \$3, and we will forward either or both machines, free of freight, to places where no one is selling; and so sure are we they will be liked, that we agree to refund the money if any one wishes to return the machines free of freight, after a month's trial according to directions.
 Canvassers with exclusive right of sale make money fast selling them.
 Sold by dealers generally, to whom liberal discounts are made.

AGENTS WANTED.

AUTOBIOGRAPHY OF **HORACE GREELEY.**

The undersigned have now ready, and are issuing, BY SUBSCRIPTION,

HORACE GREELEY'S **"Recollections of a Busy Life,"**

In a handsome octavo volume, of over 600 pages, well printed, on fine paper, illustrated with an admirable steel portrait of Mr. GREELEY, and with pictures of his various homes, in early and later life, as well as a beautiful portrait of MARGARET FULLER, engraved by LINTON. Originally published in the *New York Leader*, these interesting papers have been revised, and in part rewritten, by the author, with much additional matter, concerning Politics, Reconstruction, Jefferson Davis, &c., which make it one of the richest and most readable books of the day.
 Mr. GREELEY has said of it: "I shall never write any thing else into which I shall put so much of myself, my experiences, notions, convictions, and modes of thought, as these *Recollections*. I give, with small reserve, my mental history."
 Price, in ex. cloth, \$3.50; in sheep, \$4.50; in half morocco, \$5.00.
 APPLICATIONS FOR AGENCIES RECEIVED.
 EXCLUSIVE TERRITORY GIVEN.

Also,

THE GREATEST HORSE BOOK **EVER PUBLISHED.** **HIRAM WOODRUFF**

ON
THE TROTTING HORSE OF AMERICA,
 How to Train and Drive Him,
 With Reminiscences of the Trotting Turf.

Results of the author's forty years' experience, and unequalled skill in Training and Driving, together with a store of interesting matter, concerning celebrated horses of the American Turf. Embracing also an Introductory Notice of the late Hiram Woodruff, and a graphic sketch by the Editor of the Work, Charles J. Foster, of "Wilkes spirit of the Turf."
 The book is a handsome volume, illustrated with a splendid steel plate portrait of Hiram Woodruff.
 Price, ex. cloth, \$2.50; sent by Mail on receipt of Price.
 Early Orders from the Trade solicited.
 Canvassers wanted in every County and State: LIBERAL DISCOUNTS granted.
 Circulars of either of the above sent on application.

Value of Cresylic Compounds.

Reliable Testimony.
 Belton, Bell Co., Texas, July 10th, 1868.

Messrs. JAMES DUCHAN & Co.:
 The compounds of the Cresylic Acid sent me some months since, have been thoroughly tested by myself and neighboring rock-masters. All agree with myself, that as a disinfectant, and remedy to cure scab, lick scrow worm, and prevent its return, healing old gangrenous sores and wounds, killing and driving away lice, these preparations are without a parallel, and should be widely used of every stock-raiser in Texas.
 I have witnessed the use of the same preparation upon the human system, for wounds, bruises, &c., and in every case with the most satisfactory result.

Respectfully yours,
 H. J. CHAMBERLAIN,
 President of Texas Wool-growers Association.
 These Compounds manufactured with license under letters patent solely by JAMES DUCHAN & Co., 150 Elizabeth-st., New York. Send for Descriptive Pamphlet.

SEND NOW

for my new price list of plants, Blackberries and other small fruits, at uncommonly low prices.

DARWIN'S NEW WORK.

THE VARIATION
OF
ANIMALS AND PLANTS

UNDER DOMESTICATION.

BY

CHARLES DARWIN, M.A., F.R.S., &c.

WITH A PREFACE

TO THE

AMERICAN EDITION

BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY.

IN TWO VOLUMES.

This work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, results of in-and-in breeding, crossing, etc.

It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PHOENIX; FOWLS, DUCKS, GESE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, RUB VARIATION. INHERITANCE, REVERSION OR ATAVISM, CROSSING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTER-BREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.

Published in two Volumes of nearly
1100 pages.

FINELY ILLUSTRATED.

SENT POST-PAID.....PRICE \$6.00.

ORANGE JUDD & CO.,

245 Broadway, New York City.

A few of the notices by the Press, of Darwin's Great Work, *The Variation of Animals and Plants under Domestication*, are here given:

Mr. Darwin is not an ordinary writer, and has not been content to expand his earlier and more general statements. His recital of curious facts is enlivened and illustrated throughout by thought; his principles and arguments everywhere rest solidly upon observed fact.

The reader is frequently led up in thought, within sight and hearing, as it were, of the very workshop of Nature. Glimpses are given of wonderful prospects, passing suggestions of thoughts almost too bold for expression, or profound analogies are embodied in illustrations which might be expanded into theories.

Every chapter is full of facts. They are the substance of the whole work. No room is lost by the theories. They serve as a system for arranging the facts, of which the book seems to contain more than could possibly be compressed into the same space, if it contained nothing else.

Messrs. Judd & Co. have done justice to the work, and credit to themselves, by the elegance and accuracy of this reprint. It is as pleasant to read as the English edition, and more convenient to handle than that, which costs twice as much. [New York Evening Post.

While eminently valuable as contributions to science, these volumes will be found a source of much interest and instruction to the mere lover of nature. For example, in the case of the domestic pigeon, Mr. Darwin has described fully all the chief races, their history, the amount and nature of their differences, and the probable steps by which they have been formed. We have also the fullest discussion and information regarding domestic dogs and cats, horses and asses, pigs, cattle, sheep and goats. [Scottish American Journal.

Messrs. Orange Judd & Co. have laid the public under obligation by their prompt and handsome reprint of Darwin's last work. Whether the reader agrees or not with the peculiar views of the author upon the great problems involved, there can be no two opinions of the value of these volumes as a storehouse of the results of observations concerning our domestic animals and plants, far more elaborate and complete than can elsewhere be found. We can testify also that the work is a fascinating one for perusal. [Congregationalist & Recorder, (Boston).

The publishers have done a great service to science in reproducing this most recent work of Darwin's in a handsome and, for so elaborate a work, a cheap form.

He (Darwin) goes where his facts lead him, and of these he has an immense, but intelligently arranged number; and has thus given to the breeder of animals, or the propagator of new varieties in the vegetable world, a treatise of great practical value, explaining all the laws of variation and selection that have thus far been definitely fixed. [Newark Advertiser.

It is a work which will command universal attention, and will be of particular value to agriculturists, whether engaged in stock-raising only, or in the cultivation of the soil in general. [Forney's (Phila.) Weekly Press.

The book presents the most remarkable collection of facts, methodically arranged, concerning our domestic animals and plants, yet brought together, and for this alone, it is of the highest value. [St. Louis Journal of Agriculture.

Whatever may be thought of Prof. Darwin's peculiar theories, there can be no doubt that his works form a large and important addition to human knowledge. In the present volumes his theory is connected with a vast variety of interesting and important facts, which have great practical value apart from the hypothesis they are brought forward to sustain. [Boston Transcript.

The work is alike adapted to the wants of the practical agriculturist, and the student of natural history. The immense collection of facts which it presents in illustration of the scientific views of the writer, are of singular interest and value, irrespective of the peculiar theory of which he is the most able and earnest advocate, and in its present form, the original expounder.

Mr. Darwin's modesty is no less remarkable than his candor. He is an example of the humility which belongs to genuine science, and is the condition of high intellectual attainments. The execution of his work is in harmony with the characteristics of his mind. Written in a style of eminent simplicity, artlessness, and sincerity, free from abstruse reasonings or pedantic refinements, it must prove singularly attractive to the lovers of nature no less than to the scientific student. [New York Tribune.

NEW AND BEAUTIFUL WORK.

THE BOOK OF EVERGREENS.

BY

JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation,
Description of Varieties and their
Adaptability to Different Situations.

NOTICES BY THE PRESS:

A very complete and every way admirable treatise on the Conifers, or cone-bearing plants, is *The Book of Evergreens*. Mr. Hoopes has devoted many years of labor and attention to the beautiful class of trees treated of, and his work, which is copiously illustrated, must at once become an authority. We shall be glad also, if it induces any to a closer study of trees, and to a further ornamentation of their houses with them.

[Springfield Republican.

The value of this volume consists in its being both a labor of love and of duty. The author, having devoted a life to the study of trees and plants as a practical horticulturist, records here his views and experiences. Mr. Hoopes has studied all the treatises which bear on his subject, and availed himself of the assistance of many scientific friends, as well as recorded his own experience. The illustrations are numerous and excellent, and altogether the work has all the characteristics of an authority on the subject it so minutely and comprehensively treats. [Boston Transcript.

It is a practical treatise on the Conifers, or cone-bearing plants, describing them in all their families, and their best culture, management, and so forth, and is well illustrated. It fills a vacant niche, and every intelligent cultivator of trees should have and use it.

[Congregationalist & Recorder, (Boston).

The work was evidently prepared with great care and pains, and embodies the results of years of close observation and study. It is one of great value to the agriculturist and landscape gardener, and of special interest to all who care to know anything of the flora of the globe. To those who wish to raise trees, it is an indispensable hand-book. [Liberal Christian.

It is undoubtedly the most complete American work of the kind in print. It is well illustrated and handsomely printed. [Boston Journal.

We have examined this handsome book with a great deal of pleasure and satisfaction. The author has pursued a very desirable plan in his work, giving sufficient scientific information to meet the wants of the botanical student, and yet the work is sufficiently elementary in explaining terms and points about plant structure, and systems of classification,—in short, plain enough to meet the wants of every reader. It is printed in neat style, with thick covers and beveled edges, and a large number of very superior illustrations. [Journal of Agriculture.

The work is now ready. 435 pp., 12mo, on fine paper.

SENT POST-PAID, PRICE \$3.00.

THE GREAT PURIFIER.

AND

CRESYLIC SOAP

Saponaceous Compounds.

Disinfectant, Insect Destroyer, Pre-
ventive of Fungus, etc.

Frequent mention has been made in the columns of the *American Agriculturist* of Cresylic Compounds, as being valuable for destroying insects on animals and plants, and for other purposes. For some months past we have been investigating the merits of these preparations, with the following results.

Cresylic Acid is extracted from gas-tar, to which it gives the peculiar odor perceived on burning the tar. It has been used to a limited extent by chemists and physicians, for various purposes, and their experiments have shown it to possess remarkable properties as a disinfectant, and in destroying insect life and fungus growth. In its ordinary form it could not be readily applied, and hence was not available for common use. About two years since, Messrs. JAMES BUCHAN & CO., of New York, well-known as extensive manufacturers of family soaps, conceived the idea of combining this acid in saponaceous compounds. By long and careful experimenting, they succeeded in producing soaps in various forms, possessing the active properties of this acid, and thus bringing it within the reach of all classes. These compounds have been patented.

We have watched with great interest the results of various applications of these compounds, knowing that if successful, they would be of incalculable benefit to the community. By tests made under our own supervision, and the reports of careful observers, we believe it to be established that these Cresylic Compounds are

1st. Complete Disinfectants.—They not only remove all noxious odors from sinks, privies, stables, etc., but will destroy all infection in clothing, rooms, etc., washed with their solution. Thus, contagion from Small Pox, Typhus Fever, Cholera, and other diseases, may be definitely prevented. They are used in the New York and other Hospitals for these purposes.

2d. Insect Destroyers.—An animal washed with Cresylic Soap will be entirely freed from all vermin. It will destroy ticks on sheep, fleas on dogs, lice on cattle or poultry, roaches, ants, bedbugs, etc., in rooms. It repels flies from animals, and thus is especially useful in case of wounds or sores from any cause.

So far as tried, it has been efficacious in repelling insects from plants. We desire to have it more thoroughly tested for this purpose, and reports to be made. We believe it will free plants from Aphides, bark lice, slugs, bugs, caterpillars, striped bark, curculio, and the whole host of minute but powerful enemies in the garden and fruit yard.

3d. Preventive of Fungus Growth.—On this point we ask for further experiment. We feel confident this soap, properly applied, will prevent smut in wheat, mildew on vines, and similar parasite growth, and trust that experimenters will furnish the result of their trials.

4th. Cleaning Sores, etc.—For washing ulcers and other foul sores, and preventing gangrene in wounds, etc., Cresylic Soap is, we believe, unequalled. We know also that it has been successful wherever used, for foot rot in sheep, and mange, itch, ring-worm, and other skin diseases.

From numerous RECOMMENDATIONS of
Cresylic Compounds, the following are
selected as being specially valuable.

FIVE POINTS HOUSE OF INDUSTRY, 153 West St.,
New York, Nov. 15, 1867.

MESSRS. BUCHAN & CO.—Gentlemen—Some months since we purchased a large building which had been used as a tenement establishment for thirteen years, and was occupied by some ninety families. We tore away partitions, turning between three and four hundred rooms into less than one hundred. We found the walls and floors perfectly infected with vermin. We used freely in cleansing the CRESYLIC SOAPS, manufactured by your firm, and with the very best results, as the bugs, etc., have entirely disappeared. We propose to continue its use in cleaning our dormitories, hoping then to keep clear of a plague so common to all house-keepers in cities.

S. E. HALLIDAY, Supt.

BROOKLYN, November, 1867.

M. C. EDEY, Agent for Sale of JAMES BUCHAN & CO'S, Cresylic Soaps, etc.—Dear Sirs—We have had the Cresylic Soap used in the Ryndall Street Jail and County Court House, and in washing and cleansing prisoners' clothing, cells, etc.; and we are so much pleased with its cleansing,

disinfecting and insect-destroying effects, that we not only continue its use in above places, but recommend that it should be generally used for those purposes.

JOHN L. RYDER, } Committee on Jails
STEPHEN CLARK, } of Supervisors of
D. S. VOUGHS, } Kings County, N.Y.

COPUS CHRISTI, Texas, March 15, 1868.

MESSRS. JAMES BUCHAN & CO.—Gentlemen: Your Sheep Dip is wonderful in its effects. I have dipped 3,170 head with nine months' fleeces on their backs. It is now three weeks since, and no scratching as yet. Your Dip is far superior to tobacco, not so disagreeable or unpleasant, much less trouble and more permanent.

I have used it on horses when diseased with a species of mange or itch, and it has the same good effect as on sheep.

F. W. SHELFEFFEL.

On the use of disinfectants, the following is the testimony of Dr. ELISA HARRIS, Registrar of the Metropolitan Board of Health, New York City:

"THE DISINFECTING AND ANTISEPTIC POWER OF GOOD CARBOLIC ACID IS SO GREAT THAT ONE PART OF IT TO FIFTY OR ONE HUNDRED PARTS IS SUFFICIENT FOR ORDINARY PURPOSES."

* CRESYLIC ACID is the active property of Carbolic Acid.

Desiring that our readers should be benefited by the extended introduction of what we believe to be so valuable, we have established a general agency for the sale of these compounds, at our branch office, No. 41 Park Row, and are prepared to fill orders at wholesale or retail, at the following prices.

Sheep Dip, for Curing Scab and Destroying Insects on Sheep.

5 lb. Canisters.....	\$1.25
10 " " " " " " " " " "	2.25
50 " " " " " " " " "	10.00
200 " " " " " " " " "	35.00

Proportions are 1 lb Dip to 5 gallons water for 5 to 10 Sheep, if they are very large and heavily fleeced. For ordinary sized animals, or those recently shorn, 1 lb will take 8 to 10 gallons water. This solution must be graded according to the age and strength of the animal.

Plant Protector.—In solution for destroying and repelling insects from Trees or Plants.

In 1 lb. Canisters, @ 50 cts.; in 3 lb. Canisters, @ \$1.00; larger packages same price as Sheep Dip. See above.

Cresylic Ointment, for Cure of Foot Rot, &c. In solution for killing insects, &c., on stock. In 3 lb. Canisters, \$1.

Carbolic Disinfecting Soap.—In tablets for convenient use in washing Horses, Dogs, Pigs, &c., destroying insects of all kinds, protecting from flies, curative of Sores, Scratches, and Chafes of all kinds. In boxes, 3 dozen tablets, \$5.00; in boxes of 12 boxes, 10 each, \$1.00.

Cresylic No. 1 Soap.—In Bars. For all common uses in the Home and Laundry; 21 lb boxes, 15 cts. per lb; 60 lb boxes, 12 1/2 cts. per lb.

Cresylic Laundry Soap.—A finer Soap, for the Laundry, and for the Bath, etc., 60 lb boxes, 11 cts. per lb. 21 lb boxes, and in 10 paper boxes containing 6 lbs. each, packed in a case, 15 cts. per lb. Address orders to

COPELAND'S COUNTRY LIFE.

A COMPENDIUM OF

AGRICULTURAL & HORTICULTURAL
Practical Knowledge.

By ROBERT MORRIS COPELAND.

It contains 926 large Octavo Pages and 250 Engravings, and embraces Descriptions, Hints, Suggestions and Details of great value to those interested in Country Life. The following are some of the matters of which it treats:

DRAINING.
CATTLE.
SHEEP.
SHRUBS.
FRUITS.
FLOWERS.
VEGETABLES.
HOT-HOUSE PLANTS.
GRAPE CULTURE.
ORNAMENTAL TREES.

The Kitchen Garden receives particular attention. In short, as its name indicates, the book treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.

NEW BOOK OF FLOWERS.

By JOSEPH BRECK.

We have no work which is so safe a guide to the novice in gardening, or that imparts the necessary information in a style so free from technicalities. The following are some of the subjects treated:

Utility of Flowers.
Vitality of Seeds.
Planting.
Bedding.
Protection.
Bouquets.
Training.
Flower Gardens.
Lawns.
Flowering Shrubs.

SENT POST-PAID, - - - - PRICE, \$1.75.

Photographed from a cluster of the

Fruit, showing just

Mammoth Cluster Raspberry.

Warranted to stand the most severe winters in the most exposed situations. We most emphatically pronounce this superior in size and productiveness to any black Raspberry ever yet introduced. We speak from nearly twenty years of practical experience in small fruit culture.

Chas. Downing saw it on our grounds in any black cap I have ever seen, and coming in, as it does after the other black caps are done, it is a valuable addition to that class of raspberries. Andrew S. Fuller says: "It is the largest black raspberry I have ever seen, and I have some twenty-five varieties on my grounds." D. D. T. Moore says:

"The largest and most productive black raspberry we have ever seen, and of superior flavor." Wilcox of the Rural New-Yorker says on our grounds: "I never saw anything equal to it in the raspberry line." The Rural New-Yorker, of Aug. 8, says: "The canes are of a stouter and more erect growth, than those of the Doolittle or Miami, and the color of the foliage a shade darker. The fruit stalks are long, and the fruit is chiefly borne on the ends in insignificant, heavy clusters. The berry is larger, and therefore juicier and more acceptable to the taste, than the Doolittle. These qualities and its prolific habit, and late period of ripening, render it a valuable acquisition." The "Palmyra Courier" says: "It could not have been more appropriately named, for the fruit was of monstrous size, and hung in large clusters all over the bush. We certainly never saw such a mass of fruit on bushes before. The bushes bore a row of two or three year-old trees in the same field." Anderson & Co., Commission Merchants, 38 Washington St., N. Y., writes: "The 'Mammoth Cluster' you have conveyed to us, is the largest and best flavored—in fact, the most perfect raspberry we have ever seen. So far as variety raises the vicinity of New York, we think it will take the lead as a market berry." For our showing full list of fruit, description, testimonials, etc., send for our *Circular of new sorts*. Price of plants, \$3 per doz.; \$15 per 100.

Golden Cap.—We claim to have the largest, most productive and profitable yellow raspberry group. All of the visitors to our grounds, and the present season pronounce it superior to any "Golden Cap" they ever saw. \$1 per doz.; \$5 per 100.

Seneca Black Cap.—Entirely distinct. Flavor unsurpassed. Is rich, slightly tart makes it very fine for tarts, puddings, canning, etc. Extremely late, and fully as prolific and large as the Doolittle, 20 cents; \$2 per doz.; \$10 per 100.

Davison's Thornless.—Has proved it with us all that has been claimed for it. The earliest of all. 20 cents; \$2 per doz.; \$10 per 100.

Ohio Everbearing and Catawba.—Both very desirable on account of yielding a fine crop of fruit in the fall—at a time when no other small fruits are to be had. \$3 per doz.; \$10 per 100.

Lum's Fall Bearing.—Highly recommended by Dr. Warder, and other reliable horticulturists, and pomologists. Yields a certain crop of fruit, all the year round. \$3 per doz.; \$15 per 100. **Philadelphia.**—20 cents each, \$2 per doz. **Clarke.**—20 cents each, \$2 per doz. **Elisalde.**—Superior to Purple Cap, and a fine fruit of it. \$20 cents each, \$3 per doz. **Francenia, Brinkle's Orange, Kirtland, Purple Cana, Doolittle, and Miami,** \$1 per doz.; \$4 per 100.

STRAWBERRIES.

Colfax.—First introduced into South Bend, Ind., by the Hon. Seymour Colfax. We offer it as a reliable family and near market berry, and *entirely* distinct from any other equal for productiveness, or for size, hardness, and strength of plant. Berry, medium to large, perfectly symmetrical; color, dark crimson, with a peculiar spicy, subacid flavor. Season, medium to very late. Appearance beautiful. Not sufficiently firm for distant markets, but just the berry for home use, and near markets. See our *Circular of new sorts* for fuller description, fine cut of the fruit, etc. \$2 per doz.; \$10 per 100.

Prak's Emperor.—Originated by E. Peak, of South Bend, Ind. Very large size, single specimen often measuring 4½ inches in diameter, and of larger weight. Highly recommended by the Agricultural, but more rarely, and does not submerge. Fruit equal in flavor, but far superior in productiveness with us. Fruited from June to September. It is a very intelligent amateur and best judge of fruits in our acquaintance, as, excelling in *uniformity and great size, flavor, for home use, and near markets.* See our *Circular of new sorts* for fuller description, fine cut of the fruit, etc. \$2 per doz.; \$10 per 100.

Rouley's Seedling.—Originally obtained by us from Joseph Foster, of Kingston, N. Y. A seedling of Triomphe de Claret, but more productive, and of larger size. Highly recommended by Chas. Downing and others. \$2 per doz.; \$10 per 100.

Apollon III.—Plants originally obtained from Edward Evans & Co. \$3 per doz.

Charles Dore.—Is undoubtedly one of the most valuable sorts grown. \$1 per doz.

Dr. Nicot.—Fruit enormously large. \$2 per doz.; \$10 per 100.

Micron.—Wonderfully productive, and keeps in fruit a long time. \$1 per doz.; \$5 per 100.

Perpetual Prince.—Yields 200 lbs. per acre. \$1 per doz.; \$10 per 100.

James' Mammoth.—Enormously large, solid, and productive. Surface very firm, sufficiently so to carry to the most distant markets without bruising. We noticed N. Y. papers quoted this sort *higher than any other* in market. 20 cents per doz.; \$1 per 100. The following sorts at 30 cents per doz.; \$2 per 100: December, Durand, Philadelphia, Ripovam, Leung's White, Golden Queen, and Perry's Seed-

ling. The following at 20 cents per doz.; \$1 per 100: Jenny Lind, Downer's Prolific French, Early Washington, Ida, Metcal, New Jersey Scarlet, Wilson's Albany, Rooker, Fillmore, Shaw, Russell, Buffalo, Green Prolific, Agriculturist, and Triomphe de Claret.

BLACKBERRIES.

New Rochelle, or Lawton, and Dorchester, 8 cents per doz.

Crystal White, and Kittatinny, \$2 per doz.; \$10 per 100.

Early Wilson and Missouri Mammoth, \$3 per doz.; \$20 per 100.

Houghton Seedling Gooseberry, \$1 per doz.; \$5 per 100.

CURRANTS.

Red Dutch, \$1 per doz.; \$4 per 100. **White Grape, Cherry, and La Versa, Blackcap,** \$2 per doz.

GRAPES.

Clinton, Isabella, Catawba, and Concord, 15 cents, each; \$1.50 per doz.; Hartford, Creveling, Diana, Delaware, Iowa, Israella, Adirondack, Ives' Seedling, Norton's Virginia, 30 cents, each; \$3 per doz.

Illustrative Catalogue.—Gives all necessary information for planting, growing, etc., so plainly, that any person can learn from it just what to do, and how to get the *surest and best* crops. Price 10 cents. WHOLESALE LIST, and LIST OF NEW SORTS, also, TERMS TO AGENTS AND DEALERS, sent on application.

Please preserve above prices, and *renewable*, if any party offers one of above at less rates, *we will sell the same*. Plants sent out at the proper time, and orders filled in rotation as received. Sent in other papers, but not safely, when desired. Large packages packed and delivered free of charge at express office. Address

PURDY & HANSTON, Palmyra, N. Y.

N. B.—Plants will do much better, and increase fully double next season, if set this fall, instead of next spring. All that is necessary is merely to throw a little litter over them, to prevent ground from heaving. A plot of one acre of strawberries, set last of Oct. and first of Nov. last, yielded this season sixteen bushels of fruit.

FRUIT AND ORNAMENTAL TREES

FOR FALL OF 1868.

We have the pleasure of announcing that we are prepared for the Fall Trade with an unusually large and well-grown stock, embracing

Standard and Dwarf Fruit Trees.

Grape Vines, new and old sorts, strong open ground plants.

Currents, Raspberries, Blackberries, and all the Small Fruits.

Ornamental Trees and Shrubs.

Roses and Flowering Plants of every description. Nurserymen, Dealers, and others, purchasing largely, will be supplied liberally, at less rates, if they order small, will receive prompt and careful attention. Parties interested will do well to order early, as the stock is small, and is just issued, and will be sent pre-paid on the receipt of 10 cents, each, for Nos. 1 and 2, and 5 cents, for No. 3.

For a full and complete Illustrated Catalogue of Fruits, No. 2, Descriptive and Illustrated Catalogue of Ornamental Trees, etc. No. 3, Descriptive Green-House Plants, No. 4, Wholesale Catalogue.

ELLWANGER & BARRY,

MOUNT ROSE, NEWBERGEN, ROCHESTER, N. Y.

PERRY'S GRAPE-VINES

FOR PERRY'S PAT. MAR 27 1866

Merit particular attention from Planters and Dealers, and to those forming Clubs, etc., for the reasons hereafter. Much attention is given to Vines for GARDEN PLANTING, from which the best results are being realized. 30,000 Standard Dwarf Fruit Trees, from two to five years old, straight, firm, and healthy. Currants, Raspberries, Blackberries, and Strawberry plants in large supply. Price list *very low*. Very desirable and superior in outdoor growth of 1 and 2 year old vines. Planters and dealers would do well to call and examine my stock or correspond. Vines warranted one year, and money guaranteed. Send for the list of the Vines, and price list. JAS. F. MARTIN, Box 113, Mt. Washington, Hamilton Co., Ohio.

HUMBOLDT NURSERIES, TOLEDO, OHIO. GRAPE VINES.

A large stock of Delaware, Ives' Seedling, Concord, Hartford, Iowa, &c., &c., 1 and 2 years old, at low prices. DEAR CAT, 2 and 3 years old, very fine. DWARF APPLES, 2 years old, very fine.

For a full and complete Illustrated Catalogue of Fruits, No. 2, Descriptive and Illustrated Catalogue of Ornamental Trees, etc. No. 3, Descriptive Green-House Plants, No. 4, Wholesale Catalogue.

IVES SEEDLING VINES.

The grape vine stock, with 1500 of the superior leading varieties, including Mr. Longworth's best seedling, selected by and being tested in connection with Dr. J. A. Warder. My stock is very large and superior in outdoor growth of 1 and 2 year old vines. Planters and dealers would do well to call and examine my stock or correspond. Vines warranted one year, and money guaranteed. Send for the list of the Vines, and price list. JAS. F. MARTIN, Box 113, Mt. Washington, Hamilton Co., Ohio.

Nesbitt's Small Fruit Nursery.

Nurserymen and others, desiring an unusually fine stock of 2 year vines of Concord, Iowa, and Creveling, at reasonable rates for retelling, or for planting, are cordially invited to examine my stock. I have a splendid stock of 1 year vines of Martha, Hartford, Concord, Iowa, Avery, &c., &c., of Clarke, Philadelphia, and Doolittle Raspberries, of Wilson and Kittatinny Blackberries; of Jamaica, French, and Wilson Strawberries. Also Early Rose, Early Goodrich, and Harrison Potatoes.

WM. L. NESBITT, Lewisburg, Penn.

GRAPE VINES.—Genuine Clarke Raspberries, Kittatinny, Wilson's Early and Missouri Mammoth Blackberries at low prices.

Sent for Price List to J. W. CONE, Cincinnati, N. J.

Bloomington Nursery.

17th Year; 400 Acres; 10 Green-houses.

For the Fall Trade we offer much the largest and fullest assortment ever shown in West.

Apple, Pear, Cherry—Standard and Dwarf.

Peach and Plum—Immense stock.

Grape Vines—Over 30 acres, 1 to 2 years, of nearly all the old and new kinds.

Watches, and Roskopf's Patented People's Watch Cases in Swedish Silver.

The Improved Aluminum Bronze is a metal differing entirely from any ever offered to the public. Its qualities and resemblance to Gold are such that even judges have been deceived. It has seriously concerned the attention of scientific men, and has not only called forth the eulogiums of the press, in consequence of its peculiar properties, but has also obtained a Gold medal at the Paris Exposition. The movements are well finished, perfectly regulated, and as all these goods are made in our own factory, I am enabled to warrant them as excellent timekeepers. Price from \$16 to \$25.

Further details will be found in my pamphlet, which will be sent post-paid, on demand.
A full assortment of Chains, also Aluminum Bronze Cases for Waltham Watches.
Goods sent by Express C. O. D., with charges.
Address **JULIUS D. HUGGINS & SONS,**
No. 34 Nassau Street, New York.

MEYER—CHIES SC

WILD TURKEYS.—DRAWN FROM LIFE BY HERRICK.—Engraved for the American Agriculturist.

The turkey is the largest and one of the most beautiful game birds in the world; it is, moreover, peculiarly our own—a genuine native American fowl. It has all the royal grace and dignity of the forest chiefs who with it have melted before civilization and the destruction of the timber. It has, however, qualities of shyness and caution, which have preserved it in some localities long after the grand hard wood forests have been succeeded by the humbler

second growth. Every State of the Union was once the home of the wild turkey, but now, east of the Alleghenies, it is almost unknown. Domestication is easily accomplished, and crosses with the domestic species are made with great advantage. The wild turkey is distinguished from others by the entire lack of white bands or tips on the feathers, by its more delicate head, the bluer color of the naked skin of the head, the longer and larger tuft of hair up-

on the breast, and by the more brilliantly metallic hues of the feathers of the neck and body. The legs are also longer and more slender. Turkeys seldom gain their full growth before they are five years old, and an old wild gobbler of large size is one of the most magnificent of birds, being remarkable for the glow of coppery red, purple and golden hues which flash over his back, and the changing tints of the peculiar carunculations of the neck.

Potatoes.—Dig when the vines are dead. Store as directed on page 364. Potatoes are not roots, and require different treatment. The tubers are fleshy underground stems. They are more sensitive to frost, and do not require the same amount of ventilation.

Sorghum.—It is best to make clean work as you go. Cut up, top, and strip at one operation; bind with two bands, and if possible have the stalks hauled at once to the mill. The seed makes good feed for sheep and other stock, and the dried leaves and suckers tolerable fodder. We would be glad to know how they compare with corn fodder.

Corn.—Husk when the corn is hard and the husks dry. Bind the stalks and set them up in well-braced stooks, bound firmly at the tops so that they will stand through a gale of wind, and shed rain. See article on Corn Fodder, page 363.

Sowing Crops.—Wheat and rye may both be sown for spring feeding. See hints last month, p. 315.

Winter Grain.—Wheat often does well sown as late as the early part of this month, but it is better, as a general rule, north of lat. 41° to sow earlier, and to put in rye if the time has passed by, even though the land be prepared for wheat. Rye may be sown any time during the month on good land with assurance of a well paying crop.

Draining.—This is one of the most favorable seasons for pushing ahead this kind of work. Labor is usually cheaper, and it interferes less with the work of the farm—either by disturbing the fields, or taking hands from other work. Make thorough work; half-way work never pays in the long run.

Weeds.—On wet days cut weeds, put them in heaps, and burn them when dry. The ashes will be of some use; the seeds will be killed.

Buildings.—Push forward all necessary repairs; tighten up barns and sheds, look out for loose clapboards, and patch shingle roofs. It is not best to re-roof barns at this season when they are full of hay. Many nails in hay are often fatal to cattle and horses, and a few are bad for their teeth, and also for hay cutters of all kinds.

Cooking Hay for Cattle kills weed seeds, many of which would otherwise pass through the animals, and grow when carried to the field in manure.

Work in the Horticultural Departments.

The leaves have done their work! All summer long they have taken the sunlight and given off nothing but green, but now that their work is accomplished, they and the sun are having a gala time of it, and they throw his light back in crimson and gold. The fruit, too, which has heretofore been green, now splashes itself with carmine, and turns its ruddy cheek to the sun. The Great Artist puts the last touches to the fruit in the beautiful waxen bloom that betokens perfection. The harvest of the orchard and the great harvest of the forest are this month gathered. The ripe leaves lighten the scene with their transient glow, and dutifully fall to the earth to give up what they have received. Did you ever look at the place from which a leaf has fallen? Is not there a bud all ready for next spring's work? Is not there a lesson here, when even an inanimate leaf, as we are accustomed to call it, thus early makes provision for another year? We might dwell upon this point, but as old Boerhaave says: "I have said enough for those who take me, and for those who do not, nothing would be enough."

Orchard and Nursery.

Picking of the late varieties of fruit is mainly done this month. Hand picking with every care to avoid bruises is the only method to be commended. Place the fruit carefully in bins or on shelves in the fruit cellar, or put in barrels at once.

Barrelling should be done in clean new barrels; take out the bottom head, place the fruit in regular layers, and fill to about an inch above the cline; bring the head into place by means of a screw or lever press. A few of the apples next to the head will be indented, but the rest will be held in place and will not bruise in transportation. Turn the

barrel over and mark the top with the name of the variety. Never put more than one kind in a package and keep poor fruit out altogether. Keep the fruit, whether in barrels or not, at as low and uniform a temperature above freezing as possible.

Late Pears may be treated the same as apples. Autumn varieties should be placed on shelves where their progress in ripening may be watched.

Cider Making.—The best cider is made from the best fruit. A rich saccharine juice is needed to make the finest article. Assort the fruit and convert the inferior lot into vinegar. Put the juice into clean casks, and allow the fermentation to go on slowly in a cool cellar. When the fermentation has ceased, rack off into other clean casks and bung up.

Vinegar.—A good article of cider vinegar finds a ready sale. See article on vinegar on page 367.

Pomace may go to the piggery or into the compost heap. If seeds are wanted, wash them out before the pomace ferments. In washing large quantities a continuous stream of water is required. This is run into a box in which the pomace is placed. The pomace being stirred the lighter portions are carried off by the flowing water, and the heavier seed remains. Collect and dry it.

Planting may be done if the land is in good order. Lay out the ground beforehand, either in regular rows or in the quincunx order. The last plan allows the land to be occupied to the best advantage. For details and other hints on laying out an orchard see last March *Agriculturist*, page 102.

Labels are often so wired to nursery trees as to cut the bark when growth commences. See to these as the trees are planted. While labels are convenient for reference in the orchard, do not trust to them, but have a record or map of the position of each variety. Plant the same variety together.

Nursery Stock.—Look to that budded this autumn, and loosen the tyings if needed. Manure between the rows of the older stock, and cut back the growth to give a proper shape to the trees.

Fruit Garden.

Planting of shrubs and trees may be done whenever the autumns are usually mild, and it is better to do it now with the blackberry and raspberry than to wait until spring, as the buds start early.

Raspberries and Blackberries when set out should have the canes cut back to the ground. If left, a slight crop may be gathered next summer at the expense of the future welfare of the plants. Raspberries may be set from 4 to 6 feet apart and blackberries from 6 to 8 feet. If grown as a hedge, they may be placed much nearer, say half the distance.

Gooseberries and Currants may be pruned whenever the leaves have fallen. Cut out as much of the old wood as will leave the bush open, and shorten this year's growth one-half, more or less, according to its vigor, cutting back the weakest shoots the most severely. Use the prunings of new wood for cuttings.

Cuttings, which are to be about 6 inches long and planted 4 inches apart in trenches, with only an inch above the surface. Ram the soil firmly against the base of the cuttings, and cover the bed with leaves or litter when freezing weather comes on.

Grapes.—Full ripeness is desirable, whether they are to be used for the table or for wine. Grapes to be packed for winter should be allowed to stand a few days to "cure." They are then put in 5 or 10 pound boxes, which are to be packed full, the cover, or bottom rather, crowded on with a slight pressure and nailed. The boxes are then to be kept in a cool, dry room at a uniformly low temperature, but the fruit must not be allowed to freeze.

Strawberries started in pots may still be planted.

Kitchen Garden.

Prepare the Soil for spring crops. Sod ground may be manured and plowed, as well as land from which crops have been removed. Plowing is now much more easily performed than in spring. Stiff land should be thrown into ridges, to get the benefit of the ameliorating action of the winter's frosts.

Protection to those crops left out over winter ought not to be given too early. All of these plants are nearly hardy, and there is danger of smothering them if covered too soon. Many things make a good growth in the warm autumn days.

Preserving Roots, etc.—Only in very cold localities will roots need to be stored for winter as early as this month. It is best, however, to have everything ready to store and house the crops should heavy frosts make it necessary. If cellars are used for storing, have bins, barrels, etc., ready. Pits are better than cellars. They must be made in dry ground, where the water will drain off. They are made 3 or 4 feet wide and 6 feet deep. A section 2 feet in length is packed with roots, then 6 inches from that another similar section, and so on. The spaces between are filled with earth, and later in the season all are covered with earth. This is only done when freezing weather is at hand.

Asparagus.—When the tops turn yellow, cut and burn them. Do not put them in the compost heap, as the seeds retain their vitality, and if distributed in manure produce troublesome "weeds."

Beets.—Let them grow until hard frosts are at hand; then dig and store in pits or in the cellar.

Cabbages.—Prepare frames for wintering young plants, which should be a foot high at the rear and 8 inches in front, wide enough for the sash to be used, and as long as needed. They should be set on light soil and where water will drain off readily. The plants are to be set 2½ inches apart each way, deep enough to cover all the stems. Do not cover with sash until the approach of freezing weather.

Cauliflowers.—The young plants to be wintered are to be set as directed for cabbages. Gather the late crop as it is ready. There are often many plants that do not head. These, at the approach of frosty weather, should be set in a pit or light cellar, and many of them will form heads.

Celery.—Finish earthing up. The earth is to be banked up against the stalks nearly to the top of the leaves. In most places, next month will be early enough to store it away for winter.

Lettuce.—Young plants may be set in frames, as directed for cabbages. In warm localities young plants of the hardy kinds, covered with leaves or other light litter, will pass the winter safely.

Horseradish is to be left in the ground until frost, when it is to be dug and preserved like other roots.

Rhubarb.—Where vegetation is at rest, new plantations may be made. Cut an old root so as to leave a bud to each piece, and plant in rich soil.

Spinach.—Keep the late crop clean. In cutting for use, take it from those portions of the rows that are most crowded and need thinning.

Squashes.—See article on preserving on page 363.

Sweet Potatoes, when the vines are first touched by frost, are to be dug. In digging and handling be careful not to bruise them. Those to be kept should dry for a day in the sun, and then be packed in sand, cut straw, or leaves. Whatever material is used must be perfectly dry. Keep in a warm and dry place, where the mercury will not fall below 60°.

Flower Garden and Lawn.

The weather is now more favorable than in spring for all work like grading, road and walk making, draining, laying out borders, and the like.

Lawns.—In preparing for these a deep and rich soil is necessary, and usually drainage is required.

House Plants that have been during summer in borders should not be left there too late. See article on the treatment of these, page 370.

Chrysanthemums, especially of the tall-growing kinds, will need stakes; the weight of bloom, especially when wet, is apt to break them down. Pot for house blooming when the buds are well developed.

Perennials of most kinds need to be taken up every few years, divided and reset.

Renions.—These almost always fail to flower if removed in spring. Take up the roots early this month, while they are dormant, divide so as to have a bud with each piece, and plant in deep, rich soil.

Hardy Bulbs are sufficiently noticed on page 370.

Tender Bulbs, such as those of *Glaadiolus*, *Jacobean Lily*, Mexican Tiger Flower, etc., are to be taken up when the leaves are killed, dried a little, properly labeled, and stored in a cool, dry place, where they will not freeze or be troubled by mice.

*Dahlia*s are to be left awhile after the frost kills the stems. Take them up in the morning of a dry day and let the roots remain in the sun to dry off, label securely, and store them where they will not freeze or be too damp. The same treatment may be given to tubers of the *Madama* Vine.

Trees and Shrubs.—All the hardy deciduous ones may be transplanted now, and hedges of deciduous shrubs, such as *Buckthorn*, *Privet*, etc., may be set.

Protection to half hardy things should not be applied until quite cool weather. The object is not so much to prevent freezing as to avoid frequent changes. Materials should be in readiness. Collect leaves from the lawn or wherever they can be found. One of the best materials is the boughs of the Red Cedar. Where these can be had in abundance a good supply should be laid in. A coating of light peaty earth upon beds of seedlings of perennials serves as an excellent protection. Salt hay, readily procured near the coast, is a favorite material with gardeners living in those districts.

Green and Hot-Houses.

The more tender plants are to be taken in first. Have the pots in good order. Top-dress the plants by removing the surface soil and giving a supply of rich compost. Have the plants when taken in free from

Insects, the fight with which must be always on the offensive, and prevention is better than cure.

Bulbs.—Directions for potting, etc., are given on page 370. Whenever the ball of earth is well filled with roots, the pots, a few at a time, may be brought in and the plants forwarded.

Forcing Plants.—Many of the perennial herbaceous plants and shrubs are used for forcing. In France the *Lilac* is forced in large quantities. Those most commonly treated in this way here are *Lily of the Valley*, *Dicentra*, *Dentzia gracilis*, *Wiegela*, *Asiatica* (*Spiraea*), *Japonica*, etc. The plants are to be potted and kept in a cool place until it is desired to bring them into flower.

Cuttings of bedding plants should be made at once, if it has not already been done, and seeds of *Annuals* for winter blooming be sown.

Pots and Soil and all necessary materials for winter use should be got under cover before winter.

Ventilate as much as the weather will allow, and make the transition from free air to the confinement of the house as gradual as possible.

Cold Grapery.

The function of the leaf is not generally understood. An intelligent person asked us the other day why we did not strip off the leaves from a vine, and it seemed to be news to him that they would drop of themselves when they were no longer needed. The leaf is only a temporary appendage, as is shown by its being jointed to the vine. When the vine has no further use for it it falls. Keep the house rather warm by the use of the upper ventilators only, to finish the ripening of the wood, but close all up in damp and cold weather.

The Fairs for 1868.

Time for Wheat.—"P. T. M." Dayton, O. "Will time secure good wheat crops upon our Western soils?" The favorable wheat crops of Pennsylvania, to which you refer, are not secured by time alone. The time is applied but once in a rotation of from five to seven years, and then with Indian corn on soil. Oats follow the corn, and manure is spread and plowed in for wheat. Your lands want ammonia quite as much as lime.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Sept. 14, 1893, and for the corresponding month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.						
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days this mth.	297,500	431,000	2,189,000	23,000	91,000	611,000
27 days last mth.	106,000	577,000	2,885,000	3,500	41,000	635,000

SALES.						
	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days this mth.	281,200	1,112,000	2,908,000	80,000	1,250	1,596,000
27 days last mth.	315,000	1,189,000	3,118,500	21,000	—	1,385,000

2. Comparison with same period at this time last year.						
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days 1892.	297,500	431,000	2,189,000	23,000	91,000	611,000
27 days 1891.	215,500	529,000	2,291,000	36,000	53,000	570,000

SALES.						
	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days 1892.	281,200	1,112,000	2,908,000	80,000	1,250	1,596,000
27 days 1891.	281,000	1,079,000	4,181,000	131,000	—	1,397,000

3. Exports from New York, Jan. 1 to Sept. 14:

	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
1892.	61,533	3,855,678	5,501,215	153,963	42,749	—
1891.	67,000	3,801,000	6,291,000	103,719	306,298	—
1890.	62,132	3,200,651	8,856,410	181,739	966,303	118,596

4. Stock of grain in store at New York:

	Wheat.	Corn.	Rye.	Barley.	Oats.	Malt.
1892.	216,519	2,148,290	—	16,590	256,427	91,024
1891.	285,370	1,831,408	—	18,409	292,851	92,885
1890.	370,919	1,400,412	28,891	541	290,825	37,128
June 12.	257,000	1,286,711	51,490	575	292,884	11,205
May 12.	322,812	1,608,611	33,341	—	332,491	5,703
Apr. 13.	686,630	1,238,550	8,376	13,255	301,191	—
Mar. 13.	1,143,340	1,019,322	45,542	46,614	1,191,212	11,000
Feb. 13.	1,506,679	1,705,280	181,111	103,890	1,151,191	62,267
Jan. 13.	1,616,415	1,431,353	200,300	213,310	2,373,828	60,389

5. Receipts at head of tide water at Albany, each season to Sept. 7th:

	Wheat.	Corn.	Rye.	Barley.	Oats.
1892.	1,848,500	1,848,500	11,227,300	177,900	333,600
1891.	1,848,500	1,848,500	11,227,300	177,900	333,600
1890.	1,848,500	1,848,500	11,227,300	177,900	333,600
1889.	1,848,500	1,848,500	11,227,300	177,900	333,600

self to breeders of animals, whether on the large or small scale, to growers of plants, and indeed to the intelligent and curious generally. The book is one of such importance that Dr. J. D. Hooker, President of the British Association, thus referred to it in his inaugural address. "Mr. Darwin's recent two volumes on 'Animals and Plants under Domestication' are a catamount of data, observations and experiments, such as assuredly no one but himself could produce. It is hard to say whether they are most remarkable for the number and value of the new facts they disclose, or for the array of small forgotten or overlooked observations, neglected by some naturalists and discarded by others, which, under his mind and eye prove to be of first rate scientific importance." The work has been only about seven months before the public, and there have been two English, a German, Russian, Italian and American edition already published. The American edition contains all the author's additions, and is the most complete of any. Two handsome volumes, illustrated, and with a copious index, sent by mail for \$6.

Splendid Premiums, such as have never been equaled in this or any other Journal, are offered by the Publishers in the premium sheet of this number of the *Agriculturist*. The premiums include nearly all of the excellent articles offered last year; other good new things, such as the Early Rose Potato, Watches made particularly for us, Field Croquet, etc.; and especially a fine lot of Breeding animals. We would like to impress the fact, for it is a fact, that one or more of the premiums can be obtained at every Post-Office in the United States and Territories, in British America, etc., etc. Human nature is the same everywhere. What was done in 3,000 to 4,000 places last year can be done in 35,000 places this year. The work will pay well, and do good besides. Every one read through the premium sheet.

"How Crops Grow."—This is the expressive title of a new work by Professor S. W. Johnson, of Yale College, just published by Orange Judd & Co., and announced in an advertisement on another page. This work supplies a great lack in English literature, and, in fact, in the agricultural literature of the world. It brings to the careful reader interested in the practical operations of the farm and garden those profound results and views of science which lie at the basis of scientific agriculture. The subject discussed is by no means all of agriculture. The book is a guide to the knowledge of agricultural plants, their composition, their structure and modes of development and growth; of the complex organization of plants, and the uses of the parts, the germination of seeds and the food of plants, obtained both from the air and the soil. Very full and accurate tables of analyses are given, and tables of the proportions existing between different principles, oily, starchy, or nitrogenous, in the same and different plants. The book is an invaluable one to all real students of agriculture. It is fully illustrated, and will be sent by mail for \$1.50.

Whitlock's Grape Show.—An exhibition of grapes will be held in Mr. Whitlock's rooms, in the *Agricultural* building, beginning on the 1st inst. Mr. Whitlock has much better facilities for exhibitors than we are able to give, and we shall hold no grape show this year. We hope that the friends who helped us to make last year's the finest show of native grapes ever seen in this country, will enable Mr. Whitlock to excel that, if possible. Interesting discussions may be expected on the days of exhibition, to which all are invited.

Spring Balances.—"J. D. K." Toledo, O., asks "if the ordinary spring balances are trustworthy?" Serious suspicion has fallen upon them, from the fact that they are so popular with retailers. It must be a very well tempered spring, better, we fear, than gets into our balances, that does not grow weak by habitual use. This weakness, however small, makes an error in favor of the seller. The Canadian government has prohibited the use of spring balances in the Dominion, and we suppose they are of the same kind used this side of the line. It will be well for our housekeepers to weigh their purchases, when they get home, and for the scales of weights and measures to look after the parties who use spring balances. If purchasers find short weight, they can refuse to trade henceforth with those who use them, and thus drive the balances from the counter.

The Tim Bunker Papers.—Squire Bunker, whose letters, published through many volumes of the *Agriculturist*, have given farm matters at Hookertown a world-wide celebrity, has collected his writings, and Orange Judd & Co. have published them in a neat volume of 312 pages. The long-time readers of the *Agriculturist* do not need an introduction to the Squire, as they look upon him as an old friend. Though

T. B. Esquire, writes in the Connecticut vanguard, there is more sound common sense, and real information upon agricultural matters in this work, than is to be found in any more pretending volumes. His old friends will gladly welcome the collected writings of Mr. Bunker, and we promise those who are not familiar with them, not only instruction but amusement from their perusal. The distinguished artist Hopkin has tried his pencil on some of the inhabitants of Hookertown, and given a series of characteristic illustrations. Price by mail \$1.50.

Increase in the Consumption of Sugar.—There is a good time coming for the sugar producers, if we may rely upon the statistics given in *De Bow's Review*. The Anglo Saxon race use 1,140,000 tons of sugar per annum, or 41.40 lbs. per head. The Latin race use 12.34; the Teutonic, 7.50; the Slavonic, 3.30. The total consumption of the countries from which returns can be obtained is 2,030,000 tons; about 15 lbs. per head. If it were increased to the standard of Great Britain it would amount to 6,150,000 tons. As the nations gain civil and religious liberty and advance in civilization, they increase in their ability to enjoy the comforts and luxuries of life. The people of the United States use fifteen times as much sugar per head as the people of Russia, Poland, Turkey, and Greece.

Black Pekin Egg Plant.—Those who have tried this variety give good accounts of it. It is a very vigorous grower, and bears abundantly of large and almost black fruit, which is most excellent upon the table.

Writing a Volume.—Some correspondents ask so many questions at once that it would require a small volume to answer all of them. They often ask us to tell them "all about" the culture of fruits, or have a certain number of acres that they wish us to lay out for them. While we are not only willing but glad to answer questions, we cannot write treatises every month.

The American Entomologist.—The first number of this paper, devoted to "bug" literature, has appeared. It is a neat monthly, of 30 pages, well printed and illustrated. The articles are exceedingly popular and practical in character, and have a liveliness not often found in writings on scientific matters. Published by R. P. Studley & Co., St. Louis, Mo., at \$1 a year.

The Eumelan Grape.—This is a chance seedling which originated on the banks of the Hudson. Dr. Grant, perceiving its merits, purchased it some time ago. The grape is of first class as to quality, and ripens at least as early as the Hartford Prolific.

Sundry Humbugs.—Congress, in an act "To further amend the Postal Law," passed July 27th, 1898, Sec. 13, says: "And be it further enacted, That it shall not be lawful to deposit in a post-office, to be sent by mail, any letter or circular concerning lotteries, so-called gift-concerts, or other similar enterprises offering prizes of any kind on any pretext whatever." We again bring prominently before our readers this Section of the postal law, so that none need err through ignorance or misunderstanding. It is desired at Washington that all evidence bearing upon guilty parties be sent to them, and we trust that all will bear in mind the suggestion made last month, and when they receive letters of the Gift-Enterprise sort request their postmasters to send them to the General Post-office.... We have to notice this month: Hunt, Anthony & Co.; Gold Watches, valued \$175, for sale at \$10 each. Gentlemen, the design of your certificate is too odd and well-known to mislead our readers. Can't you try something new?... We have thus far failed in every endeavor to find the parties advertising very largely as C. A. Taylor & Co., and M. Noyes & Co., No. 80 Nassau-street. These two firms are evidently one and the same, apparently differing only in name. The person or persons who manage the thing represent themselves as "General Agents" for the "Managers," etc. Their plan proposes for \$10 to rob their managers of \$1,200, and to send the same to any person furnishing the original \$10, provided that the receiver on his part will show the money to his neighbors and say he got it as a chance lottery prize in said company. "You are to show the money. The result will be that hundreds of dollars will be sent to us for tickets, etc., which they, of course, will pocket. Here it is in a nutshell." We will help you to \$1,200 of our managers' money, if you in turn will help us to rob your friends and neighbors. A nice little plan this! We think the proper authorities should hunt such scoundrels up and bring them to justice, and that whoever owns the building should clean it out.... Dr. J. S. Scoville & Co. have succeeded in swindling the public by means of travelling agents in some parts of the West. All persons

will remember that no such firm can be found at the number given, or in our City Directory. Dr. A. B. Church, Columbia, Ind., puts forth most infamous teachings, which should not be followed by any body.... The "Great Western Gift Co.," Evansville, Ind., Frederick Edwards & Co., Managers, are on the "make," and propose to send any body a "fortune for ten cents." Pretty good, Mr. Edwards; please send us one, marked C. O. D. We have carefully figured out the probable expense and income of this concern, and we give it for the benefit of our readers. Amount offered in prizes, \$435,400. No blank tickets. No prize worth less than \$1. Suppose no prize would exceed one dollar in value, then it would stand thus: 435,400 tickets at 10c, each amounts to \$43,540 for \$43,540 in prizes!! This would seem absurd enough, but far greater absurdity is shown in the ostensible scheme. The first 3,211 prizes represent \$231,550 at least, in prizes ranging in value from \$5 to \$50,000 each; a ticket for each of these prizes at 10c. will bring \$321.10. The remaining sum—supposing one ticket to every dollar would require 230,550 tickets at 10c each—would be \$20,555.00 for prizes amounting to at least \$230,550. The total amount, then, for all tickets is \$39,075. Fifty per cent of this is offered to agents for selling tickets, and then comes in the long list of expenses for printing, office rent, clerk hire, etc., etc. But suppose \$10,000 to pay all expenses including per cent to agents, the net income would be \$10,075, and the out-go in prizes \$435,400!!! Friends, don't you want a fortune for 10 cents? We have given the above figures thus minutely to enable all to see at a glance the absurdity of such swindling concerns. All lotteries are more or less after this same plan. They offer much for a little, and their own schemes, if followed like the one above, would soon ruin them; but they don't follow them, nor do they even pretend to; the sole aim of these scoundrels is to induce people to send them money, and once in their pocket, it is never seen again by the sender in any form.... Beware of one G. W. Parsons. We are informed that he has been getting subscriptions at Mt. Gililand, Ohio, for this and many other papers. We have received no subscriptions from him—do not know him, and set him down as a humbug.

The Comparative Value of Grapes, other things being equal, depends upon the amount of sugar contained in the juice or must. In view of this fact, the Pleasant Valley Grape Growers' Association will hold at Hammondspoint, Steuben County, N. Y., a saccharometer test on the 28th inst. The saccharometer is an instrument for indicating the amount of sugar contained in the juice, and the Association proposes to subject all the samples of grapes to the test, that may be sent for the purpose. The committee is one in which the public may have confidence, as it includes persons interested in grape culture from all parts of the country. The circular of the Association says: "A general invitation is hereby extended to all who have grapes of value or promise, new or old varieties, to be present and participate. No effort will be spared to make the meeting both interesting and profitable to all who may attend. Persons wishing to have their grapes examined, and being unable to attend in person, may forward them to this place, in care of George W. Nichols, President of the Association, who will pay charges and see that they are justly dealt with. It is desirable that as many as ten pounds of each variety be sent, to insure a full examination; but a smaller quantity will be accepted, and given all the attention possible. In all cases they should be accompanied with a statement giving name, kind of soil, age of vine, &c. Truths and facts alone are sought after, therefore no premiums are offered or will be awarded."

A "Vine Borer."—In Missouri a borer kills vines by cutting them off at a distance of 8 or 10 inches below the surface. C. V. Riley, State Entomologist, has the chap under surveillance, and we shall probably have his portrait and history in the *American Entomologist*.

A Peach Fungus.—Dr. Hull, as we learn from the Transactions of the Horticultural Society of Alton, Ill., finds a fungus upon the roots of peach trees, which speedily exterminates them. As it spreads from tree to tree, his treatment is to destroy the fungus by burning all diseased peach trees, root and branch.

The Scuppernong Grape.—Mr. M. T., Garrett, S. C., sends us some specimens of this grape, which is now becoming an important fruit in those Southern States where the climate is suited to it. The wine has many remarkable peculiarities, and we hope to refer to it more in detail at another time.

The Casabar Melon.—Mr. Henry A. Dreer, seedsman, of Philadelphia, sent us specimens of a melon, the seeds of which he received under the above

name. It is evidently one of the Persian melons. One of the specimens weighed 12 pounds, and if there is a more sugary, tender-fleshed, and altogether good melon than this, we should like to see it. Mr. D. says that some call it the Large Persian. This melon, "by any other name would taste as sweet."

For All Children, Toy Dealers, Variety Stores, etc.—For the benefit of the "little people," we have encouraged the manufacture of a good stock of "Crandall's Building Blocks," which we consider the best instructive toy ever produced—one furnishing amusement without end almost, and not a simple toy to lose its novelty in a day. During the summer our artists have got up engravings of a portion of the numberless structures made from a single box of these blocks. These engravings are combined on a sheet, which is a picture of itself. Copies of it will be sent free to all Toy Dealers, Keepers of Variety Stores, Merchants, and to families desiring one. Send application and address to the Publishers of the *Agriculturist*.

Elements of Agriculture.—Col. Geo. E. Waring, long known as an agricultural writer, has re-written his earliest work, and it is now published by the Tribune Association. This little work is eminently practical, and is written in a plain, simple style. Statements of agricultural theory of the present day are less positive than they were a few years ago, and Col. Waring has exhibited commendable discretion in carrying his readers over the hard places in a very common-sense way. It is the best book we know of to explain to a young farmer the reasons for correct farm practice, that can be bought for anything like the price, which is \$1.00.

Strawberry, President Wilder.—In the *Agriculturist* for August last, Wilder's No. 13 was noticed as an excellent fruit, and the wish then expressed that it might bear Col. Wilder's name has been complied with. The berry is to be known as President Wilder. The publishers of the American Journal of Horticulture have, with commendable enterprise, purchased the whole stock of plants, which they offer as premiums to subscribers to their journal for 1869. Horticulturists thus will have an opportunity of testing a new variety of great merit, and one which it is hoped will prove elsewhere as fine as it has upon the grounds of Col. Wilder.

Plants Named.—"Subscriber," Bristol, Ind. Wild Yam-root, *Dioscorea villosa*, sometimes called as a climber....C. C. Moore, Johnson Co., Kansas. Feathered Hyacinth, a variety of *Muscari comosum*....C. M. Burgess, New Britain, and Mrs. S. A. P. St. Jo. Co., Mich. The "foliage plant" is *Coleus Verschaffeltii*. It is very tender, roots readily from cuttings, but is rather difficult to keep through the winter unless you have a greenhouse. The flower is small, something like that of Mint, and not showy....M. R. A. Elliot, Me. No. 1, Twin-flower, *Linnaea borealis*, named for the great Linnaeus; No. 2, Bitter-sweet, *Solanum Dulcamara*; No. 3, only broken leaves without flowers....G. W. C., Benton, Tenn. No. 1, *Panicum rotundum*, has no common name, not poisonous; please send some bulbs by mail. No. 2, Blue-bottle, *Centaurea Cyanus*. No. 3, Japan Globe-flower, *Keria Japonica*, not a rose, though related to it. No. 4, Indian Currant or Corn-berry, *Symphoricarpos vulgaris*....J. J. M., Henry Co., Mo. An Evening Primrose, *Oenothera*; cannot tell the species without seed-pods....Mrs. P. A. St. Joseph Co., Mich. The prickly leaved "Apple geranium" is some *Solanum*, but cannot tell which from leaves alone....M. E. J., Harrisonville, Ill. *Cladidius ramosus*, Sward-billy....J. H., Ottumwa, Kan. *Euphorbia marginata*....O. B., Brumfield, Ky. Dodder, *Cuscuta Oroonoi*, common as a parasite on shrubs, etc., both East and West....W. C. C., Joppa Village, Md. The grass which came up in your yard is the Canary-grass, *Phalaris Canariensis*; not valued for forage.

Mr. Buchanan's Sale.—Mr. Isaac Buchanan, the well-known florist, will sell at his grounds at Astoria on the 7th a large lot of his choice specimens. We have seen the plants, and can assure those who wish to stock their houses with well-grown Camellias, Azaleas, etc., that a rare opportunity is presented to do so.

Horticultural Exhibitions.—"A Secretary" says that the reason we get no more notices of horticultural exhibitions is that in many cases the agricultural societies advocate a combination with them, and the result is neither an Agricultural nor a Horticultural exhibition, but a horse-race. He asks: "Cannot this evil be remedied in some way?" Certainly; when asked to combine, don't do it. But few plants will flourish in the shade of others, and the same thing holds good with societies. Horticultural societies should have their shows

separate, if they are held in a private house and only the members attend. The writer was one of the founders of a now prosperous society which began thus humbly.

Reid's Nursery at Elizabeth has long been a sort of pomological Mecca. The faithful will regret to learn that the old place is to be invaded by improvements, and that the grounds are to be cut up by streets and avenues. Mr. D. D. Buchanan, Mr. Reid's successor, is offering his stock preparatory to breaking up at the old place and removing to a new one. It is gratifying to know that the home grounds are not to be disturbed, and that the beautiful hedges and specimen plants that have afforded gratification to so many will still remain as a memento of one of the fathers of American horticulture.

The N. Y. Grape Growers' Association will hold its first Annual Fair at Canandaigua on the 7th and 8th. It is intended to include the grape, its product, and the implements which pertain to its culture, gathering, preparation for market, etc. Articles may be sent to M. Dwight Minger, Canandaigua. But who do make up the committees? There are men on some of whom profound ignorance of fruit makes us think that they were put there as a joke. Still, there are enough eminent pomologists associated with them to keep them from blundering too badly.

Peach and Nectarine.—Just as the article on page 371 was put in type, where reference is made to peaches and nectarines growing on the same tree, we received from Mr. H. Downie, Winchester, Kansas, specimens of both fruits from the same tree. We cannot "explain the phenomenon," as Mr. D. requests. The nectarine is a sport of the peach, and may come by variation in the seed or by bud variation. The breaking out of an inherent quality in plants and animals is the foundation of an ingenious hypothesis by Mr. Darwin, who presents it at length in his work on Variation of Animals and Plants under Domestication.

Trouble with Crab Apple Leaves.—J. W. Sparkman, Clifton, Tenn., sends some leaves of the Wild Crab Apple, which have large, rusty colored spots on them, and altogether in a bad condition. He states that he affects trees in the orchard and "is satisfied that it is caused by insects." Insects have enough mischief to answer for, but in this instance they are not guilty. The microscope shows the spots to be collections of minute parasitic fungi, of the kind called *Crab-apps*. It is *Eddium Pyramum*, first described by Schweinitz in 1832. A description would be too long for a basket article, but we will endeavor to figure it at another time.

Insect Named.—G. Williams, Jefferson Co., N. Y. The common name is "Walking Stick," as the insect looks much like a twig with long legs to it. It is figured in Harris' Insects, under the name of *Spectrum formicoides*. It lives on young shoots, but is never abundant enough to do much harm.

Clover Gone Crazy.—A lady in Pittsfield, Mass., sends us a set of clover leaves having respectively from four to nine divisions. The "nine-leaved" clover is almost like a green flower.

Hygro-bareometer.—"W. A. K." Middlebury, Conn. We have not seen the instrument referred to, and cannot give an opinion.

A "Horned" Caterpillar.—Several have sent specimens of a large green caterpillar with long horns or spines on the fore part of its body. These spines are orange colored with black tips. This is the larva of the Royal Walnut Moth, *Ceratocampa regalis*, which feeds on the Walnut, Ash, and Persimmon. The moth is 5 or 6 inches across, of dull colors, and not showy.

The Plantain Pest.—"Montgomery" has a new piece "on which the Plantain has taken forcible possession, of what ought to be a lawn, and overgrown all the grass." He has tried hand weeding, but finds it slow and costly, and adds: "Nothing gives a home a more neglected appearance than their broad array of leaves, surmounted by thousands of seedy spikes, ready to dispute in the future every inch of ground." Hand weeding is the only remedy. If done when the plants are young it is not so much of a job. The lawn never should be so long without mowing as to allow any broad leaves or spikes to grow. A good lawn is not to be had without labor.

Succotash.—This dish is popular wherever it has been introduced. To make it of the best quality,

sweet corn should be used. To a dozen green ears, cut or scraped, add a quart of shelled Lima beans. Boil an hour. Season with sweet cream or butter, salt, pepper, a little autumn, and a tablespoonful of refined sugar. If the Lima beans are not to be had, Marrowfat or White Kidneys are a tolerable substitute. Lima beans can be dried green for this dish, and they are much better than those fully ripened. If succotash is made of dry materials in winter, more cream and sugar should be added.

"Night-blooming Cereus."—"J. S. B.," Ligonia, Pa. The flower sent is not the Night-blooming Cereus, *Cereus grandiflorus*. It was in such a state of decay, that no satisfactory examination could be made, but from the description of the plant it is more like the Peruvian Cereus (*C. Peruviana*), and it may be that species. The buds you speak of are young branches.

Coloring Carpet Warp.—A correspondent wishes to know the best way to color carpet warp of a tan color. Who will tell him?

Insects on Cherry and Pear Trees.—"G. G.," Egg Harbor City, N. J. The caterpillar is that of one of the *Flag-moths*, and was figured in October, 1864. It belongs to the genus *Limacodes*, so named from the slug-like movements of the larvae...."C. M. B.," New Britain, Conn., sends another caterpillar, allied to the above, from a pear tree. We have never known them numerous enough to be troublesome.

Pears Cracking.—"L. L.," Portsmouth, N. H. We cannot tell you why pears crack. Some varieties will do it, and the best way is to graft the trees over with some sort known to succeed. The Finnish Beauty, which gives you so much trouble, is generally anything but a "beauty" in localities near the coast.

Horseradish Grater.—Geo. A. McCoy? (no date.) You will find a revolving grater, such as is used in the New York markets, figured in April, 1867. We cannot answer the question about conservatory, without knowing more definitely what is required.

Parasite on Nursery Stock.—"E. B. G.," Danville, N. Y. The vine on the pear stocks is a Dodder, or *Cuscuta*, too immature to determine. Please send another specimen in a paper box.

Basket Worms.—A number of correspondents have sent the leafy cases of the Basket or Drop-worm, which belong to the genus *Oiketis*. The female does not leave the nest, but dies there after depositing her eggs. The only remedy is hand picking.

Worms in Pots.—"Mrs. W. G. B.," Fort Howard, Wis. We never knew fine water, properly made, to hurt any plant. The water should be perfectly clear—not milky or cloudy—when applied. Another way of getting rid of the worms is just before repotting the plants to allow the earth to get rather dry. The worms will congregate for the sake of mutual moisture, and will usually be found all together in a ball.

Apple Trees Dying.—J. Inger, Iowa, has decaying apple trees.—Insects, heat, cold, old age, overbearing, unsuitable soil, and external injury, are among the causes of decay in apple trees. The dead limbs should be removed at once. Scrape the bark and apply strong soap-suds to destroy insects. Cultivate the ground to give them a new start, top-dressing with lime.

Whitening Wool on Sheepskins.—Several subscribers wish to know how to whiten the wool on tanned pelts. Who will tell?

Coppers in the Garden.—"O. W." Sulphate of Iron is sometimes used in solution to destroy slugs and other pests. It has been recommended as an application to diseased pear trees, but we have no evidence of its utility. It is useful as a deodorizer.

Coal Tar.—"O. W." This cannot be ranked among the fertilizers, and will not make a soap with potash.

Steamed Food for Cows.—"L. P. D.," Lansingburgh, N. Y. It is pretty well settled that steaming food for cows pays milkmen very well. A Massachusetts farmer gives his opinion, as the result of five years' experience, that he can winter his cows on steamed feed for one-third less expense than on dry feed, and get one-fourth more milk. Whether it will pay a farmer who keeps his cows dry in the winter to steam hay and meal is another question. But it is necessary to keep cows dry?

Autumn Leaves.—The leaves of our forest trees are so beautiful when they take on their varied autumnal tints that many have a desire to preserve them. Several letters have been sent asking for the method of treating the leaves in order to best preserve their colors. The subject was referred to a lady whose taste and skill in such matters is well known among her friends, and the following was received, which, as it came too late to go in the Household Department, is presented here: "Gather the leaves as soon as they begin to change color, as they then retain their bright hues longest and best. Medium and small leaves are most suitable for wreaths, pictures, and crosses; a few larger ones are desirable for leaf bouquets, fine sprays of tiny ones for that purpose being

highly prized. To dry the leaves use old periodicals, that have been stitched together, as they are smoother than folded newspapers and somewhat like them in texture. Any book of soft paper will do. Begin to place in the leaves at the end of the book, but not too close on a page. When one page is filled, turn over five or six, and continue in this manner through the book; then put it in a cool, dry place with a heavy weight upon it, as it is very essential to make them as smooth as possible. In one or two days another book will be needed into which to change the leaves. The first can be left open to dry, to be used again. In about a week the moisture will be extracted so that they can be placed in any book to remain until needed. I rarely work with mine under a month, to insure their being thoroughly dry. For all our leaves *not posted* on paper we use boiled lincseed oil, rubbing it on with a flannel rag, just enough to give a rich gloss. Keep the leaves spread out for a few days after oiling. For mucilage, to paste leaves upon Bristol board, use two parts gum Arabic and one of sugar. When the wreaths or groups are pasted on, press them between books until smooth and dry, and then apply carefully, with a small brush, one or two coats of copal or white varnish. For wreaths, cut a circular piece from stiff paper of the size and width required, sew a piece of steel hoop around the back to keep it from warping, and add a loop at the top to hang up by. Then begin at the top, arrange and sew on small leaves, increasing the size as you near the bottom. When one half is covered, begin at the top again and make the other side in the same way, and finish with the most brilliant leaves. The oval is another form that we use. Hanging against a light wall they look very bright through the winter, and retain their beauties until June. Lamp-shades, ornamented with leaves, are something new, and very beautiful as well as useful. Cut six pieces like the pattern in the engraving, in perforated Bristol board. They should be 6½ in. long, 5½ in. wide at the bottom, and 3½ in. at the top. Arrange a group of oiled leaves, flowers, or small ferns, on each piece—tacking them on very slightly; then line the back with white tissue paper, and cover the leaves with taffetas or lace; bind around the edges of the pieces with narrow brown or crimson ribbon, and sew them together."

Superabundant is an awkward word that the English have invented to express what their potatoes have been doing in the hot and dry weather of the past season. J. Jenks, Wright Co., Minn., has sent us specimens of "superabundant" potatoes, and others have complained of "superabundant." Discarding big words, the trouble is this: The growth of the tuber is arrested by drought or other cause, and trijumps when only partly grown. If a season of growth follows after the tuber is so far mature that it cannot increase in size, the new growth manifests itself in branches, most frequently we see small tubers produced at the eyes of the large one, and sometimes, as in Mr. Jenks' case, the growth is

almost that of a perfectly ripe potato recently planted. Sprouts or stems are thrown off, together with some that are a compromise between an above ground stem and a tuber. This is not peculiar to any variety, and entirely depends upon those conditions which favor or retard a healthy growth of vines or tops.

Early Rose Potato.—From all the reports we have seen, this is one of the new things that have come up to the representations made in their behalf. When Mr. Hefron first made it public he claimed it to be ten days earlier than the Early Goodrich and a great deal better bearer. That a strong desire was felt on the part of growers for a first class early potato was shown by the readiness with which the Early Rose was taken up at an unprecedented high price. We have had a number of accounts of its prolific character and its excellence, and of these we give two extremes, Canada and New Jersey. J. H. Foster, Kirkwood, N. J., planted it with two other early sorts, and gives the following as the proportionate yield: Buckeye 7½, Early Goodrich 9, Early Rose 18. The estimated yield per acre was Early Rose 378, Early Goodrich 192, and Buckeye 181 bushels. John Warcup, in Canada, laid 450 30 min. gives the following: "May 9th, I had 1 lb. of Early Rose potatoes by mail from B. K. Bliss & Sons, for which I paid a dollar. The package of one pound contained five medium sized potatoes, which when cut into single eyes made 65 sets, which were planted two inches apart in rows. May 28th they were mostly all up. They continued to grow, and maintained a deep glossy green foliage through all the very severe drought of the season. Aug. 15th the potatoes were dug, very ripe, skin red, and remarkably firm and russetty. The produce was 21½ lbs. May 9th, I planted also, with same treatment, one pound of one of our own favorite sorts. These came up several days later than the Early Rose, and gave a produce of only 11 lbs. with a much greater proportion of unmarketable potatoes. The Early Rose would have furnished good sized tubers for market very early, but our object being to ripen them, we let them all remain till thoroughly hardened." We have information from several quarters that unprincipled dealers sent out other varieties as Early Rose. Parties, in purchasing the Early Rose, or any other variety, should be sure and get their seed from reliable growers only.

Spots on Rose Leaves.—"A. W., Wythe Co., Va., sends some rose-leaves ruined by brown swollen blotches. The microscope shows the presence of some minute fungus, which has lived upon and destroyed the tissues of the leaves. The treatment of cases of this kind is yet but little understood. Good culture, to produce a vigorous plant, will help. Sulphur destroys one small fungus, that of mildew, and it would be worth while to try it on this. It should be freely sprinkled on the plants at the very first appearance of the trouble.

The Greeley Strawberry Prize.—Never were good intentions the cause of so much dissatisfaction as those of Mr. Greeley. The awarding of his grape prize was the horticultural sensation of the day—or rather of three years—and as it was awarded first one way and then another, it succeeded in making more trouble than is usually to be had for \$100. As to the strawberry prize, this was offered for a fruit that should have all the good characters of the Wilson and be of better quality. At the strawberry show of the American Institute some plants were entered for this premium, some in pots, others in tubs. Some were too late and others too early, and some had persistent advocates who would dog the committee at every corner. No committee with a shade of a conscience would award a premium which would almost revolutionize strawberry growing on such materials. They properly named the most promising kinds entered for the premium, and recommended that a committee be appointed to see the fruit another year and make a decision. We do not learn that any steps were taken this year towards awarding the prize. The whole matter yet remains where Mr. Greeley left it, in the hands of the American Institute. This brief statement, which we believe covers the whole case, is made to avoid answering any more letters in relation to the subject, as well as to place Mr. Greeley in the proper light. He is ready to pay over the premium whenever the Institute awards it, but he has nothing at all to do with the decision.

Transplanting Large Pear Trees.—"E. N. C., Cambridge City, Ind., wishes to know the best time to transplant pear trees 6 to 10 years old. Should prefer to do it in spring. The better way, if the trees are large, is to prepare them a year beforehand. Dig a circular trench, and cut off all the roots that extend too far to be readily removed. A mass of fibrous roots will form, and the shock of removal will be much lessened.

The Tomato Question.—Canada Experience.—J. Warcup, of La Prairie, gives among

other interesting garden memoranda the following experience with tomatoes: "I have tried Keyes' Early, Cedar Hill, Early York, and Tilden's. They were all cultivated alike; sown in moderate heat, March 23d, replanted in the bed May 2d, finally planted out June 10th. Keyes' began to ripen a week the earliest, Cedar Hill and York came next, and Tilden's, a very little later. Early York I shall discard on account of its roughness and want of attractive appearance. With respect to the comparative value of the three sorts, Keyes' is decidedly the earliest, of handsome shape, and very prolific. Cedar Hill, a little larger, fine form, abundantly prolific, very valuable. Tilden's has done finely, and ripened its large, beautiful fruit very satisfactorily, this season. The three kinds are all desirable and worth continuing."

Trouble with Arbor Vitæ.—"C. M. B." says that one of his trees is injured and dying; the stem is covered with a white substance and looks as if one had sifted meal over it.—If it is a woolly aphid, tobacco water will kill it; if a scale insect, as seems most likely, try hot water—water not quite boiling hot. If the tree is badly injured, dig it up and put in a new one, taking care that the new comer is not infested when planted.

Arbor Vitæ Seeds.—"H. W. L., Hamilton, N. J. These ripen in the fall, and should be sown at once; if kept until spring they are apt to remain in the ground a year before they germinate. As the young plants will need shading, it is well to prepare a bed in a frame of boards; the soil should be light and rich, but no fresh manure must be added. If the soil is not naturally open and light, add sand. Do not cover deeply. The seeds may be sown in boxes of earth and kept in a cool cellar. They must not be too wet, but only just slightly moist.

Another Mole Trap.—Mr. H. Sharer, Cloud Co., Kansas, upon seeing the illustration of a Holland Mole trap, given last month, sends a sketch and account of one in use in Germany and Switzerland, which he finds very effective for moles and gophers. It requires fewer pieces than the other, and its construction will be understood from the engraving, which shows the arrangement in perspective, the dotted lines indicating the run. Dig an excavation about a foot square and a little deeper than the run. Make a ball of earth, stick a notched stick into it and push the ball into the run. A spring pole has a catch fastened to it by a string; bend the pole down and hold it by placing one end of the catch in the notch in the stick and thrusting its other end slightly into the bank. A cord is attached to the spring pole, one end of which is made into a slip-noose. This noose is placed across the run in an opening made by thrusting a spade into the ground. After the noose is placed, cover the opening with earth, to prevent the entrance of light. The slightest pressure on the ball of earth by the mole or gopher loosens the stick, liberates the spring pole, and draws the noose. Mr. S. is in doubt whether moles do more harm than good, but is sure that the

gopher does mischief. Our gardeners would soon decide against the mole. It plays havoc with lawns and strawberry beds, and seems to have a special liking for bulbs of all kinds. A friend of ours who is raising the rarer lilies for sale was seriously damaged by the work of moles among his lily beds during the past season.

Caladium Seed.—"Will S., Warrensburg, Mo. By 'Caladium' we presume you mean the plant with a tuberous root, and enormous leaves, which is often planted out for ornament, and which is now called *Calceola esculenta*. It is propagated by division of the root, and may be had of most florists. It is not raised from seed. The root may be stored through the winter in a cellar or any place that will keep potatoes well.

Michigan Wheat Premiums.—Good examples are contagious, and following closely after the Judt Wheat Prizes, offered this year through the N. Y. State Agric'l Soc., we have the liberal offer by Moore, Foote & Co., of Detroit, of \$400 in premiums to be awarded to the Michigan State Agric'l Society. The prizes are \$350, \$100, and \$50, for the best, second and third best five acres of White Wheat sown in the fall of 1898 and harvested in 1899, to be exhibited at the State Fair of 1899. Competitors must be members of the State Society. For conditions address R. F. Johnston, Secretary, Detroit.

The First Cast-Ron Plover in America.—patented by Charles Nowbold in 1897, has recently been presented to the New York State Agricultural Society, by John Black of Mt. Holley, N. Y. The plow consists of share, land slide, sheath, and mould-board, and was all cast in one piece. The point was very soon broken and was never used afterward. The inventor spent about \$30,000 in perfecting and introducing his plow, and failed. A good idea is certain to win its way in the end.

Renovating Worn-out Soils.—"A. A. N." "What is the cheapest method of bringing up exhausted land?" In any climate where clover will flourish, this plant is undoubtedly the cheapest manure. If you can get a fair crop of clover to start with, your success is assured. This can be done in many cases by sowing two bushels of plaster to the acre. If this does not succeed, bone dust, Peruvian Guano, or fish scrap, in moderate quantities, certainly will. The clover may be eaten in when a little past full bloom, or be partially fed by cattle that remain on the field, and plowed in later. Two or three crops will prepare the way for grain.

Peas as a Field Crop.—"D. G. H.," Princeton, N. J. We know of no good reason why peas should not be more generally raised in the northern States. They are a very common crop in Canada, and from thirty to forty bushels are grown to the acre, on good soil. They are much used in feeding swine and sheep, and make pork and mutton of the best quality.

Onions and Rotation.—"S. L. W.," Southport, Conn.—"Why do onions succeed without rotation?" It is by no means certain that onions are an exception to the general rule that rotations are beneficial. They succeed better than most other crops without rotation, because they have much more manure, and much more thorough working. The Brothers Wells, of Wellersfield, raise onions upon a piece of ground that has been in that crop for the last eighty years. They manure every year at the rate of thirty cart-loads to the acre. The surface soil is a foot deep. In the spring, as soon as the frost is out of the ground, they snail to the depth of two feet, and the crop is cultivated so often that no weeds are allowed to go to seed. The product is about 600 bushels to the acre in good seasons. If they could afford to raise some other crop in alternate years, it is quite possible they might get a larger yield of onions. If other crops had as much manure, and the annual subsoiling and thorough cultivation, they could be more frequently repeated. Rotation is valuable in its place, but not indispensable where a high-priced crop, like onions, demands high manuring and thorough working.

Good Farm Help.—"A. M. P.," Springfield, N. J.—"The difficulties of securing faithful service lie quite as much at the door of the landholder as of the laborer. If the farmer pursues the penny-wise policy of hiring for only a few weeks or months in summer, he cannot expect to find men waiting his wishes; or, if he find them, they will generally be idlers waiting for something to turn up. The true policy is to hire by the year. This gives the choice of the market, and good services."

Foremen—How to Get Places.—"S. D.," Toronto, C. W., asks the following questions: 1. Where can a competent foreman find employment? 2. How can he find it? 3. Where can he best improve himself as a farmer? A foreman, willing to work, as well as to direct labor, is always in demand at the opening of the year. The best market for such service is usually in the suburbs of cities and villages, at the country seats of gentlemen. The best way to find a place is to advertise. If a foreman wishes to study the science of agriculture he could spend a year or more very profitably at an agricultural college.

Ice-houses.—One twelve feet square is large enough for a common family, and will keep ice so that there will be plenty to spare. The house should be double walled, with a 10-inch space between the weather boarding and the plank lining, filled with dry sawdust, tan-bark, shavings, or some other similar loose material well packed down. There should be not the least chance for water

to stand, nor for air to circulate at the bottom. The ice should be laid upon an open floor, covered at least a foot thick with straw. A gentleman of our acquaintance first covers the floor with a layer of straw, then lays small bundles with two or three tight bands close all over, then covers these with a good layer of straw, on which goes the ice. The same person uses wheat chaff to fill in around the sides between the ice and the walls, and to cover the ice with. If there be enough chaff, neither straw nor sawdust need be used to pack around or cover the mass of ice. There should be double doors in the gable end, and sufficient ventilation to secure a chance of air, and prevent that close, damp, warm atmosphere which is often perceived in unventilated ice-houses, and which is the cause of rapid thawing and loss of ice.

A Prairie Ice-house.—Make a platform of rails close to a big dry straw heap, cover it a foot deep with straw; set crocheted poles, and make a shed with rails, covering it with straw enough to protect it from the weather. Pack the ice in a circle 12 feet in diameter, and build the pile 8 feet high, very close and snug; then pack it all around with straw, doing it slowly and thoroughly, and finally cover it with 6 or 8 feet of straw on all sides. Such a stack will keep ice well.

Cheap Lands at the East.—"E. T.," N. Y. We refer you to April *Agriculturist*, page 137. The best way is to visit the districts indicated, see the cheap lands, and judge of them yourself.

Cotton Seed Meal for Hogs and Horses.—Sears Atwood.—"We have never used cotton seed meal for feeding horses, but would not hesitate to try it, beginning with small quantities, and feeding it with other provender. Hogs do well upon it, we believe, fed a pound or two a day."

Obstruction in Tile Drains.—B. Dale, Cayuga County. It is generally quite easy to detect the point of obstruction, by the wet appearance of the soil above. The most frequent cause of obstruction in well laid drains is the intrusion of the roots of trees. The remedy is to remove the trees, or to sink the drains.

Spent Tan-bark.—S. G. Perry, Carroll Co., O. The bark contains usually a larger percentage of ashes than any other portion of the plant, and hence is a valuable addition to any soil. Your great heap of old, well-rotted tan-bark would doubtless be serviceable, on either plowed or grass land, as a top-dressing or plowed under, and it would be good also in a compost heap. It might be worth while to use such portion as is dry as an absorbent in the stable.

To Dealers—Last Time of Asking. Will those seedsmen, dealers in implements, stock, trees, in short, any agricultural or horticultural matters whatever—who wish their names to appear in our ANNUALS, please send their business cards or catalogues at once!

Keeping Over Old Hay.—"R. F. B.," Litchfield County. If old hay is well stacked, or in the barn, it is worth about as much the second year as the first. It is a good plan to keep over a few stacks to meet the emergency of a short hay crop. It is a poor plan to buy hay when it bears the highest price. The most thrifty farmers have hay to sell in these years of short grass crops, and the extra price pays very well for keeping.

"The Crack Shot" is the title of a very neat volume by Edward C. Barker as a guide to young riflemen in the use of the rifle. The subject is pleasant and thoroughly treated, a free use being made of engravings in explaining the principles involved in the use of this implement. The chapters on American and European breechloaders are full, and well illustrated with pictures and sectional views of the arms. The volume contains 340 duodecimo pages, and is published by W. A. Townsend & Adams.

What is the Difference between a Horse-hoe and a Cultivator?—These terms are often used indiscriminately. We have known an agricultural society to award a premium one year to an implement as the best cultivator and the next year to the same implement as the best horse-hoe. It would be well, perhaps, to confine the term cultivator to implements used for cultivating the soil previous to sowing the seed, and horse-hoe to implements used for cultivating between the rows of growing plants.

What Missouri Wants.—"W. B. J.," writes: "We want more enterprising men to buy up and

improve our surplus lands, that can be had at a very low price. Missouri has a good variety of soil, well adapted to the culture of all kinds of produce. Wide and rich bottoms can be had at from \$5 to \$50 per acre, extended prairies from \$1.25 to \$50 per acre, according to improvements, and ridge, hill, and bluff land can be had for just what a man will please to give. Land is owned in large tracts of \$9 to 4,000 acres, and will have to be bought up by companies. We have some fine sheep and want more, and we want machines and factories to manufacture our wool to save double expense, first of shipping the wool East and then sending the cloth West. We have paid high prices for our sheep, and now we are worse off than if we did not have any, as we cannot get the wool carded, and cannot get any more for our fine wool than for the wool of our coarse woolled sheep. We have been humbugged enough; we want to improve our country and to show to the world that Missouri is one of the best States in the Union for all branches of business. Crops are good this year and fruit abundant. This fall or next spring will be a good time to emigrate. Montgomery and Callaway counties I can recommend. Come and see us, and bring along your machines."

Nebraska Lands.—The following comes from an "old subscriber" in Nebraska. Correspondents often ask about Western lands, and where they can get information concerning them. We give this as we may give others of similar character, to indicate a channel through which inquiry may be made, with the distinct understanding that while we have no reason to doubt the statements, we are in no way responsible for them.—Ens. "I feel that I shall benefit many of your moving readers by suggesting that they post themselves in regard to Nebraska, south of the Platte River. There is plenty of good government land yet to be had in places, and it is one of the best farming States in the Union. After a week's ride, I can say I never saw so much fine, rich, and good rolling land, and I had the pleasure of meeting with some parties who are forming a colony to settle on government land, and cooperate in all the expensive items incident to new country farming, such as implements, machinery, fencing, hedging, pasturing, herding, prairie breaking, schools, etc. To my mind such an opportunity seldom occurs to settle on government land, at government prices and terms, and be surrounded with so many of the elements of an old settlement. Your readers can post themselves by calling on or addressing Mr. E. J. Huse, care B. M. Davenport, Nebraska City, Nebraska."

Advice to a Novice in Farming.—"Etina," writes: "What part of the Union would you advise a young mechanic to go to, to commence farming? How much capital ought he to have? What kind of land ought he to buy? What kind of tools ought he to have to make a good living? In fact, how ought a novice to get into the business?" This is given as a specimen of many letters of similar purport. They are exceedingly unsatisfactory to answer, as we are sure the advice will be contrary to the wishes of the writer. We long ago learned that it was a thankless task to advise one against his inclinations. Our correspondent, who is quite unknown to us, will hardly like it if we tell him if he is so much of a novice that he does not know what tools he will need, that he had better not invest his capital in farming, and need not yet trouble himself about the parts of the Union. The best investment he can make is to hire himself out to some thrifty-going farmer for at least a year. He would probably earn something, but it would be better to give the work of a year for the instruction received than to start as a green hand. If he does not believe this is so, let him ask himself if he can take care of horses and cattle? Can he hitch up a team, or yoke a pair of oxen? Can he milk, cut down a tree, plow, harrow, mow, cradle, or thresh? Can he split rails, lay a stone wall, use a hoe—in short, do the many things that are necessary to be done on a farm? We would encourage young mechanics who wish to try farming, but would no more advise them to go into it without some previous knowledge than we would advise a farmer to take up a mechanical business without first learning the use of tools. If our young friend has made up his mind to be a farmer, as we hope he has, he will let no slight obstacle deter him. The way may be much smoothed by the course we have indicated, and much useless expense avoided.

Tanning Skins.—An old trapper gives the following process for tanning skins with the fur on. Take two parts each of alum and salt, and one part saltpeter, all well pulverized. When the flesh side of the skin has been cleaned of fatty and other adhering matter, sprinkle it freely, enough to make it white, with the mixture. Fold in the edges and roll up the skin. Let it remain for three or four days; then wash, first with clear water and then with soap and water. It should be pulled in various directions as it is drying, to make it soft and pliable.

The Number of Feet, Board Measure, in a Log.—An old lumberman gives us the following rule for ascertaining the number of feet in a round log. It is not absolutely accurate, but near enough for practical purposes: "Take off 4 inches for snags; then square half the diameter, and on a 12-foot log multiply by 3, on a 14-foot log by 3½, and on a 16-foot log by 4, etc." Thus, suppose you have a log 12 feet long and 24 inches in diameter: Deducting 4 inches for snags, leaves 20 inches. Square half the diameter $10 \times 10 = 100$ feet. Multiply by 3, $300 \times 20 = 6000$ feet. If the log is 14 feet, multiply by 3½ = 3500 feet; if 16 feet, multiply by 4 = 400 feet. If the log is 36 inches in diameter and 12 feet long it would contain 768 feet, $36 \times 20 = 720$. Thus $36 - 4 = 32$. Square the half, $16 \times 16 = 256 \times 3 = 768$.

Turning in Clover for Wheat.

"O. A.," Harrisonville, O., asks: "Will clover plowed under while in full bloom be sufficiently rotted by the last of August or first of September to bring to the surface as a preparation for wheat? In what way would you turn it under, to what depth, and with what plow? Clover turned under in full bloom is full of sap, and very soon disappears in the soil. Nothing of it would be left by the end of summer to hinder the plow or harrow. The proper depth to plow will depend a good deal upon the character of the surface and sub-soil, and the quantity of manure to be used. We always like to air an inch or two of the subsoil. In turning under clover, say six or eight inches deep, we should not bring it to the surface again in cross plowing for wheat. Any good soil plow will turn in clover, and if the plow clogs, it can be remedied by heavy chains fastened to the end of the beam and to the lower part of the right plow handle. The best farmers of some sections often feed off the bulk of their clover before plowing. They claim that the manure left upon the field by the cattle is worth nearly as much as if the whole clover were turned in, while they gain the pasturage."

Muck Deposit.

"W. W.," Burlington, Vt., asks: "I have an accumulation of vegetable matter, made by a spring running over a flat, causing weeds and grass to grow and rot. What is the best way to use it as a fertilizer? It can be used in a variety of ways to good advantage. 1. As an absorbent in barn-yards, stables, sties, and privies. 2. For composting with stable manure, three loads of the mould to one of manure, upon the ground where it will be wanted next spring. 3. For composting with lime or with ashes. 4. For spreading upon light sandy or gravelly soils as a top-dressing for grass, or to be plowed in for food crops. For any of these purposes it will be better to draw it out upon dry land and expose it to the frosts of one winter."

Bone Mill.—D. B. Sehold, N. J. If you have a bone mill that will grind twelve tons a week, that will go by horse or water power, and that you can sell for \$300, you will do well to put it in the market at once. We know of no mill suitable for this work that can be made for twice this sum. Hundreds of farmers would be glad to own such a mill if they could afford it. They can get bones cheap in the villages, but the trouble is in reducing them. The mill would sell well if advertised.

Distributing Manure in Pastures.

"C. T. S.," Richmond. "My sheep and cattle drop most of their manure near the gate where they lie at night. Is there any remedy?" The sheep can be managed by putting them in pens at night in different parts of the field. The cattle will change their place of rest by salting them in various parts of the pasture. A little extra feed frequently offered will draw them to almost any required spot, if it is dry. It is very desirable to have the manure as evenly distributed as possible.

Poultry Breeding In and In.

"B. H.," Jamaica, L. I. This practice is carefully avoided by the poultry men. Fowls of the same parentage should not be sold for the purpose of breeding together. The cocks should be changed every spring.

Roosts.—"L. L. G.," Bordentown, N. J. We are not aware that the rook has ever been brought to this country. The rooks are highly prized by British farmers for the protection they afford to their fields. They live largely upon larvae dug from among the roots of grass, and only plunder the grain fields when forced by hunger. The Mark Lane Express says in a recent number: "The experiment has been tried to destroy or banish these birds, but it has always been a cause of bitter regret, for the immense increase of the insect tribes that followed their absence inflicted more injury than the rooks themselves would have done. Such is the case at this very moment in France, where, owing to the war waged against these birds, the communes are paying for the

destruction of the cockchafers, which in myriads are ravaging the fields and woods." We have a great excess of insects in all the older parts of this country, owing no doubt mainly to the wanton destruction of our birds by amateur sportsmen. Insect depredators are among the worst enemies the farmer and fruit grower have to contend with, and we need a great increase of birds to keep them in check. The birds are easily kept within bounds, but the insects are too mighty for man. Literally he is "crushed before the moth."

Cutting Corn by the Roots.

Morrisson, N. J. This practice has been steadily gaining for the last twenty years, and this is one of the best tests of its economy. The grain is heavier than when the stalks are cut as in the old method; the labor is much less; the fodder, taken as a whole, is more valuable. If cut as soon as the corn is glazed, the whole stalk will be eaten when chaffed. It is highly prized by milkmen, and many consider it equal to the best upland hay for producing milk.

Lima Beans and Corn.

Lynn, Mass. Limas may be shelled when of a size fit for cooking and dried. They are to be soaked over night when used. Those that approach maturity had better be allowed to ripen. If you can afford to use them, considering the high price they bring as seed, try some pork and beans made with Limas. It is the old Yankee standard dish glorified.—Or, boil until tender and fry brown in butter. Sweet corn has been fully discussed in past months in the household columns.

The Cultivation of Sorghum.

"F. H.," Ludlow, Mass. "Does the Sorghum crop pay?" The cultivation of this crop made rapid progress during the war, on account of the high prices of sugar and molasses. It has probably gained a permanent foothold in the northern States, especially in the West, as a paying farm crop. Large quantities of syrup are made, which find a ready home market. The general impression is that the crop this year is a small one, but the Sorgho Journal claims that the quantity planted the present season is much greater than the last, though not quite equal to that of 1890. The crop falls frequently through poor seed, and those who save their own seed should be careful to guard it against frost. The seed may be gathered before it is fully mature, and if kept from frost, and thoroughly dried, it will vegetate much better than that which is frosted, and afterwards ripens upon the stalk.

Early Rose Potato-Premiums.

In another item will be found some account of the success of the Early Rose Potato. Since that was in type we have had abundant testimony from others, all of the same purport. In view of the great interest felt in this variety, the publishers have placed it upon the list of premiums, upon terms which will enable those who desire to make a trial of this remarkable potato to do so, with a very little effort expended in procuring subscribers for the *Agriculturist*.—See Premium Lists.

The New England Fair.

The Fair and Cattle Show of the New England Agricultural Society occurred the first week in September. The show of neat stock was magnificent, the best herds of each prominent breed being well represented. There was also competition enough to excite interest, and the decisions of the judges, though made with no little perplexity in some cases, met with general approval. No doubt mistakes were made, but on the whole, so far as we are aware, all went smoothly and pleasantly. It was, moreover, a very even show, each breed, Short-horns, Devons, Ayrshires, and Jerseys, being from several exhibitors, and most of the animals of marked excellence. The great Dutch breed (in color, spotted black and white, in size excelling the largest Short-horns, and in coarseness rivaling a post and rail fence, great feeders and great milkers) were a novelty to most spectators, and attracted much attention. The show of working oxen, usually the conspicuous feature of Connecticut fairs, was not large, but it was very fine, some of the best pairs and "strings" coming from other States. Mutton sheep were the great attraction of the small-cattle department, but some of the 400-pound Cotswold can hardly come under this designation. The breed was shown in large numbers, and of a quality we have never seen equalled. There were some good Southdowns, but the average was low, and Merinos were there with wrinkles and creases enough to have satisfied even a Hammond. The show of swine was unworthy of the Society, and a pair of Windsor Suffolks were all we remember as above mediocrity. A single exhibitor from New Haven redeemed the poultry show from utter failure, and his collection was excellent and instructive. The important feature of the horse show, and one which should be everywhere encouraged, was the exhibition of stallions with their progeny. The high-bred trotting

stallion "Ashland" was shown, with, we should judge, a score or more of his colts and fillies of all ages from four or five years old to yearlings, showing a very strong family likeness. There were an unusual number of fine breeding horses shown, among them some noble thoroughbred mares. The Implement Department was not very extensive, but literally filled with meritorious articles. There have been great improvements in horse-races. An invention applicable to all mowing machines enables the driver to lift the cutter bar quickly and easily with his foot, without using his hand. We noticed an admirable safety whiffletree trace hook, several good hay tedders, and one of them possibly good, and, if so, very cheap and handy, and a self-loading "rigging" for hay wagons, which we think will work. This will, with a man to tend it upon the ground, pitch on its own hay faster than two men can possibly take care of it on the load. A reversible plow upon a new principle, for use upon level land, struck us as very good. Two shares and mould boards are fitted upon one large plate which is the landside for both, and this is easily turned over the iron beam, and thus the implement becomes either a right or left-hand plow. In the Household Department there were many interesting things also. The New Haven carriage makers made a grand display, but not particularly agricultural. Fruits and vegetables were a meagre show—the only interesting article to us being the new grape "Emanuel," shown for the first time. The floral show was in one of the fine halls of the city, and was most admirable. The walls were hung with pictures of great excellence, chiefly landscape, and the sides and center of the halls were filled with choice flowers, bouquets, foliage plants, ferns, etc., of rare beauty, in great profusion, and tastefully arranged.

There is usually complaint at such gatherings, and some grumbling is expected, often justifiable and frequently not, but on this occasion there was the most obvious mismanagement on the part of the chief officers of the Society. In the first place, the Society had apparently sold itself out to a jockey club and turned its meeting into a horse race, with an agricultural attachment. The President tried weakly to give dignity to the agricultural part. In his great pavilion he maintained a solitary majesty, his tables being occupied by a few reporters who escaped from the jam of the race course for quiet. The show of vegetables and fruits was, as we have said, very meagre. We heard of exhibitors in the department who were turned away because their contributions were judged insufficient to give them admission, though competing for the published prizes. The grounds were occupied in some of the most conspicuous places by side shows of fat women, learned pigs, and all sorts of monstrosities. Spirits were sold freely, and the accompaniments of a race-course bar, drunkenness, profanity, and noisy rivalry, were thrust before the refined and decorous parties of city and country men and women, lads and lasses, who came to the show. Here, too, was the open sale of "racing pools" at auction. Pool selling is regarded as the very worst form of horse-race gambling, and it is a burning disgrace to the officers of the N. E. Ag'l. Society that they allowed it. If this is the Boston way of managing a Society of this kind, it is high time there was a change. These associations are not such as the wives, daughters, and sons of New England farmers should be accustomed to.

Fitting for the Nursery Business.

"D. K. M.," Magnolia, (no State) says: "I wish to fit myself for the nursery business; please inform me what books I had better read." Reading will be a good preparation to enable one to learn the business intelligently. Barry's Fruit Garden, Warder's Pomology, Fuller's Small Fruit Cultivist, Thomas' American Fruit Cultivist, Hoopes' Evergreens, and Fuller and Mohr on the Grapes, all contain much that would be a great help to a beginner. We assume that of course Mr. M. intends to learn the practice with some competent nurseryman.

Gas Lime.

"A. N.," Nashua, N. H. This article is to be used with caution, as it contains deleterious matters with the ammonia and gypsum, which are useful. It may be spread upon mowing or pasture land, at the rate of three tons to the acre, with good effects upon the subsequent crop. At the rate of eight tons to the acre it kills vegetation. It might be used to eradicate weeds in very foul land, and in walks.

Farmers' Clubs.

"G. N. T.," Nicholson, Pa., asks: "Can you tell us how these clubs are organized and managed? The less machinery you have about them, the better. Meet around at the farmers' houses, if there is no better place, appoint a chairman for the meeting, and a secretary for a longer time, three months or a year, propose a subject for discussion, and let each man give his experience and ask his questions. The more familiar the meetings can be made, the better. A dozen farmers meeting once a fortnight, for discussion and to inspect stock, crops, and buildings, could not fail to help one another to be better farmers and housekeepers."

The Department of Agriculture.

"F. B. W." asks us to advise our readers to petition Congress to abolish the Department of Agriculture. Not yet, Mr. W. The present Commissioner is quite desirous of working for the good of farmers, if they will through their associations indicate what they would have him to do. He had not been long in place before he discharged a lot of nobodies and shut up the seed-shop, for which he deserves much credit. The only charge our correspondent makes against the Department is that the publications are expensive and are unequally distributed. The reports are really accessible to every farmer, as all Agricultural Societies can have them, and every farmer should be a member of such an organization. The sum appropriated to the Department is not large, and we do not deem its abolishment demanded on the score of economy. The promptness with which the Commissioner took steps to have the Texas cattle disease investigated shows that he intends to work for the farming interest.

American Hay in England.

Owing to the extreme drought, hay is very scarce and high in England, and some of our enterprising merchants have sent over a considerable number of bales from this country. Should there be no prejudice against American hay, and should it command the same price as the English article, there can be no doubt that with the present premium on gold, hay would be sent in large quantities and with considerable profit to the shippers. The subject has attracted considerable attention, and the most extravagant statements have been made in regard to the effect it would have on the price of our hay crop. It is doubtful whether the anticipation of extreme high prices will be realized. One of our foreign exchanges notices the sale by auction at Liverpool of foreign-grown hay. It says: "The imports from Belgium realized from £5 15s. to £6 per ton, whilst those from the United States sold at from £4 10s. to £5 10s. On the same occasion English-grown was purchased at £7 per ton." Reckoning seven dollars to the pound, English hay is worth \$49 per ton, and American hay \$31.50 to \$35.50 per ton, say an average of \$33 per ton,—a difference of \$14 per ton in favor of English hay. Those who have based their calculations thereon on the price of English hay are likely to be disappointed. The Irish Farmers' Gazette obtained samples of the hay, and says: "The Belgian hay seems to be fully equal to the English sample, but decidedly inferior to a well saved specimen of Irish hay with which we compared it. The American hay is extremely coarse—more like dried rushes than the produce of a meadow. One specimen is very inferior, and is certainly not equal in feeding value to good oat straw. If the Americans can send us a better we need not apprehend much serious competition from them in the matter of fodder." We can hardly believe that those engaged in this business could have committed the folly of sending an inferior article. It is more probable that good Timothy hay was sent, and those acquainted with English meadow hay can easily understand how coarse it would appear in comparison. If there is any reluctance to be placed on the analyses which have been made, Timothy is the most nutritious of all grasses, and we should be surprised if the English horses do not pronounce a different verdict from that of the Farmers' Gazette. We understand that the hay has been submitted to chemical analysis, and we shall know more about it in a few weeks.

The Importance of Selecting Good Cattle for Fattening in Winter.

In a paper on stall-feeding read before the Limerick Farmers' Club, by Mr. E. L. Hunt, he said: "We often hear that stall-feeding does not pay, but if you only saw the description of cattle that those farmers try to fatten, you would not be surprised that they find the speculation a losing one. I am of opinion that the great question of profit or loss is generally decided the day the selection is made of the beasts intended for fattening; also the condition they are in when tied up. The proper time for doing so is the end of October, or early in November. Care must be taken to have them all housed before the wet or cold weather tells on them.—There can be no doubt of the importance of paying great attention to the kind of cattle intended for fattening. The neglect of this is one reason why farmers think that if an animal is allowed a liberal allowance of hay and meal, it will soon 'eat its head off.' With a well-bred grade Short-horn or Devon, the result would be very different.

Winter Fallows.

The object of summer-fallowing land is—1st, To exhaust it; 2d, To give it rest; and 3d, To enrich it. It is unnecessary to say anything on the first point. We all understand why and how summer-fallowing cleans land;

but we may not have as clear ideas of the advantages of allowing it to rest. The growth and removal of plants necessarily impoverish the soil. Stopping plants from growing by continually stirring the land prevents this exhaustion, but it is equally true that land rests when allowed to remain in pasture, and all the grass which grows is returned to it in the droppings of the animals. Strictly speaking, therefore, the real object of a summer fallow is to clean the land and to enrich it. Pulverizing the soil and exposing the particles to the atmosphere decomposes the organic matter and disintegrates the mineral matter, and thus renders available a certain quantity of plant-food, which before lay inert and unavailable.

The old-fashioned system of summer-fallowing is now seldom practiced in this country or in Europe; but in England, on the heavy lands, the "bean fallow," and on the light lands a turnip fallow have taken its place. In this country there are a few farmers who still plow their land three times in summer-fallowing for wheat, but of late years nearly all our summer fallows are plowed but once—say in June or July—and all that is afterwards done is to keep the surface clean by the use of the cultivator, etc.

Our present object is not to advocate or reprobate this system, but we can see no reason why a winter fallow will not do nearly or quite as much good as such a summer fallow. If the land was plowed early in the fall, many weeds would start, and could be destroyed by the use of the cultivator before winter sets in, or at all events they would be killed by a second plowing in the spring. We do not see, however, why land that is plowed in September or even the first of October could not be again plowed, should the weather permit, the latter part of November or often in December. It would then lie up rough and exposed to the ameliorating effects of the frost.

In England, farmers appreciate a severe frost in making the land "turn up" better in the spring. Here, in the Northern and Eastern States at least, we are always sure of cold sufficient to freeze the soil, and it is evident that but few farmers avail themselves of the effect of frost in disintegrating and mellowing their arable land. If they did, winter fallows would be more common.

Cider Making.

Portable cider-mills that can be worked by hand are very convenient and useful, when there are but few cider-apples to be worked up. It often happens that a farmer has a few bushels of apples that will not keep till the time of making the main crop into cider, and in this case a portable cider-mill will enable him to use them to advantage; but when there are several hundred bushels of apples ready at one time, the old-fashioned custom of taking a load of apples and straw to the nearest cider-mill is the pleasanter, and we believe the more profitable plan. It is a kind of holiday for the boys. The apples are allowed to hang on the tree as long as the wind and frosty nights will let them. The riper they are, the better the cider. They are picked up and placed in a large heap, either in the orchard or at the cider-mill, and are allowed to lie a few days to complete the ripening process, in which the starch is converted into sugar. They are then rasped or ground into pulp. If the weather is cool and the apples not quite ripe, it is better to let the pulp remain in the vat a few days before pressing out the juice. This gives the cider a higher color, makes it sweeter, and of better flavor. The process of pressing is simple, but requires some skill. Four boards about six inches wide are nailed together in a square, the size it is desired to make the cheese, say from four to five feet. This is placed on the bottom of the press, and a little clean rye or wheat straw, pulled out straight into bundles, is put inside with the ends extending about a foot all around. The pulp is then put into this rim forming a layer about six inches thick; the straw is then turned on it, and a little pulp placed on the straw to keep it down. The rim is then lifted and a stick is placed at each corner on the layer of pulp for the rim to rest on; some more straw is then placed all around, and another layer of pulp added and the straw turned over it as before. This process is repeated until the cheese is as large as desired, using say from seventy-five to a hundred bushels of apples.

The cider will commence to flow at once, and it is better to let the cheese settle down somewhat before turning the screw. If pressed too much at first, the pulp may burst out at the sides. The cheese is generally allowed to remain under the press all night, and before leaving in the evening, the screw is turned as tight as possible. In the morning additional pressure is given, and when the cider has ceased to flow, the screw is turned back, the boards taken off, and the corners of the cheese are cut off with a hay-knife and the pomace laid on the top. The pressure is again applied, and the cider will flow freely. As soon as it ceases, remove the pressure and cut off four or five inches of pomace from the sides of the cheese, place it on top, and apply the pressure again as long as any cider will flow. Eight bushels of good apples will

make a barrel of cider. The cider is usually put in barrels at once and sold while sweet.

Strictly speaking, we suppose the sweet juice of the apple is not clear, any more than the sweet juice of the grape is wine. It is converted into cider by fermentation. Those who prefer sweet cider resort to various methods for arresting this process, such as putting a handful of powdered clay into each barrel, or two or three pounds of well-burned charcoal. Others add a little mustard seed. Sometimes a few gallons of cider are placed in the barrel, and then a rag dipped in brimstone is attached to a long tapering bung; this is ignited and the bung loosely inserted. After the brimstone is consumed, the barrel is rolled until the cider has absorbed the sulphurous acid gas. The barrel is then filled up with cider. The sulphurous acid gas acting on the albuminous matter in the cider arrests fermentation. The objection to this method is that if too much gas is absorbed, it may prove unpleasant if not injurious. To obviate this, sulphite of lime is now used, which has the property of checking fermentation. We have tasted cider preserved in this way that was excellent, and we have also tasted some that was execrable. It is not an easy matter to keep cider sweet and pure for any length of time, especially if the weather is warm. If the cider is not made until just before winter sets in, and can afterwards be kept at or near the freezing point, it will remain sweet and excellent.

To make good fermented cider that will keep a year or more without turning too sour to be used for anything but vinegar is not a difficult matter. The first thing is to exclude all decayed fruit, but it should be quite ripe. Not a drop of water should be used in the process of manufacture. The sweeter the juice, the stronger the cider, and the better it will keep. Put the barrel immediately in a cool cellar—the cooler the better. The fermentation may go on slowly or rapidly, practice differing in this respect. In the former case the liquid is treated in all respects like wine. The cask has a bung in which is fixed air-tight a tin tube bent at right angles, or a piece of India-rubber tube. The free end of the tube in either case dips into a vessel of water. This arrangement allows the gases liberated in fermentation to pass out, and the end of the tube being covered with water, air cannot pass in. The bubbling of the gas through the water shows how the fermentation is progressing. When this has ceased, the cider is racked off into clean casks, which are to be full and bunged tightly. The following treatment is communicated by an English friend, which he assures us is attended with good results. Most readers would probably prefer their cider and beefsteak separate.

"Put into the barrel of cider five or six pounds of loaf sugar, and a pound of raw, lean beefsteak. Let the bung be open; keep the barrel full, so that, as fermentation takes place, the scum thrown to the surface may run off through the bung. Some cider should be reserved to be added every day or so, to supply the waste of fermentation. When all the scum is thus worked off, bung up the barrel tightly and place a few handfuls of wet sand on the bung, pressed firmly to exclude the air."

Seeding with Weeds.

Cleanness of the soil depends more upon the treatment which cultivated crops receive in the latter part of the summer, than upon any thing else. Foul land is one of the great evils of our system of farming. It not only greatly increases the expense of cultivation, and diminishes the crops, but it gives us foul grain and grass seeds, and thus the evil is perpetuated. It is easy to keep Indian corn and all the larger seeds clean, but it is almost impossible to get grass seed clean by any other process than clean cultivation, while the land is under the plow. Whatever grows in the meadow is cut with the grass, and the seeds are hopelessly mixed. Much of the grain that is sold for seeding has cluss or other foul stuff in it, and nothing is more common than to find daisies or white weed, dock and thistles, mixed in with the timothy, red top, and clover that we buy at the stores for pure seed. Such sales are a fraud upon the public, whether the man who raises the seed designs it or not. Few farmers have the means of detecting the cheat until the weeds come up, and bloom with the grasses in their meadows. Then it is quite manifest that "an enemy hath done this"; and he is none the less an enemy because he bore his neighbor no personal ill will. It is a sad sight in riding through the country to see so

many plants out of place, and so very few meadows and pastures producing grass only. Even upon the virgin soils of the West, recently reclaimed from the forest, or the prairie, it is astonishing to see the rank growth of weeds. Their diminishing wheat crops are owing quite as much to the presence of these weeds in the stubble, as to the loss of fertility in the soil, or to the changing seasons. There are few farmers who do not indirectly pay a heavier tax to weeds than to the government. We insist, then, upon absolute clean tillage all through dog days, as the only economy. We have no doubt that the extra cultivation required will be paid for in the extra yield of corn, and in all the root crops, except potatoes. This crop, fortunately, is not injured by early lifting, and as soon as dug, a clean sweep should be made of the weeds. If green, they can be turned under, and add to the riches of the soil. If ripe, burn them.

How Muck and its Composts Help the Soil.

In our last issue we noticed some of the methods of composting muck and peat and of preparing them for fertilizers. We now point out some of the ways in which they benefit the soil. They add a large mass of organic matter directly to growing plants, and supply their wants. These peat swamps are the sepulchres of dead plants, containing most of the elements of our cultivated crops. Composting puts this organic matter in a condition to be used. An analysis shows that peat contains nearly the same elements as cow dung. All our hard-cropped fields in the older States need this vegetable matter. It is especially valuable upon sandy and gravelly loams, and if we add it in large quantities enough we can turn a barren sand into a fertile field. Astonishing results are shown from the application of these composts to thin, hungry soils. They are largely made up of carbon, and their decay in the soil furnishes carbonic acid gas, both to the roots of plants and to their leaves. The great luxuriance of crops upon drained swamps and fresh clearings is due mainly to the abundant supply of this gas, furnished by decaying vegetable matter. In all cultivated lands the carbon in the soil is steadily wasting by the removal of the crops, and it must be restored or the land will not pay for cultivating. But peat contains nitrogen in considerable quantities, which furnishes to plants nitric acid and ammonia, the most costly elements in all fertilizers. The average amount of nitrogen found in the thirty samples of peat analyzed by Professor Johnson for the Connecticut State Agricultural Society was $1\frac{1}{2}$ per cent of the air-dried substance, or more than three times the quantity usually found in stable or yard manure. When the peat is weathered and composted and distributed in the soil, this nitrogen furnishes ammonia to plants, like other nitrogenous fertilizers. A ton of sun-dried peat, according to the estimate of the Professor, contains thirty pounds of nitrogen, equivalent to thirty-six pounds of ammonia, worth, at twenty cents a pound, \$7.20 a ton. This may not be all available for plants the first season, but it is so much plant food stored away in the soil, certain to be wanted in due time. It is as really money to the farmer as the nitrogen which he puts into the soil in yard manure and Peruvian guano. There is also an incidental benefit from the free use of muck compost too often overlooked. It enables the soil to appropriate the free nitrogen of the air. This is oxidized in the pores of the

soil to nitric acid, and thus the farmer's crops are daily dressed with the most costly of all fertilizers. The inorganic elements of peat are also valuable. The ashes have considerable quantities of lime and sulphuric acid, and magnesia, phosphoric acid, potash, and soda in less amount. These are worth as much as the same elements furnished in other manures.

Besides the plant food which is furnished directly by the peat, it helps the soil in other ways. It absorbs water, and holds it like a sponge for a long time. This property of peat makes it exceedingly valuable for thin, sandy, and gravelly lands. These lands are said to be leachy, from the well-known fact that manures do not benefit them much after the first season. But the escape of the valuable properties of the manure is into the air rather than into the earth, because there is not vegetable matter enough in the soil to retain them. It is of great value to dress these lands heavily with peat composts. They hold moisture much better to guard them against drought, and they retain the ammonia furnished by other manures. So many and important are the benefits of peat that every farmer who has bogs ought to ascertain their quality and spend money freely in making composts. Very often they are the cheapest means of enriching the farm and making it pay large dividends.

What to Do with the Sheep.

While good, fat sheep still command fair prices, poor, inferior ones can hardly be given away. During the past month such sheep have sold in Albany, and even in New York, at from \$1.25 to \$1.50 per head, and at Pittsburg and other interior markets, whole lots have been disposed of at 50 cents apiece. At the same markets fat pigs sold for eleven cents per pound live weight. In other words, four pounds of pork is worth more than a whole carcass of mutton, and the pelt thrown in. Not only in our large cities, but also in the country, meat is scarce, and commands high prices. Good fat mutton even, is by no means cheap. It is only the thin, half-starved sheep that are so low. It is not necessary to discuss the causes which have produced this state of things. They ought to teach us a lesson which we are slow to learn, that it is never well to rush into one kind of stock to the exclusion of all others, and then to half starve and otherwise neglect it when it proves less profitable than we anticipated. Those farmers who have taken good care of their flocks can still dispose of them to vastly better advantage than those who have neglected them. There is no profit in keeping any kind of stock unless it is kept well. There are those who think the mutton breeds of sheep more profitable than the Merino, and just now the incipient symptoms of a long-wool mania are manifesting themselves. It is simply a reaction from the American-merino sheep fever. It is clear to us that farmers who have sold their merino sheep for fifty cents a head would have done no better if they had had the English breeds. In fact, it may well be questioned whether they would have done as well, for the Cotswolds, Leicesters, Southdowns, or their grades will not endure neglect or starvation as well as our little, active, hardy Merinos. The trouble is not with the breed, but in the men.

The question recurs, What shall we do with the sheep? Stock of some kind we must keep. Butter, cheese, and beef, are very high, while wool is low, and many farmers are selling their

sheep at low figures, and buying cows at high prices. Those who propose going into dairying, with little experience, should count the cost. They have feeding racks, troughs, sheds or barns adapted for wintering sheep; but how is it with cows or cattle? They will probably need additional buildings, or will have to alter those they have, and it will take a pretty large flock of sheep at present prices to erect even a small cow stable. We do not anticipate any material reduction in the demand for American cheese abroad, while the home consumption will undoubtedly increase. Still, it is hardly safe to base our calculations on the present high prices of cheese and butter. The great drought in England—the worst that has been known since 1826—has increased the demand for American cheese, while the introduction of cheese factories into sections which have hitherto produced only butter, combined with scanty pasturage, will account for the comparative scarcity and high price of butter. It is not probable that a pound of poor butter will long continue to bring more than a pound of fine wool.

On most farms manure is a necessity, and there is no economical way of obtaining it in the interior without keeping stock. Owing to the high price of wheat, barley, oats, and corn, many farmers are determined to sow all their available land to grain. The diminished yield soon shows them their error. Disastrous as have been the effects of the sheep fever, the grain-growing mania will be even more injurious. It will curtail the profits of the farm, and leave the land in an impoverished condition, from which it will take many years to recover. We have, therefore, no alternative but to keep sheep or cattle. And our conviction is, that for the next ten years sheep will pay as well as any other kind of stock. If we had cattle we would keep them, and if we had sheep, we certainly would not sell them at present prices.

It is not easy to tell what it is best to do with such poor sheep as will not sell for more than fifty cents apiece. To try to fatten this winter would be throwing money away. If they are sound, healthy sheep, the better way probably would be to winter them on coarse fodder, with grain enough to keep them from growing thinner than they are now. The wool will pay the expense of wintering, and leave us the manure for profit. Next summer give them good pasture, and turn them off for mutton as soon as they are in good condition.

Sheep that are now fat bring a comparatively fair price. They may either be disposed of now, or fed liberally till mid-winter. By that time the thousands and tens of thousands of poor sheep that are glutting the markets will be disposed of, and there is a reasonable prospect that good mutton will command good prices.

In regard to the flock of ewes, it depends entirely on circumstances whether it is better to cross them with a Southdown or Leicester, or some other mutton breed, or to confine the flock simply to the production of fine wool. For the last few years long woolled crosses have been quite profitable. The wool has been in demand for combing purposes, and the mutton has commanded a ready sale. But of course it is useless to expect any breed or cross to produce a good fleece and a heavy carcass without liberal feeding. Those who are prepared to give extra food and attention to their flocks would do better to keep mutton sheep. If large flocks are kept, and it is necessary to put them on short commons, a well-bred, dry fleeced Merino would be the most profitable.

Fig. 1.—INLET ON CHESAPEAKE BAY.

Duck Shooting.

In October the various species of ducks arrive from the North, and congregate in the bays along the coast, where they find their favorite feeding grounds. Chesapeake Bay and its tributaries have long been famous for the immense flocks of wild fowl which resort to them at this

ite food of the Canvas-backs is the Tape-grass or Eel-grass, *Vallisneria spiralis*. This, which, by the way, is not a grass at all, has flat, tape-like leaves, two feet or more in length, and grows in slow streams, completely submerged. It is said that the Canvas-backs eat only the roots of this plant, while other ducks feed upon the leaves. The superiority of this species of

seems to be conceded that the excellence of the Canvas-back is due to the *Vallisneria*, and this relationship is recognized in the specific scientific name, the bird being called *Anas Vallisneria*. Duck shooting calls for the display of strategy, and those who follow it for sport or for profit resort to various ingenious expedients to get near the game. One of our artists sends

Fig. 2.—SHOOTING FROM A BLIND OR SCREEN.

Fig. 3.—TOLINO FOR DUCKS.

season, and have become especially noted as the resort of the Canvas-back, generally esteemed the most delicious of all ducks. In our markets, when the Canvas-backs bring four dollars a pair, other kinds are sold for a dollar or less. The ducks when they arrive from the North are very poor, but they rapidly fatten after reaching their feeding grounds. The favor-

duck is attributable to this particular food, which is in the Chesapeake called "Wild Celery," though it has no resemblance to celery, nor is it botanically related to it. A gentleman from Albemarle Sound informed us that Canvas-backs were abundant in those waters, but as they were without their proper food, "Wild Celery," they were less esteemed than some other species. It

Fig. 4.—MASKED BOAT.

us sketches he has taken in Chesapeake Bay, which illustrate some of the methods of hunting. Certain favored spots over which the birds pass as they fly from one feeding place to another are often rented at a high rate as shooting grounds. A point of this kind is shown in figure 1. Blinds or screens are built to hide the sportsmen who lie in wait for the birds. A nearer

Fig. 5.—SHOOTING FROM FLOAT.

Fig. 6.—NIGHT SHOOTING.

view of one of these blinds is given in figure 2.

A curious way of enticing the birds within range is called *toting*, fig. 3. Dogs of a small breed are trained to run backwards and forwards on the shore; the dog is sometimes made more conspicuous by tying a red handkerchief around its body. The ducks, observing the motions of the dog, swim towards the shore to investigate; their curiosity being satisfied the flock sails off again. As they turn and present broadside to the sportsmen, they shoot and often kill large numbers. A different breed of dogs is employed to bring the dead game in from the water.

Among the other devices our artist has represented, is one in which the boat is converted into a rude resemblance to a huge swan, figure 4. A boat of this kind can be silently paddled within shooting distance of a flock, which is shot at through an opening in the breast of the monster.

Figure 5 represents shooting from a float or battery. A broad platform is so ballasted that it just floats upon the surface of the water, and is anchored in a place where the birds resort. The sportsman takes his position upon this, and is screened from sight by means of sedges or boughs. Decoys, to attract the birds, made of wood and painted to resemble ducks, are anchored near by. It is necessary to have an attendant in a skiff, at a distance, to pick up the birds as they are shot by the man on the float.

Night shooting, represented in figure 6, is sometimes practised, but is not regarded with favor by sportsmen, as the birds, if alarmed in the night, are not apt to return to the same feeding ground for a long time after being disturbed.

Punt shooting, in which an enormous swivel gun is used, the discharge of which slaughters birds by the hundred, is, we believe, properly prohibited by law in the Chesapeake waters.

Care of Tools.

We recently saw in one of the best farming districts of New England, a mowing machine left in the open field just where the last swath was finished. The man who owned it had kept it out without shelter for several years. He had unscrewed the cutting gear and housed it, from the apprehension that it might possibly rust. But he had not thought that the running gear would rust, or the wood rot. Yet this man was not lacking in intelligence or in capital. He had a good farm and plenty of barn room, and fifteen minutes' labor at the close of the hay harvest would have secured the machine against the weather. It was simply from the habit of carelessness in which he had been educated, that he did not put it under cover. That fifteen minutes of ease will cost him dear. A machine thus used may last five years, probably less. Properly cared for and housed, it would be good for ten. If his machine cost him \$125 he pays \$25 a year for field exposure. This is not all; a mowing machine never runs so smoothly or cuts so well as after a few weeks' use when it is new; every day's exposure to sun or rain, or even to the dew of the night, rusts, warps, shrinks or swells some parts, which, if kept dry and oiled, would remain in the best condition very long. So the amount of labor expended in using the machine is greatly increased, and even the extra amount of oil and the greater frequency of application will of itself be an important item, and we may add to the \$25 a year above stated, \$5 more to balance the account of pecuniary loss and extra labor. This is patronizing the picturesque at great disadvantage. Can farmers afford this esthetic indulgence?

Walks and Talks on the Farm—No. 58.

We got home yesterday from a fishing excursion among the Thousand Isles. The children enjoyed the trip as much as any of us, and returned home a great deal better. The *Agriculturist* is right in advising farmers to take a few days' recreation. We need it as much as the professional or business man. The mind is apt to get into a rut, and a change of scene and associations is as beneficial as a change of air and occupation. The despondent man finds that others, too, have their trials, and that weeds grow in other sections as well as in his own, and he will come home with a determination to take a more cheerful view of his lot in life, to be a better man and a better farmer. The self-satisfied man—if such an individual can be found among our farmers—will find that there are other people in the world as conceited and as disagreeable as himself, and he may return home with a few new ideas in his head, and a grain or two of humility in his heart.

You have to hire a boat and a man to row, who furnishes the fishing tackle. We got to the Islands about 6 o'clock in the morning, and by 8 o'clock we had had breakfast, and were in the boat trolling for pickerel. The change from a dusty summer fallow to the cool breeze on the lake-like river was most invigorating; and when we got a seven-pound pickerel at the end of a two hundred foot line, we forgot that there was such a thing as winter-kill or rust or shrunken wheat; that weeds grew fast and hired men worked slow; almost regretted to see a black cloud in the west, although the potatoes at home were suffering from want of rain. In fact, we forgot what we sought,—a few days' relief from the cares, toils, and anxieties of farm life. The man whom we engaged to row our boat proved to be a farmer. He owned a farm of over two hundred acres on one of the Islands, but rented it out on shares and occupied himself during the fishing season in rowing, and at other times he "traded a little," buying chickens, turkeys, and geese, and sending them to New York. An English gentleman who was one of our party could hardly believe that the man we had hired to row us was "a farmer." "And," said he, when the idea got fairly into his head, as it did in a day or two, "he is not only a farmer, but he is a landowner, and yet he is here rowing a boat for hire and cooking our dinners!" Butter was selling at wholesale in the neighborhood for 40 cents a lb., and potatoes \$2.00 a bushel; oats, 75 cents; barley, \$1.50; spring wheat, \$2.00; and other things in proportion. At the hotel we could rarely get a tomato or a cucumber, and melons would have brought any price that might be asked. Huckleberries were provided on Sunday as a special treat for tea, and once or twice we had stewed apples. Beef, taking quality into consideration, was higher than it is in England, and yet the owner of a two hundred acre farm thought he could make more by rowing a boat by the day than in cultivating his land!

We visited one farmer who had bought a whole island of about 120 acres in the middle of the river, some four miles from either shore. He was monarch of all he surveyed, and as happy as a prince. He had a capital garden, and his good wife had covered the piazza with morning glories, flowering beans, Virginia creeper, etc. He raised good crops of spring wheat, corn, oats, potatoes, etc., and on my complimenting him for his good farming, he remarked,

"The land is first-rate, but it has been neglected and is full of weeds, but I'll fix 'em." "You can't do it, Old Boy," said one of the oarsmen. "The ground is full of weeds, and always will be. It's no use your trying to get rid of 'em." "But if none are suffered to go to seed," I remarked, "and you kill all that grow, you will in time have a clean farm." "That may be so, where you come from," he replied, "but it isn't so here. The ground produces them, and as long as there is any ground left, you will have weeds, and they are getting worse every year."

Of course, a man who has such notions mistakes his calling when he turns farmer. He had better row a boat for a living. Few people will confess that they think weeds spring up spontaneously, but there are a great many farmers who act as though they believed it. And yet it is certain that a soil can no more produce weeds without seed, than it can wheat or corn.

I visited a farmer who keeps a dairy of eighty cows. His dairy-house and cheese-room were at some distance from his residence, and he hired a man to make the cheese, who did all the work. It seemed to be a very nice kind of farming, and I told him if I could get men to milk, I would go into the dairy business myself. "No trouble about getting people to milk," he replied. "I don't hire a man or woman that can't milk, and most of them would rather milk than work in the field. We have a good many Canadians who come here to work, and over there you know, the women do the milking, and the men seem to think it is beneath their dignity. Sometimes a man comes here who wants work, but objects to milking. 'Very well,' I tell him, 'you need not milk.' At 5 o'clock in the afternoon the horn blows, and they all come home to lunch. They are pretty tired, and sitting down on a stool to milk is quite a relief. The new man is sent back to the field to work, sometimes all alone, and it is not many days before he requests to be allowed to milk."

There, as here, the pastures are suffering for want of rain, and few farmers have a supply of corn fodder to fall back upon. As a general rule, the corn fodder is as poor and as much dried up as the grass. It is sown broadcast, and suffers from drouth as much as the pastures. In a favorable season, and on rich land, a good crop is sometimes raised in this way; but in unfavorable seasons it is not needed, as the same causes which produce good corn fodder produce good grass. Corn fodder, to grow well and keep green during a severe drouth, needs rich land and thorough cultivation.

The truth is, if we farmed better, we should not be so constantly complaining of drouth. There are far worse evils than a dry, hot summer. We need heat to push vegetation forward rapidly. But a plant cannot grow without food, and if it has more heat than it has food, and has not an accumulated store in itself to fall back upon, it withers up. That plants store up matter cannot be doubted. The seed of timothy is formed from organized matter accumulated in the stem and leaves, and not directly from food obtained from the soil. The same is true of oats, and doubtless of wheat, corn, barley, peas, beans, clover, etc. Where there is an abundance of this organized or partly organized matter in the leaves and stems of wheat, for instance, dry, hot weather will not hurt the crop. But if there is a deficiency of this matter, the heat will shrivel up the grain. What we should aim at is to get a healthy, vigorous growth before the hot weather sets in. We

know from actual experiment that an active artificial manure, like sulphate of ammonia, will do more good on winter wheat when sown in the fall, than when sown just before the plants begin to grow in the spring. One would think that during the cold weather of the fall and winter, when there is little growth, the manure was not needed, but doubtless there is a greater accumulation of matter in the roots and leaves of the plants, and when the warm weather comes, the crop "shoots right ahead." I will not say that a liberal top-dressing of good manure this fall will prevent a pasture from drying up next summer, but if other conditions are favorable, I have no doubt that such would be the case. And stock will do better in such a pasture if we have a dry, hot summer, than if we have a cool and moist one. There will not be so rank a growth, but the grass will be richer. It will be more highly organized, and consequently far more nutritious.

Except in the neighborhood of large cities, "High Farming" may not pay, owing to the fact that we have so much land. But whether this is so or not, there can be no doubt that the only profitable system of farming is to raise large crops on such land as we cultivate. High farming gives us large crops and *many of them*. At present, while we have so much land in proportion to population, we must, perhaps, be content with large crops of grain, and few of them. We must adopt the slower but less expensive means of enriching our land from natural sources, rather than the quicker, more artificial and costly means adopted by many farmers in England, and by market gardeners, seed-growers, and nurserymen in this country. Labor is so high that we cannot afford to raise a small crop. If we sow but half the number of acres and double the yield, we should quadruple our profits. I have made up my mind to let the land lie in clover three years instead of two. This will lessen the number of acres under cultivation, and enable us to bestow more care in plowing and cleaning it. And the land will be richer and produce better crops. The atmosphere is capable of supplying a certain quantity of ammonia to the soil in rains and dews every year, and by giving the wheat crop a three years supply instead of two years, we gain so much. Plaster the clover, top-dress it in the fall, if you have the manure, and stimulate its growth in every way possible, and consume all the clover on the land or in the barn-yard. Do not sell a single ton; let not a weed grow, and the land will certainly improve.

The first object should be to destroy weeds. I do not know how it is in other sections, but with us the majority of farms are completely overrun with weeds. They are eating out the life of the land, and if something is not done to destroy them, even the present high prices cannot make farming profitable. A farmer yesterday was contending that it did not pay to summer fallow. He has taken a run down farm, and a year ago last spring he plowed up ten acres of a field, and sowed it to barley and oats. The remainder of the field he summer-fallowed, plowing it four times, and rolling and harrowing thoroughly after each plowing. After the barley and oats were off, he plowed the land once, harrowed it and sowed Mediterranean wheat. On the summer-fallow he drilled in Diehl wheat. He has just thrashed and got 22 bushels per acre of Mediterranean wheat after the spring crop, at one plowing, and 26 bushels per acre of Diehl wheat on the summer-fallow. This, he said, would not pay, as it cost him \$20

per acre to summer-fallow, and he lost the use of the land for one season. Now this may be all true, and yet it is no argument against summer-fallowing. Wait a few years. Farming is slow work. Geddes remarked to me, when I told him I was trying to renovate a run down farm, "you will find it the work of your life." We ought not to expect a big crop on poor, run down land, simply by plowing it three or four times in as many months. Time is required for the chemical changes to take place in the soil. But watch the effect on the clover for the next two years, and when the land is plowed again, see if it is not in far better condition than the part not summer-fallowed. I should expect the clover on the summer-fallow to be fully one-third better in quantity, and of better quality than on the other part, and this extra quantity of clover will make an extra quantity of good manure, (and there will be more clover roots in the land), and thus we have the means of going on in improving the farm.

Barley is a paying crop on good land. I am offered \$1.50 a bushel, and I see Canadian barley is quoted in Buffalo at \$1.75. I had 525 bushels, "thrasher's measure," from a little over 10 acres, and have some rakings yet to thrash. This field was heavily manured for corn, and was sown the last of March and first of April. On another field of about 14 acres, not manured, but thoroughly cultivated for two years in beans and corn, I had 420 bushels, or only 30 bushels per acre. Now the extra yield of 20 bushels per acre, say \$30, will go far towards paying for the manure, and I am satisfied that there is considerable strength yet left in the land, which will manifest itself on the wheat. I am encouraged to go ahead and try to make more and richer manure. I have got in over a hundred good loads of clover hay, and I propose to feed it all out this winter. I have a big stock of timothy, rather unripe, from the "old stump lot," and if the drought in England puts up the price of hay here to \$25 per ton, as is quite probable, I will sell it, and buy oil cake with the money to feed out with the clover hay. So with the clover seed, if we have any. And if the paper men will pay as much for straw as they did last year, they shall have half the stock, and I will buy oil cake with the money to feed out with the other half and with the clover. I shall not get more than half the bulk of the manure, but one load will be worth two, and we save half the labor of drawing out and spreading.

But do not sell nice, bright, wheat straw, as one of my neighbors did a few days since, to the paper men for \$2.00 a load, and they put on from 20 to 25 cwt. on each wagon. There is an unusual quantity of straw in the country, but if we are to have an export demand for hay at high prices, we shall need all our straw before the middle of May. The Deacon says he has observed that seasons which give us a large quantity of hay and straw, are followed by long-foddering or severe winters, and there is none to spare. The hay, too, is perhaps not as nutritious, and does not spend as well. At all events it is unwise to waste or sell the fodder thus early.

In harvesting clover for seed, why is it necessary to let the crop lie in windrows or small bunches until the fodder is spoiled? Will not a good machine thrash it clean unless the heads are steeped as they do flax, and rotted? An old farmer who lets his clover lie out sometimes until snow comes, told me that frost would not hurt the seed after it was cut (which is true), and that it was necessary to rot the heads in

order to get the seed out. I take as much pains in curing clover for seed, as for hay, and when the weather is favorable and the clover heavy, it makes hay that smells as sweet and looks nearly as fresh as the first crop. And I do not believe there is any trouble in thrashing it—though it is true I have never yet had more than two and a half bushels of seed per acre. If there is a good growth of clover, it will yield at least a ton to the acre. And a ton of clover and seed, when well cured, contains about 50 lbs. of nitrogen. A bushel of clover seed contains probably about as much nitrogen as peas, say 2½ lbs. Now if in such a crop we get 4 bushels of seed per acre, there is 10 lbs. of nitrogen in the seed and 40 lbs. in the fodder. And it seems a great pity to waste the latter. John Johnston says a crop of clover seed will impoverish the land more than a crop of wheat. And it is a fact that a ton of clover hay contains more nitrogen than 30 bushels of wheat and straw. But in the case of the wheat, about 40 lbs. of the nitrogen is in the grain, and 10 lbs. in the straw, while in the case of clover only 10 lbs. is in the seed, and 40 lbs. in the straw. So that if the clover straw is retained on the farm, the exhaustion is more apparent than real. The land from which the crop of clover seed was taken, might exhibit symptoms of exhaustion, as compared with a field that was pastured. But still, four-fifths of what is taken from the field is returned in the shape of manure, and the *farm* only loses one-fifth, while in the case of wheat it loses four-fifths.

OSAGE ORANGE AND SILK-WORMS.—André Leroy, of Angiers, France, writes to the Revue Horticole, that the Osage Orange has not received the attention as an ornamental tree that it merits. Mr. L. states that the leaves answer as a substitute for those of the Mulberry, as food for the silk-worm. He says: "Of 4,000 that I have raised with the leaves of this tree I have not lost one. Now they have commenced to spin and give me superb cocoons."

Curing and Use of Corn Fodder.

Well cured corn stalks of the smaller kinds are worth as much as good hay as food for cattle, if cut up while green, and one or two days before the first frost. The very early kinds usually will ripen and turn brown before frost, and by this process of ripening, just as it is with grass that stands too long, the sapid and nutritious substances are, to a great extent, converted into or enclosed in woody fiber, so that they are neither palatable nor useful to the stock. Frost produces an immediate change of a similar character, chiefly in the leaves and tender parts of the stalks, which are the most valuable for feeding; but if they are exposed for a few hours to the hot sun after cutting up, though quite green, so much of the water evaporates that frosts produce little or no effect. It requires, however, a good deal of drying to extract sufficient water from the thick bolls to prevent them moulding when housed. After the corn is cut up and placed in stacks, well braced and bound to prevent rain from entering and wind from overthrowing them, this may go on gradually for several weeks. The grain if not quite ripe gains rapidly, at the expense of part of the juices of the stalks. When the ears are hard and their butts dry, they may be husked. The stalks will still need more drying in all probability, and bound in bundles of convenient size, should be again stacked up as before. If care be taken

that no stooks are left partly or entirely blown over, and that no bundles lie upon the ground, the corn fodder may stand out until there is danger of snow, without essential harm, and the more thorough the drying, the less the liability to mould. Musty corn fodder is not so unpalatable to the stock as musty hay, but the loss of nutriment must be about the same.

When sowed corn is cut for dry fodder, the stubble should be left low, and after one or two days sunning and turning, the corn should be bound in small bundles, and set up in small open stooks well braced, or against a fence, or against both sides of poles, supported $3\frac{1}{2}$, or 4 feet above the ground, by being bound to stakes with withes, or laid in the crotches of crossed stakes. This is perhaps the best way; the fodder is kept clean, it has thorough airing and dries more rapidly than if stooked. These ranges should stand north and south, so that the sun may have equal chance at both sides.

The value of this material for food is seldom if ever overestimated. Cut up, salted a little, sprinkled over with corn meal or oil-cake, and then moistened thoroughly and left 12 hours, it is made one of the most nutritious and palatable articles of diet for cattle. Horses also thrive upon stalks prepared in this way, but it is not best to let it form too large a proportion of the feed of working horses, as it is said to make them what is termed "soft." A very large part of the value of this fodder is in the stalks, but these are often so tough and hard as to be unpalatable even after they are soaked. Cooking by steam is therefore highly approved of. No practice is so wasteful as feeding cornfodder uncut, when cattle simply strip off most of the leaves, and, if fed upon the ground, trample a large portion of the remainder into the dirt.

Virginia Way of Loading Heavy Logs.

All the handy ways of doing things do not originate in Yankeeedom, by a great deal. Handling heavy logs is one of those jobs which any farmer but a real woodsman undertakes with the hearty wish that it were over. A Virginia correspondent goes to work in the following way. He has a "hook" made of a bar of iron 2 inches wide by $\frac{1}{4}$ inch thick, bent so that it will hang over the top of the wheel as seen in the engraving, figure 1. It is really two hooks connected by their shanks, forming a sort of horse-shoe shaped bow or bight, which hangs below

Fig. 1.—SKID AND HOOK.

the fellee. Into this bight the end of a skid is placed. This is notched so that when the log is drawn up it will roll over the top of the wheel. For hauling short distances one pair of wheels answers best. The butt end of the log is, of course, put upon the axle, and the wheels are cramped with regard to the skid, so that when the log rolls up it will not roll off the wheel on which the skid rests, without bearing upon the other wheel, and thus being let down upon the axle without a fall, and without "clocking." After the wheels and skid are in position, if a chain or rope is attached to the axle, and passed

under and over the log, a pair of horses or cattle will quickly roll it up. In hauling long distances a wagon should be used, in loading which two skids are needed, and it is usually best to take

Fig. 2.—ARRANGEMENT FOR LOADING HEAVY LOGS.

off one hind wheel. The diagram which accompanies this, shows about the relations of log, skid, and pair of wheels; the dotted lines indicating the position of the log as it is hauled up. The tongue of the cart should be made fast to a stump, crowbar, or something of the kind. Simple mechanical contrivances like this will often save a great deal of hard work. Almost every farmer has his peculiar methods of lightening or expediting work, and it should be a pleasure to communicate them to the others.

Storing Potatoes for Winter.

It is often a matter of very great pecuniary importance for a farmer to be able to keep his potato crop until spring. Many made very handsome sums by pursuing this course, the past season. Potatoes were bought last fall for fifty cents a bushel, and those in good order were sold very generally in spring for two dollars. As long as the custom of early marketing prevails so generally, the man who cultivates the new seedlings and stores them until spring, will be likely to pursue a safe course. Prices are generally enough higher to pay for the extra handling, and leave a margin for profit. They can be stored upon the surface of the ground in any dry position in the same manner as turnips, but this requires much care in covering the pits on account of the extreme weather that prevails in the best potato districts. It is not uncommon for the earth to freeze two feet deep, and the raising of a mound with walls of that thickness over potatoes is a great labor. It has its advantages however in saving carting, and once handling. The heaps or pits are usually made upon the field where the potatoes grow, and so near together that when the potatoes are picked up they are taken directly to the heaps, which contain from 30 to 100 bushels each, as suits the convenience of the farmer. A light covering of straw is thrown over the heap and the earth is put upon the straw, making a roof that will shed water and keep out the frost. When the farmer wishes to keep his pota-

atoes for the spring market, this is a good method. Another way is to store the potatoes in pits, partly below the surface, but this can only be done where the soil is perfectly drained. There is not much difference in the labor involved, or in the security of the crop against frost. Farmers living near ports, who wish to ship their potatoes in the winter, build cheap vaults or cellars in hill sides, that will hold from 500 to 1500 bushels. The vault has a window and shoot arranged for tipping in a cartload at a time, and a door is upon the south end for taking the potatoes out. In New Jersey and on Long Island it is quite common to store potatoes in the house or barn cellar, to be ready for market at any time when the prices suit. Immense quantities are stored by dealers in the city of New York, mostly in barrels, but sometimes in bulk. In cellar storage straw should be thrown over them to keep out the light. This crop keeps best, away from the air, in darkness, and at a low temperature, a few degrees above freezing. That method is best which secures these conditions most perfectly, with the least labor and with the least expense.

Loss in Stacking Hay.

A farmer of sound judgment, and large experience in cutting and storing hay, estimates his own loss in stacking at twenty-five per cent. He cuts probably a hundred tons a year, and stacks a fifth part of it for want of barn room. He has very properly made up his mind to build a new barn. We think his estimate is not wide of the mark. There is a large loss from moulding at the bottom of the stack, and old rails, boards, or straw, will not wholly prevent it. Then the whole external surface for 3 to 6 inches, is weather beaten, and loses much of its sweetness, and it is not improbable that this loss of aroma extends through the whole stack. The conviction is universal among intelligent men that barn stored hay is worth much more than that which is taken from the stack. Why then follow this wasteful practice? Look at the great loss to this farmer who cuts one hundred tons of hay worth \$2,000. According to his own estimate he pays \$100 a year for the privilege of stacking one-fifth of his crop. This is but a small part of the loss where the hay is fed out at the stack. It costs at least a third more hay to keep cattle without shelter. These are strong arguments for more barn room.

A Danish Cow Halter.

The horns of neat cattle offer a means of attaching a rope to tie them by, to which we are so much accustomed that other head fastenings seem awkward under any circumstances. Neck ties are in common use, and allow the animals more motion with the head than halters or head ties, but less with the body. Fractious animals are in danger of hurting themselves in their plunges, when they are fastened either by the neck or with a halter. Hornless cattle must be fastened in one or the other of these ways, and a halter which will give perfect control over the animal is a desideratum. A young Danish farmer made in a few minutes,

CATTLE HALTER.

and applied to a hornless cow of the writer's, the device which we figure. It is easy and not in the way if the cow does not pull, if she does it causes pain by drawing the two check sticks together, causing them to press on the cheek bones. The tie line is placed in the long check piece

Left-hand Plows and Three Horses Abreast.

In the June number for last year we had an article on using three horses abreast, claiming for the practice a notable increase of power—that is, a more economical application of the power; and following it was a discussion of the merits of left-hand plows. "H." of Hampshire Co., West Virginia, sends us a brief description of how they use

THREE HORSES
ABREAST.

three horses before left-hand plows in his neighborhood. It will be understood with the accompanying diagram, which supposes the observer looking directly down upon the plow and team. Our correspondent says: "With a left-hand plow the near horse walks in the furrow, and is called the 'leader.' He is driven with a single line, a steady pull upon which means *Haw!* and two or three successive jerks, *Gee!* The other horses are managed by 'coupling straps' and 'jockey sticks.' Many do not know how to hitch up such a team, and I will describe our way. The outfit required besides the common plow-gear, is two jockey sticks, two coupling or hold back straps, three whiffletrees, a double-tree and tripple-tree. These being at hand, first lay the tripple-tree on the ground with the long part to the right; put the double-tree on the left, and a whiffletree on the right, and two whiffletrees on the double-tree. Then put the leader in place; next hitch up the middle horse, fastening the jockey stick to his high bit-ring, and to the hames-ring of the leader. Connect the bit-rings of the middle horse by a chin strap and carry the coupling strap or rein back, attaching it to the leader's trace-chain, well back, so that he cannot get ahead of the leader. Hitch up the outside horse in the same way; then all will work in line, and, as the leader walks in the furrow, little or no driving is required. Two men with three horses each can plow in this way as much in a day, and do it as well, as three men with two horses each, saving the labor of one man."

Mr. Harris, in his "Walks and Talks" in July last, discusses briefly "three-horse eveners" and how to make them, to which we refer the reader.

Thorough Draining and Deep Tillage.

We had a wet spring, at least in some parts of the country, though it was dry enough in others. It is strange that wet seasons set people both thinking and working at underdraining—while dry ones do not. Yet this very year wherever drought has parched the soil and hurt the crops, well drained land has come out comparatively well. Thorough draining means deep tillage, for no wise man puts from \$50 to \$80 expense upon an acre—unless it be on a

graded lawn—and then leaves it with only surface culture. The plow is followed by the subsoiler, and the yellow dirt sees the light little by little, year by year, until a rich crumbly soil a foot deep rolls up in mellow waves, behind the great plows,—never wet, never dry, always moist, never cold, early in spring, late in autumn, inviting culture and well rewarding it. We are too apt to look upon droughts as dispensations of Providence which we must take without repining, and cannot ward off. A few years ago the old fogies held that the reclaiming of swamps and bogs was flying in the face of Providence, as if they had not been created for some wise purpose. So indeed they were—on purpose to be drained, and so if you please droughts are sent on purpose to test our good husbandry in avoiding the harm they might do us, and profiting by the good. The flow of water during droughts being upward by absorption and evaporation, fertilizing matters are brought up to the surface which in ordinary seasons are washed down; hence the years succeeding dry ones are often years of plenty.

Drainage is usually best done in Autumn; its principles are simple and when well understood success is certain. We have often discussed the subject, and there are excellent treatises upon it, of which none is better than Col. Waring's *Draining for Profit*, (see our book list on another page) which gives the best ways for doing every thing, under the supposition that, if it is either necessary or desirable to slight the work or only half do it, methods enough will suggest themselves to almost any body. Drains should take the most direct course down hill. The tiles should be too small rather than too large. For if small the swifter current will keep deposits from forming which would fill up large tiles. Wherever the line of descent is changed to a less fall per foot a silt-basin should be placed. A very gradual fall is all that is needed if it be regular. The bottom of the drain is the most important part to have exactly right; hence too much pains can hardly be taken to have the final grading perfect, and the tiles well laid. Collars for the tiles are of great advantage. The value of the drain is determined by the excellence of the poorest tile and the worst laid one in its entire length; as the strength of a chain is measured by that of its weakest link. Drains must receive their water from the bottom, not from the top, hence, pack clay or stiff soil upon the tile and make this layer 16 inches above the tile impervious to water. Deep drains farther apart are more economical in the long run than shallow ones near together—four feet being the depth usually advised and seldom reached. Tiles are often cheaper than stones, even if the latter encumber the land.

Implements for Cutting up Corn.

In cutting up corn we believe in either leaving fully eight inches of the butts, or in cutting as close as possible. It is a little easier to cut, leaving long stalks, but this involves in neat farming the labor of dragging the field with a pole, when the ground is frozen, in order to break the stubs off from the roots. When corn is to be followed by spring grain of any kind, it is very desirable to plow deeply enough to cover stubs and roots together, so that they will not be harrowed out, and lie on the surface, where they will be useless as manure, and in the way of the following grass crops. If the roots only be left in the ground, or if the stubs and roots are broken apart, there is little difficulty, and few

of either roots or stubs interfere with the evenness of the meadow when laid down to grass.

Were a dozen men to go to a field to cut up corn, scarcely two would have supplied themselves with exactly the same instrument. We describe and illustrate several of the common corn cutters. The most common is doubtless the *broken scythe blade*—variously handled. This simple blade, 18 to 20 inches long, may have a handle made, as in figure 1, by riveting

Figures 1 and 2.

a piece of wood upon each side at one end, or the edge may be battered down at that end for a few inches, and wound with leather or coarse cloth. This forms a heavy knife which will cut off three or four stalks at one blow, and has its representative in the stores in one of the many forms of the cane knife which is shown in fig. 3. These knives (*Machettes*) are made for the Southern trade, but some forms are very useful on the farm, and they may be bought for 63 cents or more a piece. Another home-made corn knife is part of a blade of a scythe, sickle, or any large knife, set diagonally to the handle in which it is riveted. Figure 2 represents still another kind of corn cutter, kept for sale in all the implement stores (costing about fifty cents), which is made in a similar manner to the one just described. We have repeatedly received sketches or descriptions from correspondents of a very simple and expeditiously made knife which is illustrated by fig. 4. It is a blade of any kind thrust through a piece of corn stalk near one of the lower joints. We have represented it as the point of a scythe passed through the corn stalk and bound in with wire. The wiring may not be necessary where they grow very stiff corn stalks. Implements in which the blade is at a considerable angle

Fig. 3. to the handle may be used with a drawing stroke, as well as for cutting with a blow.

Tools made for other purposes are in some hands very advantageously applied to cutting up corn. One of these is the sickle, or rather the grass hook, for the genuine sickle is a rare implement in modern farming. A large and rather heavy one should be selected, and it will be found one of the handiest corn cutters. The sickle form makes it useful in expeditiously gathering stalks that fall. The common bush scythe is less frequently used, but wielded by a strong man in heavy corn, three men will have about all they want to do to pick up and stack the corn as fast as it is cut. Finally we come to the common *field hoe*. The implement which has contributed so essentially to the growth of the plant, is one of the handiest to cut it down. Furnish a good steel hoe with a handle 16 to 18 inches long, and bring it to a sharp edge on the grindstone, and you have an efficient corn cutter. A single blow will cut up a hill of ordinary eastern corn, unless the stalks are a good deal scattered. It has the advantage in common with the bush scythes that the stalks may be conveniently cut very close to the ground.

Fig. 4.

Water for Man and Beast by the Road-sides.

A few months ago we asked the question, Why watering troughs are common by the roadsides in New England, rare in the Middle States, and almost unknown at the West? A correspondent, "H. T. H.," writing from Saratoga Co., accounts for the fact, by the geological formation of the country in these different districts. Springs, he says, burst from almost every New England hillside, while the brooks are in deep bridged gorges. In the Middle States the brooks are generally easy of access from the roads and so the necessity does not exist; while in many districts at the West both brooks and springs are very scarce. This is in a measure true, and perhaps the reason—nevertheless, the desirableness of having watering places both for men and beasts on all highways of general travel is a thing to be impressed upon every community. Horses ought to have an opportunity of drinking freely once in about an hour, while on the road, but not when approaching the journey's end. In hot weather, especially, they will go much farther, and draw greater loads with less fatigue and danger of injury from overwork, if frequently watered. The attractions along a line of travel are too often the taverns and dramshops, at intervals of short stages. Here one always finds the pump and water trough, and many a man would gladly pass by were it not for the necessity of watering his beasts, while many another rejoices in having a good excuse for taking time to solace his appetite with something less refreshing and more likely to do him harm either in dog days or in January, than pure water. "Drive Wells" are becoming quite common and are very cheap. They are of use, especially in countries where bubbling springs and hillside rills are not abundant. One of these set at a cross-road would often accommodate several neighbors in watering their cattle, etc., besides being of great service to the traveling public. A sound molasses hogshead makes two capital troughs; an old bent gunbarrel is an excellent spout for the water, and the best drinking cup for men to be kept by such a wayside fountain, is the face half of a coconut shell. The "mouth" hole being open, this affords a fine place to hang it up by, and this half of the shell is so nearly worthless for any other purpose that no one will steal it.

Tim Bunker on being "Sound on the Goose."

MR. EDITOR:—That letter you sent me from a Kansas man, who wants to know "if there is any profit in raising geese, feathers being seventy five cents a pound," struck me kind of queer. Are feathers the main thing in a goose? And if so, have they not found out all about it in that region where the "goose question" has been the main one discussed for the last dozen years? We are all *afloat* on that question out here in Hookertown, as the geese love to be, but I had supposed it was settled in Kansas some time ago. My neighbors, as I found when I came to consult them, were a good deal divided. We still keep up the Farmer's Club at the school house, that I wrote you about some time ago, and Tim Bunker's pew, as Jake Frink insists upon calling it, is pretty well filled even in dog days. Deacon Smith, who has large orchards, and grain fields fenced with rails, said it would not pay to raise geese. They were a

mischievous bird, always poking their necks through fences, and destroying more crops than they were worth. He wished there was a law against keeping them in any civilized community." Seth Twigg thought "feathers hadn't nothing to do with the question. I always sell my goslings at so much a head, and if the price is high enough, it pays. Otherwise it don't. A good deal depends upon having the right woman to take care on 'em."

"That's so," said Jake Frink. "Polly aller's makes her geese pay, and if I undertake to manage 'em it is no go. They don't hatch, or if they do, the wensels catch the goslings, or they get rose bugs in their crops, and they die on a sudden. I never had any luck with the critters."

Our minister, Mr. Spooner, said: "The profitable raising of these fowls depended very much upon circumstances. If one had a pond and an inclosed pasture near the house, and skill in the business, it was very profitable to have water fowl. But in a village like Hookertown, where neighbors were brought quite close together, he thought it a nuisance to keep geese in the highway. Even if they were yoked, they would sometimes break through into the garden, or the grain field, and do damage, and the injured party, perhaps, would lose his temper and kill his neighbor's geese to avenge himself. He had known long family quarrels to begin in some small trespass of this kind. He thought they ought to be kept out of village streets, as much as cattle and pigs, and if a man had not room for them upon his own premises he should not raise them."

This brought George Washington Tucker to his feet, whose geese are always in the road, when they are not in his neighbor's fields. "I can't see what's the use of having a common, and grass on it, if nothin' is gwine to eat it. There is a dozen acres or more here in the street, and there used to be a horse pond before Tim Bunker drained it, where poor folks could water their cows, and their geese have a place to swim. I am glad he can't drain off the grass into his own fields. If poor folks couldn't have their geese in the road they would have to give up raising 'em."

This discussion shows that Hookertown is not a unit on the goose question. We are an old community, and most of the people think they are civilized, but we have never been able to get geese out of our streets. The poor raise the cry of persecution, and the sight of that green grass on the common going to waste troubles a good many people besides Tucker. The geese at times make a good deal of trouble, and some have given up keeping them on this account mainly. This of course enlarges the pasture for others, and the flocks of Jake Frink, Tucker, Jones, and that kind of company, are always represented. They not only get into gardens, but into the meeting house on Sunday, or rather their noise does. I have seen many a good sermon spoiled by the noisy creatures. Just as Mr. Spooner gets in earnest and raises his voice, the geese set up their squawking, and the attention of the people is diverted. The windows are all open, these hot Sundays, and the geese seem to think church is held for their benefit. They speak in meeting a little oftener than is for edification. Mr. Spooner, of course, thinks goose raising won't pay even with feathers at 75 cents a pound. There is some human natur' in the pulpit, as well as in the pews.

They manage this business better down in Shadtown, where they don't allow any animal in the street. Every man who raises poultry

must keep them upon his own premises. The farmers there derive a handsome income from their poultry. They are favorably situated for raising water fowl, and have a great contest at the fairs in taking the premiums for the finest birds and the biggest flocks. The conditions of success in raising geese are a pasture with a pond in it. A small pond covering say less than a quarter of an acre is preferred to a running stream, or a large sheet of water, because it is more easily watched and kept free from minks, turtles, and other enemies of the flocks. They have a good many of these ponds naturally, and if nature has not favored them, they make ponds by puddling a few square rods with clay. Some use troughs, but they are not so good. The poultry woman seeks to make the most of the few geese she keeps over for stock. By good feeding they are encouraged to lay early, and the eggs are hatched out under hens. They will lay two or three litters, the last of which they are allowed to sit upon. The critical time with the goslings is when they first come off the nest and begin to feed. They are fed with dough made of Indian meal and "ballasted" with sand. This is considered very essential by the most skillful raisers. They gather sand from the shore and put it in a saucer with water, to which the young birds help themselves. They have the impression that many unskilled persons lose their goslings by turning them into pastures where they cannot get sand or gravel to fill their gizzards. However this may be, the poultry women of Shadtown are remarkably successful with their geese. They feel sure of a gosling that has taken in ballast. They are fed daily with dough, but get most of their living from grass. Flocks of one and two hundred are not uncommon, and a large trade is carried on in young geese for the city markets. Middlemen buy of the farmers when the goslings are about six weeks old, giving a dollar and a half apiece. They are put in pens and fattened a few weeks, and then dressed for market. The middlemen think the business pays, and the farmers are well satisfied with their share of the profits. If the housewife wishes to fill a bed or to make a down comforter for her daughter's wedding, she keeps her geese until Thanksgiving or Christmas, when the feathers and down are perfect, and the flesh is cheap, but the early sales are preferred without reference to the price of feathers. The Shadtown folks are "sound on the goose."

Yours on command, TIMOTHY BUNKER, Esq.,
Hookertown, Conn., Aug. 15, 1868.

An Out-door Cellar.

The storing of roots and vegetables in a house cellar in large quantities is always objectionable. The temperature is necessarily increased by the fires kept up in the house during winter, and this favors decay, or commencement of growth in vegetables. Besides gaseous substances of an unpleasant odor usually pervade the dwelling, which are injurious to health. Serious illness frequently arises from these well stocked cellars. A safer plan is to have the cellar store-room by itself. The best location is in a sandy or gravelly hill side, that needs no drainage in the wettest season. If not dry it must be made so by artificial means. One half the depth of the cellar may be below the surface. A room ten feet square and eight feet high will hold about 640 bushels, and each additional foot of length will add 64 bushels to its capacity if filled full to the top. A narrow width is to be chosen on account of convenience in roofing. In a region

of stone, this is the best material for the walls. Build them eight feet high and provide space for stairs and door at one end. Stone is also the best material for covering, if slabs twelve feet long can be procured to reach from wall to wall. In a granite or blue stone region these are easily procured from quarries by "gagging." Leave a man-hole at the top, large enough for ventilation and for pouring in roots from the cart. The sides, and top of the cellar should be covered with not less than two feet of earth, and neatly sodded. If on a side hill, it may be so arranged as to drive loaded teams on top. If stone for the covering is not convenient, a roof may be made by running up gable walls, putting on a log ridge pole and log rafters arranged like a common roof. The rafters should be placed near enough to touch one another, or nearly so, and be strong enough to hold the covering of earth. Batten the rafters with slabs and cover all with earth and sods. In a region where wood is plenty, and there is no stone, the whole wall may be made of logs. When finished it will be simply a log house underground. It will serve a good purpose for many years. Concrete also makes excellent walls, and this material may be laid in the form of an arch. If the cellar is made of stone it should be cemented to keep out all depredators.

Winter Rye.

Rye may very properly be classed among the neglected grains. It is not only less sown than wheat, oats, and corn, but it is put upon neglected land by a class of cultivators who neglect everything they undertake to raise. When land will no longer bear wheat and corn, it is turned out to pasture, and rye, and is run in this rotation until five fingers, St. Johnswort, and mulleins take full possession. Wheat is the lordly grain, and receives by far the larger share of attention. New varieties are brought from abroad, and originated at home, that farmers may have just what they want to escape the ravages of insects, and make the most of the peculiarities of their soil and climate. But rye is about the last resort of the poor farmer for breadstuff, and he seldom looks upon the contingencies of the next harvest. Yet there is no occasion for the general neglect of this grain. Its alimentary value is not much below that of wheat, and its market price is only about one-fifth less. It makes a very handsome and palatable bread, welcome as a change of diet upon all tables where it has been favorably introduced. It does best upon a rich hazel loam, but makes a crop upon almost any sandy or gravelly soil in fair condition. It is quite too generally grown upon a soil without any manure, yielding ten or twelve bushels to the acre. It is much better for the farmer and his soil, to use manure and take twenty-five to thirty bushels to the acre. Well rotted stable manure, or compost, is a good fertilizer for this crop. At least half the quantity used should be spread broadcast after the plowing, and be thoroughly harrowed in before sowing the seed. Of the commercial manures, Peruvian guano, fish scrap, superphosphate of lime, and bone dust, are frequently used. It is common to sow the seed broadcast at the rate of one and a half to two bushels to the acre, but rye is as much benefited as wheat by drilling. The drill not only saves seed, but, by the ridges it raises and the more uniform and deeper planting of the seed, it guards the young plants against the severities of winter. The best time for sowing is in September, or early

in October, though good crops are sometimes raised when sown just before the ground is frozen up. If the early sown rye is too luxuriant, it may be grazed by sheep or calves, but care should be taken to leave a good covering for the roots. The true place for this crop is not in alternation with pasture to rob the soil of its fertility, but in a regular rotation of six or eight years, applying manure enough either to this, or the preceding crop to secure thirty bushels of rye to the acre. At present prices, it is not difficult to get a gross return of fifty dollars or more from an acre of rye, which is much better than twenty dollars, which hardly pays expenses. An additional reason for increased attention to this crop is the great appreciation of its straw. It is extensively used for bedding, for packing, and for paper making. The demand for this latter use has so increased in some districts that it is quite too dear to be used for litter. It frequently sells for \$15 per ton and upwards. Rye always brings good prices, and ought to have more attention from cultivators.

GRINDING CORN ON THE COB.—We regard this practice with no favor if the corn is good. Analyses of the cob of well matured corn show that it contains scarcely any nutriment. It was obviously not made to be eaten. The cob parts with all it can of nutriment to the kernels, and is no more fit to be fed out than sawdust. When immature corn nubbins, and ears that have not dried well in the field are to be fed, the case is different. The cobs of these contain a good deal of valuable food, and, if the ears be kiln-dried, they may probably be ground to very good advantage. Besides kiln-drying, if the temperature be increased nearly to scorching, will convert a portion of the tenderest cellulose which would soon harden to woody fiber, into a digestible substance like starch or gum. This can, however, seldom be done, hence it is best to break up the unsound corn with a hatchet into pieces an inch or two long and boil them, with the little potatoes and other feed for hogs.

Poke or Pigeon-berry as a Garden Plant.

Now that the Poke or Pigeon-berry (*Physalis peruviana*) is ripening its long clusters of purple berries, we are reminded of the excellence of its young shoots in spring. It throws up vigorous sprouts as large as one's finger, clothed with undeveloped leaves. These shoots cut when young and cooked like asparagus, are so nice that one who has once partaken of them is sure to wish for more. The supply depends upon the chance plants that may grow by the roadside or in the fence corners. Why not put it in the garden and make a permanent bed, as with asparagus and rhubarb? If the shoots are so good without cultivation, they are likely to be better with it, and the convenience of being able to get "a mess" without running all over the country will be great. Who will try what cultivation will do with a plant that has heretofore been despised as a weed? Those who are disposed to undertake its cultivation should take up the roots this autumn. Divide the large ones and set in rich soil, three feet apart each way. That the plant has a medicinal reputation need not deter any one from eating it; whatever there may be active about the young shoots is entirely destroyed in the cooking. We have known those who have habitually eaten it for years without noticing any medicinal effects. In Europe the Poke is frequently grown in gardens for its showy character when in fruit.

Vinegar Making.

The remarks of Mr. I. D. G. Nelson, on vinegar making, at the American Pomological Society's meeting, have already been quoted in these columns; we now give an extract from a paper prepared by the same gentleman for the Indiana State Hort. Society, an association of which he is President. Vinegar may be made from inferior apples, but the better the fruit, the finer the product. Some think vinegar more profitable than selling the fruit. "My cider house is constructed with a view to convenience and economy in the manufacture of cider and vinegar, and is used for both alternately as the season requires. During the fall and until all the apples are ground up I make all the cider I can, and store it away in pipes, barrels, etc., under an open shed convenient to the cider house, where it will undergo vicious fermentation, and by the addition of a little good strong old cider vinegar it frequently gets quite sour before cold weather, and sometimes is fit for market by adding a little more strong vinegar. As soon as we are through making cider for the season, we remove the horse-power, (endless chain) grinder, pressing crib, vats, pomace boxes, etc., out of the basement of the cider house, and commence at once filling it with double and treble tiers of barrels of raked cider from the shed; start up the fire in the furnace, which is so constructed as to be out of the way when making cider, and the cider house is thus quickly converted into a cheap and excellent vinegar house. The thermometer is kept at about 75° Fahrenheit, and the process of vinegar making commences at once. If some of the casks appear a little 'lazy,' and not inclined to make vinegar as fast as they should, I take empty casks and put four gallons of the best vinegar in each, and drip slowly the contents of the sluggish casks, sometimes through hard wood shavings, but more generally over a board, into a dripping trough, then into the casks prepared as above—the object being chiefly exposure to atmospheric air, by reason of which it becomes aceticified. Thus it is quite frequently the case that the laziest casks are first fit to go out of the vinegar house, which we remove, as well as all others, as fast as they are ready, to the cellars, where they remain until required for market, so that by the time the house is required again for cider making, all the old cider is converted into vinegar, and removed out of the way. The endless chain horse-power, cider mill, vats, etc., are put back in less than half a day, and the vinegar house is now converted into a cider house again, and the work goes on as before. The apples are scooped out of the wagon and thrown upon the upper floor, through a convenient door, when they run off on an inclined plane to such a part of the chamber as they are needed, or at once run into a hopper that feeds itself. The whole work is done with a small amount of labor, which is one of its chief recommendations. This is, in brief, my method of working up a few thousand bushels of apples, many of which were formerly wasted, or from which I realized a very insignificant sum. The same thing is within reach of any farmer who can command a few hundred dollars to start with, on a cheap scale, and out of which, if he has the apples himself, or can purchase them at a reasonable price, he may soon build up a lucrative and legitimate business, and at the same time be of permanent usefulness in furnishing consumers with a genuine article of healthful acetic acid to take the place of the poisonous stuff now in general use as vinegar."

TROTTING HORSE "DEXTER."—Drawn and Engraved for the American Agriculturist.

The shortest time in which a horse can trot one mile has been the subject of many trials, and for aught that now appears we are nearly as far from a solution as when "two-forty" time was made in 1824, and remained for ten years unsurpassed. It was not until 1839 that a mile was trotted by any horse in less time than two minutes and thirty seconds. Then Dutchman trotted in two minutes and twenty-eight seconds. From this time twenty years passed before the mile was made in less than 2 min. 20 seconds, Flora Temple going over the course at Kalamazoo, to harness, in 2 min. 19 $\frac{1}{4}$ sec. This astonished the world and all lovers of the horse, as it indicated positive improvement, either in the horse, in our management of him, or in both. This time of the beautiful mare, often called the Queen of the Turf, has never been beaten except by the noble horse whose portrait we give above, and until 1865 Flora may be said to have been without a rival. That year Dexter trotted on Long Island, under saddle, in 2 min. 18 $\frac{1}{2}$ sec., the next year at Buffalo, in 2m. 18sec. In 1867, he trotted against Ethan Allen assisted by a running mate, the latter winning the three heats, Ethan trotting in 2m. 15sec., 2m. 16sec., and 2m. 19sec., and Dexter, unaided, in 2m. 17sec., 2m. 18sec., and 2m. 21sec. Thus this wonderful horse surpassed his best previous time. Alone, Ethan never approached Flora's time. After this, the same year, Dexter trotted at Boston, in 2m. 19sec., and subsequently against time at Buffalo,

winning \$1,000, by beating his Boston time. The winning of this trot, in which he accomplished the mile in 2m. 17 $\frac{1}{4}$ sec., was the occasion of his sale to his present owner, Mr. Robert Bonner. It is worthy also of notice that the Buffalo track was 27 feet over a mile long. The sporting public witnessed the retirement of this horse, whose unprecedented power and speed gave such promise of a brilliant career, with great regret. In Mr. Bonner's hands he has had the best of care, and though horsemen were prepared to hear of great speed when his powers should again be tested, yet the announcement of his having trotted a mile in 2 min. 14 sec. taxed the credulity of almost every one. However, the fact is established by good evidence, and his sanguine trainer promises even better results before long. This trial of speed was made to gratify two well-known turfmen who happened to be present while he was trotted by his trainer. A running horse was made to join him during the astonishing performance, to excite his ambition, and induce him to do his best.

DEXTER is a gelding, and was foaled in Orange County, N. Y., in 1837; his dam is half sister to Mr. Bonner's famous gray mare, Peerless, and has in her veins some of the choicest English blood. His sire is Rysdyk's Hambletonian, in whom flows the famous Messenger blood. His color is brown, and his height 15 hands 1 $\frac{1}{2}$ inches. He was first trotted at 7 years old, a fact which has great significance, and which we

doubt not will tend to keep colts and fillies of tender years off the track, and check at least one marked barbarity of the race course.

Keeping Squashes.

Every one who grows squashes will have at least the Boston Marrow and the Hubbard. These may be taken as the types of autumn and winter squashes. The Hubbard is only in perfection when it has been kept into late winter or early spring, and by proper management the Marrow—in some points not excelled by any other variety—may have its season very much prolonged. Mr. Gregory, of Marblehead, Mass., well known as an authority on the subject of squashes, through his hand-book on the subject, (see our book list), directs that the squashes should be cut upon the approach of frost, and, if possible, have two days' sun to sear the cut stems; they are then to be handled as carefully as eggs, and each one laid down on a spring wagon and taken to winter quarters. The squashes are to be kept at a low temperature without freezing, and in a dry place. Mr. G. gives a plan of the house in which he stores his squashes for winter. They are laid upon bins arranged one above another, and the house is provided with a stove, in which a fire is made whenever there is danger of freezing. A dry cellar will answer for storing winter squashes, if the above named conditions are observed.

SMALL-LEAVED FUCHSIA—(*F. microphylla*.)

The Fuchsias.

Not many years ago it was rare to see a Fuchsia outside of the green-house, and only seldom some of the old sorts under the name of "Ladies Ear-drop," were cultivated as house plants. Now the number of species has greatly increased, while by hybridizing so many varieties have been produced that with many all trace of their parentage is lost, and they have become common plants in general cultivation. The leaves of the Fuchsia are usually of pleasing shape, texture, and color. Various shades of green are to be found among them, and they are often beautifully veined with crimson. The flowers, which come from the axils of the leaves, are most generally pendent; though in some species and varieties they are erect. This graceful hanging of the flowers suggested the old popular name of Ladies' Ear-drop. The green and more or less globular ovary is at the bottom of the flower, then a colored calyx, within this a row of differently colored petals, then long stamens, and a still longer pistil. The calyx and corolla often furnish marked contrasts of color, and we have a white calyx with purple or rose corolla, or these colors reversed. Great difference is presented in the length of the flower and its size, and there are several varieties that are finely doubled. The fruit is a berry, the seeds of which grow very readily. The stamens and pistils being very conspicuous and distinct, the operations of hybridizing and crossing are readily performed, and the Fuchsia is one of the favorite plants for experiment in the production of new varieties. The attempts at window cultivation of the Fuchsia are generally failures, for the reason that but few kinds bloom in the winter. A few days ago we were

called in by a friend who wished us to see what was the matter with his Fuchsias, and tell him what would make them grow. They had done growing, the wood was ripening and most of the leaves had fallen. Florists know how to treat the Fuchsia;—they give it a season of rest—but most other people think that it is the business of a plant in a pot to grow all the time.

When the plant has done blooming, put it out in the open air and let it ripen its wood; before frost, remove it to a cool cellar where it may remain in a dormant state, with just moisture enough to avoid absolute dryness of the soil. In February or March repot in new earth containing plenty of leaf-mould, cut back the branches severely, and place in a warm room, and give water moderately. The young shoots will soon break in such abundance that usually a portion will need to be removed. The desired form may be given to the plant by pinching the new growth. A pyramidal shape may be made by keeping the lower branches the longest, or the plant may be trained to a frame or trellis. Nothing is easier to start from cuttings than the Fuchsia. The young shoots potted in sandy soil and covered with a glass, will strike root without artificial heat, and form good plants the same season. Our engravings give two species, well enough known to florists, but which are not common in general cultivation. The Brilliant Fuchsia (*F. fulgens*) has remarkably long, vermilion colored flowers, in clusters. It is one of the best for planting out, but like all the rest, should have a partial shade. The Small-leaved Fuchsia (*F. microphylla*), looks very much unlike the rest of the genus. It has small leaves and very minute flowers, and is altogether a very pretty plant. This is one of the few species that will bloom in winter.

Callusing Cuttings.

The propagation of plants by cutting is an operation in which some persons meet with uniform success, while with others, failure is the rule, and success the exception. We refer now to those cuttings made from ripened wood, such as the stems of grape, currant, quince, and of the roots of blackberry, Japan quince, and many other shrubs. When a piece of stem or root is severed, it, so to speak, puts forth an effort to make a new plant, and if the conditions are favorable, it generally does so. In the seed the root is provided for, the radicle pushes its way into the ground, and rootlets spring from it, all from the nourishment contained within the seed itself. The roots once established, the plant grows rapidly. In making a plant from a cutting, we have not everything in readiness for roots to start at once. Time is required for the cutting to accommodate itself to a new state of affairs. If a grape vine cutting be planted in a warm room with plenty of light, leaves may appear, and a short growth be made, when suddenly the plant withers, and the disappointed amateur takes up his plant and finds it has no root. The bud has been stimulated by light and heat, and all the nutriment the cutting contained has been expended in making a feeble shoot. Had the cutting been properly treated,

BRILLIANT FUCHSIA—(*F. fulgens*.)

the bud kept cool while the lower end was damp and warm, the result would have been different. When a cutting is placed under proper conditions it prepares to form new roots. It needs moisture and a low temperature. The nutritive matter in the stem accumulates at the place where roots are to appear, and forms a rough excrescence of a whitish color and a spongy texture, and when this appears, roots are quite (though not always) sure to follow. This excrescence is called the callus, and cuttings, on which it has formed, are said to be "callused." With autumn planted cuttings this process takes place in early winter, and the roots, if they do not form at that time, follow in spring. With many plants our winters are too severe, and the cuttings need to be buried below the reach of frost, or placed in earth in a cellar. Moss is better than earth for callusing cuttings. The peat or bog moss (*Sphagnum*), so much used for packing, has qualities which adapt it for this use. It is a poor conductor of heat, does not readily decay, and is very retentive of moisture. We some years ago accidentally left some cuttings of the Delaware grape in a box of damp moss, and found them nicely callused ready for planting. Cuttings of the grape, currant (if not convenient to plant in autumn,) of hard wooded ornamental shrubs, and of blackberry roots and other plants increased by root cutting, may be placed in a box of damp moss, which is to be put into a cellar where it will not freeze, nor yet get much above the freezing point. As spring approaches the temperature may be allowed to increase gradually, and by the time it is safe to plant, the cuttings will be found well callused, and in many instances with roots. The requisites are, proper moisture, a low but not freezing temperature, and darkness.

Forcing Strawberries.

The forcing of fruits, i. e., bringing them to perfection, by aid of structures and artificial heat at a period considerably in advance of their natural time of ripening, has been but little practised in this country. The reports which have gone abroad that strawberries in February and March bring \$4 a quart in our large cities, have induced several to ask about forcing. Four dollars a quart for strawberries sounds large, (though it is nothing to a guinea an ounce, the price that has been paid in London for the first fruit), but few think of the care and labor necessary to produce the quart of berries, or reckon the interest upon the necessary houses or frames. That this culture may be made profitable, we do not doubt, but we would not advise any one who has had no experience whatever with growing plants under glass to attempt it, other than as an experiment. A common hot-bed or a cold frame will answer for a first trial. When a house is used, the plants should be as near to the glass as possible, and for this reason the houses figured by Mr. Peter Henderson in his *Gardening for Profit*, are well adapted. In England, houses especially constructed for the purpose are used. Figure 1 shows one of these in which the glass is so arranged as to be directly over the shelves containing the plants. Figure 2 shows a section of a pit used in France for forcing. The pit is built of plank set in an excavation sufficiently wide to allow of a heavy coating of manure to be placed at each side. The plants are placed upon a stage to bring them near the glass, and the spaces between the pots are filled with moss. Below the stage are hot water pipes, *B, B,* in the figure, to supply heat when needed. The pit is 2 feet high in front, $3\frac{1}{2}$ at the rear, and $4\frac{1}{2}$ feet wide.

The variety chiefly employed around New York for forcing is the *Triomphe de Gand*; *Trollope's Victoria* is sometimes used, and near Boston an old variety, the *Cremont*, is a favorite

Fig. 1.—ENGLISH STRAWBERRY HOUSE.

with some growers. The best plants are those which were struck in pots from the first runners of last spring, and which have been gradually prepared for forcing by shifting them into larger pots as needed. In the absence of plants thus treated, good year old plants may be carefully taken up and potted. In either case the soil should be rich—at least one part of well-rotted manure to three of good loam—and the pots well drained by putting a few pieces of broken crock at the bottom. Set the pots close together and give water sufficient to keep the ground just moist. If soaking rains come on, turn the pots on the side or remove them to a shed. They are to be kept cool and free from injury by hard frosts, until wanted for forcing, and may be placed in a cool house or pit, when the weather becomes very frosty. About three

months are required from the time the plants are started until the fruit is ripened. The temperature should be gradually increased; 65° to 75° degrees being the proper range by day, which may sink 15° during the night. The soil in the pots is to be kept properly moist, avoiding over-watering, and the foliage is to be sprinkled occasionally. When the flowers open omit the sprinkling, and admit as much air as may be without lowering the temperature. When the fruit has set more water will be required. All deformed fruit is to be picked off, and that which is perfect is to be thinned, if more has set than can be well ripened. As the

Fig. 2.—FRENCH FORCING PIT.

fruit ripens the house should be kept dry and well ventilated to perfect the flavor. In the absence of a house the pots may be placed in a hot-bed composed of a thick layer of dung and leaves, the intervals between the pots being filled with moss. The proper temperature is to be maintained by ventilation, and if the heat falls, as it is likely to do, linings of fresh manure are to be placed around the bed.

The Management of House Plants.

Some of our correspondents think we should give more attention to those plants that are cultivated in dwellings. Perhaps we have of late neglected this branch of horticulture, and will endeavor to make amends. There are two ways in which people go wrong in starting their stock of house plants. Some wait until winter has fairly set in, then, thinking that some plants would make their rooms look more cheerful, go to a green-house and procure a lot of nice, healthy looking subjects, being careful to select those in bloom, or at least well furnished with buds. The plants are taken home, and in two or three weeks they are sorry looking things, the buds have fallen, the leaves are withered, and the whole in a bad plight.

The plants in their transfer have been placed in totally different conditions as to heat, light, moisture, and almost everything essential to their growth. Some will worry through it, and after a severe struggle, accommodate themselves to the change, while others will succumb. Another mistake is made by those who have plants in the borders during summer, which they expect to keep in the house in winter. The plants are left out until the occurrence of light frosts give notice that cold weather is at hand, then they are hurriedly potted, and taken at once into the house. Very few things will stand this treatment. Plants in being lifted, however carefully, will have their roots disturbed, and more or less broken, and it takes them some time to recover; they should be taken up while there is yet growing weather,

carefully potted, and pruned to diminish the evaporating or leaf surface, and shaded a few days until they recover. When the plants are taken indoors, put them in a room without a fire where they can have plenty of air on mild days, and thus be gradually habituated to their change. The general treatment of the plants we will defer until later, and enumerate a few things that almost any one can succeed with. If we could have but one pot-plant it would be Ivy; to be sure it does not bloom, but its rich green is better than many poor blossoms. It grows with the greatest ease, will stand all kinds of abuse, though it well repays good care.

The *Calla* (*Richardia* *Ethiopica*) is of easy culture and fine in foliage and flower. Chinese Primroses are good window plants. The seed should have been sown in spring, but plants may be had of florists. Among the things that are kept by all dealers in green-house stock, those that occur to us as doing well in ordinary house culture besides the above, are: *Cypripedium ignea* (wrongly called *C. platycentra*); *Geraniums*, especially the Sweet-scented, and the Ivy-leaved; Chinese Roses; *Epiphyllums*, often called Crab's-claw Cactus; *Ageratum*; *Cyclemus*; *Verbenas*; *Petunias*; *Wax Plant*; *Heliotrope*, etc. These are all plants of moderate height; among the taller shrubs of house culture are *Orange*, *Lemon*, *Myrtle*, *Pittosporum*, *Abutilons*, *Daphne Odora*, *Laurestinus*, and with special care, *Camellias* and *Azaleas*. Among annuals, which may be raised from seeds sown at once, are *Mignonette*, *Candytuft* and *Nemophilas*. The plants should be thinned to three in a six inch pot. Several of the bulbs may be flowered in the house; these are to be potted as described in the article on bulbs. The list of house plants might be much increased, but more are enumerated above than any one person would be likely to grow. Many who have quite a stock of window plants have raised them from cuttings, or slips, which have been given them by friends. To the real lover of plants those thus raised from the beginning are inexpressibly more valuable than any that can be bought. With many house plants, it is an easy matter to grow them from cuttings; if slips are put into light soil and not exposed to the sun for some time, they will take root and grow. Others require more care; the cuttings need to be covered with a glass; a jar of some kind or a glass shade will do. This should be removed and wiped every day, and as the cuttings begin to grow, lift the edge of the glass and give more air. *Camellias*, *Azaleas*, and such things, it is useless for the amateur to try to propagate. The general and especial management of the leading plants will be treated of another time.

Hardy Bulbs.

Under the head of hardy bulbs come the *Tulip*, *Hyacinth*, *Crocus*, *Crown Imperial*, *Lilies*, etc. These may be grown as florists flowers, the choicest varieties selected, cultivated with the greatest care, and, except the *Lilies*, taken up each summer and replanted in autumn; or they may be grown as everybody's flowers—planted and let alone for several years. The tulip or hyacinth fancier needs no directions from us. To those who have never cultivated bulbs we say, do not bother with the catalogues; send to a dealer of good reputation the sum appropriated to bulbs—tell him you wish the best for general culture, of assorted colors, and you will be much better served in quantity and quality than if particular varieties were speci-

fied. When the bulbs are received, lose no time in planting them. They may be in separate beds, or in clumps in the borders. Deeply spade the soil, which is all the better if sandy, or trench it, working in a plenty of old cow manure, and plant, the distance apart and the depth being governed by the size of the bulb. Hyacinths may be put 8 inches apart and 4 inches deep; tulips a little less. Crocuses should be 2 inches deep and about the same apart, Lilies, according to their size, one to two feet apart, and four inches deep. The bed when planted will be a little above the general surface, but will settle during the winter. When the ground is about to freeze, throw a covering of straw manure or other litter, over the bed, which is to be left until spring. Besides the bulbs enumerated above, the Scillas, Snow-drops, Bulbocodium, Narcissus, Jonquils, and hardy Gladioluses, are to be similarly treated, and to be planted at a depth proportioned to their size. These bulbs may be grown in pots, but they must not be hurried. To get them to bloom well the bulbs must be well rooted before the bud pushes to any great extent; to this end they must be kept dark and cool, but beyond the reach of frost. Prepare a light, rich soil of good loam and cow manure, and if not light, add sand. Place an inch or so of broken crock in the bottom of the pot, and put in the soil and pot the bulbs, which in the case of Hyacinths and Polyanthus need not be more than half covered. Place the pots in a cool, dark cellar, or make a rough frame of boards to contain them, and cover with several inches of coal ashes or tan. It is safe to invert a small flower-pot over each bulb, before putting on the ashes or tan. The object of this is to prevent breaking the bud in uncovering, in case it should have started. In about six weeks the pots may be brought into a warm room. The bulbs may also be grown in boxes.

Laurels and Hollies from the Woods.

The past summer we saw in the grounds of Mr. A. S. Fuller, Ridgewood, N. J., some remarkably successful attempts at transplanting Laurels or Kalmias. Plants four or five feet high, taken from the woods this spring, were making a vigorous growth. As Mr. Fuller is one of those who have no horticultural secrets, we learned how it was done, but as the treatment was original with him, it was proper courtesy to allow him to make it known. As he has published his method in the Horticultural Recorder, we feel at liberty to commend it to our readers. In early spring the plants are taken up with as little injury to the roots as possible, and every branch is cut back about half its length; they are set out, and if dry weather comes on a mulch is put over the roots. This treatment removes all the foliage from the plant and leaves a most unpromising looking stick. Have patience and the stick will "break" in an astonishing manner, and put forth an abundance of shoots which will form a good head by autumn, and probably flower the next year. The Laurel (*Kalmia latifolia*), one of the most beautiful of the broad-leaved evergreens is rare in cultivation—the uncertainty attending the removal of good sized shrubs having discouraged planters from the attempt. True, plants may be had at the nurseries, and imported at that, but they are so small that one must wait many years before they get large enough to be enjoyed. In looking over some manuscript of the late Wm. N. White, of Georgia, we find that he had hit upon the same treatment for our

native Holly (*Ilex opaco*). He states that by removing all the leaves the plants may be got out with success. A holly hedge would be both a barrier and an ornament; the slow growth of the plants raised from seed and the difficulty of removing large ones in the ordinary way, have deprived us of the services of a plant that every lover of hedges has wished to use. We hope that our friends in the Southern States where the Holly abounds, will try this treatment and report the results.

Horticultural Wonders.

It seems that we are not the only editors who are asked to explain phenomena which have no existence. The editor of the London Journal of Horticulture received such minute accounts of a remarkable freak of nature, a cluster of apples growing on a plum tree, that he made arrangements to go a hundred and fifty miles to see it. Before he started he heard from another correspondent, who had investigated the matter by means of a ladder, and found that a branch of shrivelled apples had caught in the plum tree or had been placed there by design. These wonders are easily unravelled by one who does not want to be deceived. Near Lake George, a remarkable tree is pointed out to travelers, the stage stopping to let the passengers see the phenomenon of a tree half elm and half maple. Any one of ordinary perception can see that two seedlings started side by side, and crowded one another so closely as to apparently form one trunk. The application of proper force would show that there is not the slightest union between them. A large gall has appeared on the grape vines in unusual abundance this year. It is an inch or more in diameter, and looks not unlike a small green apple. Upon being cut open it shows the grubs of the insect which made it nicely encased. This has been sufficient foundation for the story of a hybrid between the apple and the grape. A vine growing over an apple tree happened to have these galls, and without investigation people who ought to know better, promulgated the wonder of a hybrid of the apple and the grape.

An Enemy to the Wistaria.

Early in July we found that the Wistarias had been attacked by some insect which cut the leaves and turned over a flap, as shown in figure 1. Upon returning after an absence from home of a few weeks, we found the vines almost entirely stripped of foliage, and upon examining the few remaining leaves, we found our enemy much grown and snugly hidden in a shelter made by drawing two or three leaves together by means of strong silken threads. Reference was had to

FIG. 1.—WISTARIA LEAF. Harris' Insects, and it was found that we probably had to do with the Tityrus Skipper. (*Eudamus Tityrus* of Fabricius; *Gonoloba Tityrus* of Doubleday.) The larva, fig. 2, is about 2 inches long, of a yellow-

ish green, with darker transverse markings, and a chocolate colored head, upon which are two large yellow spots looking like enormous eyes.

The caterpillars are

not seen by day, as they remain quietly housed, but they are active enough after dark, and one, by examining the vines

FIG. 2.—CATERPILLAR.

with a light, will see the leaves disappearing at a most alarming rate. The caterpillar transforms to a chrysalis either on the vine or in some secure place, and in the following summer appears as a very active butterfly, which is from 2 to 2½ inches across, with brown wings. The first pair of wings has a semitransparent band across them, and the second pair is marked with a broad silvery band on the underside. This insect is described by Harris as being particularly destructive to the Locust. There are other nearly related species which have similar habits, and ours cannot be absolutely identified until we hatch the butterfly. As the larvæ are so perfectly sheltered it is not likely that any applications would destroy it. It fortunately manifests its presence before much damage is done, and can readily be disposed of by going over the vines and pinching the leaves wherever they are folded, as shown in figure 1.

A Rose with Single and Double Flowers.

A correspondent sends us a drawing and an account of a rose-bush, one portion of which produces single and the other double flowers. This is an instance—by no means rare—of what the gardeners term a "sport," and what Mr. Darwin in his work on "Variation of Animals and Plants Under Domestication," calls "Bud Variation." In this remarkable work are collected numerous cases of this kind, and the subject is discussed at length. That plants vary from seeds is well known to every one; a bud is in a manner an individual embryo plant, a highly developed seed, so to speak. The bud can be removed from the parent plant and he inserted in another and grow, and in some instances it will grow, if put into the soil, like a seed. The branch produced from a bud sometimes produces a growth quite different from the plant from which it springs, and presents distinct characters, which may be perpetuated by cuttings. In this way some of the choice florist's varieties have been obtained with the rose and many other plants. A white moss-rose has produced a red one, and a moss-rose has, by bud variation, given roses totally destitute of "mossiness." The well-known rose Saffrano, in this way produced the more beautiful Isabella Sprunt. We have given instances in these pages of some remarkable variations in grapes, and some of the beautifully variegated Pelargoniums are sports from other varieties. Peach trees have produced nectarines, and certain branches of cherry trees have borne fruit ripening much later than the rest on the tree. These things are not common, but sufficiently frequent to be of value to the florist and pomologist, and we hope our readers will communicate any such instances as fall under their observation.

BOXES FOR PROTECTION.—A box made by tacking boards together, open at both ends, and of a height proportioned to the plant to be covered is often useful to protect tender things in winter. It is put over the plant and the open spaces filled with salt hay or other elastic material.

Treatment of Lawns and Grass Plots.

Many people think that the one thing requisite to produce a good turf is to sow a particular kind of seed. There is, to be sure, a choice in grasses, and we have in former articles indicated our preferences. But whatever kind of grass is sown, good keeping will tell. Frequent rollings and mowings with occasional top-dressings will make a good turf with most perennial grasses. The roller is an important implement in keeping a lawn in order. Where the mowers are frequently used this is not so necessary, as these implements have a roller attached; but where, as in many places, the mowing is done by a scythe, the roller must be brought into use. Every person who crosses a lawn makes the surface uneven; where a path is worn, it is a pretty sure indication that a walk is needed, and it is best to make one at once. Promiscuous trampling of a piece of grass, large or small, especially if just after rain, leaves it in a bad condition for mowing, whether by machine or by hand. Wherever hand mowing is practised, roll the grass the day before. This removes all inequalities of the surface of the soil, and the grass will recover during the night and be ready to take the scythe. Many perennial grasses, as well as the clover, form a turf by throwing out runners, which root at the joints. If the lawn be mowed without rolling, much will be cut off, which, had the roller been used, would have been pressed into the soil and taken root.

Large lawns are really easier to manage than grass plots, such as we find in village and town yards. With these last the mowing is often delayed and the stronger varieties of grass, or if the plot is all of one kind, the stronger shoots, smother the weaker. Let any one mow a neglected lawn or grass plot and he will find, if he mows as he should, within an inch of the soil, that the remaining leaves of grass are all dead and that the runners have but little hold. It would be in most cases impracticable to use a roller on small grass plots. These can be levelled by the use of the Turf Beetle. The shape of the implement is shown in the engraving. It is a piece of 3-inch plank of a length and width proportioned to the views of the operator. We use one about 3 inches thick, 10 inches wide, and 1½

foot long. It is operated like a pavior's rammer, and one, after a little practice, can make a grass plot smooth and level. Where the plot is small a grass-hook, a sickle without teeth, is used in preference to a scythe. Weeds will establish themselves if not pulled while young. Thistles, plantains, and other coarse weeds are easily removed while small. Barn-yard grass or Cock's-foot (*Panicum Crus-galli*), is apt to appear late in summer, and be troublesome. It is a coarse annual, making clumps of such vigorous growth that it kills out the finer grasses near it. It should be pulled up as soon as it can be distinguished.

TURF BEETLE.

The implement here figured is useful in laying turf, as by its aid not only a level surface may be secured, but the roots of the turf will be brought into close contact with the soil below.

STARRY SCABIOUS.—(*Scabiosa stellata*.)

Winter Bouquets.

Bouquets of Everlasting flowers, as they are called, are pleasing or the reverse, according to the care that has been given to collecting and preserving the flowers, and the taste displayed in making them up. Most of these unfading flowers bloom late, some, such as the Helicrysums, coming into perfection just at the time of hard frosts. With the majority of these plants it is best to pick the flowers before they fairly open, remove the leaves from the stems, tie them in small bundles, and hang them, flowers down, to dry in the shade. If too many are put together there is danger of mildew, and it is moreover difficult to keep the stems straight. The Globe Amaranth (*Gomphrena*), should not be picked until the heads are well developed and feel papery. If in making up, the natural stems are not manageable, or if the flowers become broken off, as they are apt to be, artificial stems made of slivers of broom corn may be attached by means of a thread or fine wire. Seed-vessels of various kinds are introduced into these bouquets with good effect. A species of Scabious (*Scabiosa stellata*), is sometimes cultivated for his use, under the name of Starry

Scabious. We saw this old but not very common plant some time ago in the garden of Mr. Vick, at Rochester, and were so pleased with its appearance in fruit that we had an engraving made of it. Each seed-vessel is surmounted by an expanded and prettily marked calyx, and which holds its shape and beauty when dry. It is an annual and may be readily raised from the seed.

A NEW LAWN PLANT—Or rather an old and well known plant put to a new use. In France it is found that the common Yarrow or Milfoil (*Achillea Millefolium*) makes an excellent lawn. With us it occurs abundantly as a weed. That it will make a lawn is asserted on good authority, and such is its hardness that it will grow in places too dry for grass to flourish well upon them. We are assured that in the city of Paris there are velvety lawns made of this plant which have remained of a fine green through a drought of two month's duration. We hope that some of our Southern readers will try it. Nothing is said of the time of sowing, but we presume it may be sown in fall or spring as most convenient. The seed is already or soon will be ripe.

The Movements of Plants.

That plants possess the power to move spontaneously, is well known to those who have watched those flowers and leaves which go to sleep at night and wake up in the morning. The spontaneous movements of climbing plants have been illustrated in a former volume, and the Sensitive Plant affords a marked illustration of rapid motion when irritated by the touch. More striking than these, because more rarely witnessed, are the singular ways of the Moving Plant, *Desmodium gyrans*, a native of the East Indies. A friend who was so fortunate as to raise some plants from seed, sent us a specimen, the motions of which have been watched with great interest. The engraving shows one of the leaves of half the natural size. It is a compound leaf, with one large terminal leaflet, and two small lateral ones. When the weather is sufficiently warm, the smaller leaflets will rise and fall by perceptible jerks, and at the same time perform a gyratory movement, while the larger leaflet will occasionally turn itself as if to see that the little fellows are doing their duty. This movement continues day and night, sometimes with only one leaf, then with several, and does not seem to depend upon any external condition, other than that the plant shall have sufficient heat for its healthy growth. What purpose is served by these motions, or how they benefit the plant, is not easy to see. The plant is sometimes called *Zedysarum gyrans*, but the best authorities place it in *Desmodium*, of which we have several native species, with adhesive seed-pods, known as Tick-Trefoils.

MOVING LEAF.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Sea-side Fare—The Quahog—(Round-clam).

As stated last month, the Quahog of New England is called Clam, or Round-clam in New York, and southward. Quahog or Quahang, is an Indian word, and we like to see the aboriginal names preserved; besides the animals are so unlike that it is absurd to call them both clams. Figure 1 gives the shape of the shell, which is quite different from that of the clam given last month. While the shell of the clam is thin, this is thick and very flinty. In some localities the shells are nearly white, but generally they are bluish or lead-colored. Qua-

the liquor for a portion of the soup. Placing over a brisk fire and roasting in the shell, like oysters, is a favorite way of cooking with many. Young and tender Quahogs make a delicious pic. They should not be larger than an old-fashioned penny when boiled out, and be made into a savory pie with the addition of salt-pork, seasoning, and sometimes veal is added. Chopped and mixed with a batter of flour and eggs, they are fried in fritters, or in crumbs, by dipping first in egg and then in finely powdered cracker, and frying quickly to a nice brown. Quahog chowder in New England, (clam chowder in New York), is a dish of great repute, and each chowder maker thinks he can make it better than any one else. It seems to be one of the few forms of cookery in which a gentleman may indulge, and many a one well known in commercial or professional life prides himself on his ability to make chowder. The essentials of a chowder are quahogs, pork, potatoes, hard-bread, and an old-fashioned iron pot, with a close fitting cover. Other things may be added, but these are essential. Place slices of fat pork in the pot, and slowly fry it until rather crisp, and then take it out, put in some quahogs (clams), a layer of sliced potatoes, some broken hard bread, and some of the fried pork, cut in small pieces, using pepper at discretion, go on with alternate layers in the same order, until enough has

The sliced roots may be used for flavoring soup, or peeled and sliced they may be stewed until tender, and served with cream, salt, and pepper, or a sauce made with flour and butter. Boiled whole and sliced when cold, it is excellent dressed as a salad.

TOMATOES, though not among the less known vegetables, are capable of being cooked in so many ways that we must notice them in their season. Many prefer them simply peeled and stewed, with plenty of butter, but cooked only just enough to fairly heat them through. Others stew them, rub them through a sieve, and stew again until reduced to a thick pulp. We like both these ways; they give two distinct flavors. The last mentioned manner of cooking gives a rich sauce to serve with meats of any kind. But we wish to give some of the less common modes of cooking tomatoes. Peel the fruit, cut it up and let the juice drain from it; put into a buttered pan with bread-crumbs, butter, salt and pepper, and bake for half an hour in a quick oven. This is called scalloped tomatoes, and if tried once, will probably be repeated. Broiled tomatoes are relished as a novelty. Cut large ones in two cross-wise, put them on a gridiron, cut surface down; when well seared, turn, put a lump of butter, with salt and pepper on each one, and cook with the skin side down until done. Baked or stuffed tomatoes are excellent; large fruit is required; wash and wipe each one, and with a sharp knife cut out a good sized plug at the point where the stem was attached, being careful not to cut through the lower surface. This cavity may be filled with a lump of butter, a mixture of butter and bread crumbs, using salt or pepper, or with any kind of meat chopped very fine, highly seasoned and mixed with plenty of butter. Put the tomatoes thus prepared in a pan and bake for half an hour, or until well browned.

Fig. 1.—THE QUAHOG—(*Venus mercenaria*.)

hogs are found on muddy bottoms, on or near the surface, and are taken by rakes or by "treading out." The fishermen wade at low tide and pick them up as they are felt by the feet. When opened, the appearance, figure 2, is very different from that of the clam. The snout is inconspicuous, the "belly" or body is the most prominent part, and to this is attached a somewhat triangular appendage, the foot, by the use of which the animal is enabled to slowly move from place to place. The drawing is taken from a boiled animal, as the parts show more distinctly than in the raw one. Quahogs differ in size from that of a half dollar to nearly as large as one's fist, and like oysters and other shell fish, their tenderness and flavor differ with age and locality. Being in season when oysters are not good, great numbers are eaten raw. The modes of cooking are various; a primitive shore style is to wash the shells thoroughly, put them into a pot without water, and cook until the shells have opened. A considerable amount of water is contained within the shells, and is given off in cooking. The animal is then readily picked out from the shell, and

been put in the pot. Add water, in which a little flour has been stirred, enough to cover the materials, (do not use too much thickening), cover the pot and cook slowly until the potatoes are done. This is the general outline which admits of variations. The quahogs, if large, are cut in several pieces; some pour out the pork fat and substitute butter; onions thinly sliced, are often used; a red pepper broken up is an essential ingredient with some; tomatoes are sometimes added, and wine even forms a portion of the compound. No definite rules can be given for making a chowder—it being a dish that allows for a display of art—but however made it is a most savory and popular compound.

The Cooking of Vegetables.

CUCUMBERS to most people are only known as a vegetable to be eaten raw with vinegar, and whatever other condiment may be liked. The writer happens to be fond of them cooked, especially fried. Cucumbers grown rather too large for eating raw are the best. Pare and slice lengthwise, dip in batter or in egg, and then in pounded cracker, and fry as directed last month for egg-plant. We have eaten stewed cucumbers, but never cooked them. A correspondent at Shawnee Town, Ill., sends the following way of doing them, with the remark that cooked thus, they are more palatable and healthful than when eaten raw. "Pare and slice 2 or 3 common sized cucumbers, put them in a shallow vessel with half a teacupful of water, which has previously been seasoned with salt and pepper, stew them until soft; then add a large spoonful of fresh butter, or fried meat gravy, not lard, also 2 or 3 large spoonfuls of rich, sweet cream. While stewing, the vessel should be covered and stirred occasionally. Try it." Others use equal parts of cucumbers and sliced onions, fry them first in a little butter and then stew, seasoning with cayenne pepper.

CELARIAC OR TURNIP-ROOTED CELERY.—This is a variety of celery with a large root, and is found in our city markets wherever there is a large German population. It is altogether too good a thing to be confined to the German or any other people, and those who like celery at all will do well to grow it, as it is less trouble than the ordinary kind.

A Handsome Flower Stand.

At one of Mr. Whitlock's weekly exhibitions, a stand was presented by Mr. C. L. Allen, Florist of Brooklyn, N. Y., that was noticeable not only for the beauty and tasteful arrangement of the flowers it contained, but for the workmanship of the stand itself. Rustic stands are often coarse in mate-

Fig. 1.—FLOWER STAND.

Fig. 2.

Fig. 2.—QUAHOG OUT OF THE SHELL.

may be eaten with whatever seasoning is fancied. This is a ready method of opening Quahogs to others in other ways. To open them raw, a blunt knife is placed where the shells meet, and is struck a smart blow with a stick; the muscle which holds the shells together being severed they spring apart, and the animal may be taken out. Soup may be made of Quahogs opened in this way, in the same way that oyster-soup is made; with milk, butter, pepper, and thickened with cracker. A much richer soup is made by boiling out the Quahogs as above mentioned, chopping them fine and using

rial and in construction; this, while it has much the effect of rustic-work, is neat and more in keeping with the furniture with which it would be surrounded in the parlor. Figure 1 shows the stand as it appears when empty. Above is an octagonal box which contains a zinc pan that may be filled with earth, and used for growing plants, or may serve to hold cut-flowers. When used for the last named purpose, a convex zinc cover is placed over

the pan; this is perforated with numerous holes through which the stems of the flowers are thrust. The pan in this case, of course, contains water. Below is a wire basket which can be lined with moss, and hold a pot of Ivy, the stems of which may be entwined around the legs of the stand.

Fig. 3.—TOP OF STAND.

The legs are of the shape given in fig. 2, A; they are first sawed out of a black walnut plank, and then worked into a rounded shape by use of the drawing knife, spokeshave, or even a jack-knife. The shape of the curved cross pieces near the bottom of the stand is shown at B, figure 2. After the pieces are rounded, a "rustic" appearance is given to the work by lining it with shallow grooves by means of a small gouge, such as is used by wood-carvers. The whole is finished by oiling it with linseed oil. When the stand is not occupied by flowers, Mr. Allen converts it into a useful article of furniture by means of the circular top, figure 3. This has a projection to fit into the upper part of the stand in place of the zinc pan. Any one who is at all handy with tools can readily make this really pretty article of furniture from the engravings we have given.

Household Talks.

BY AUNT HATTIE.

Almost every housekeeper fancies that her way of making pickles is the best, at any rate, I for one must plead guilty to the charge, for certainly I do think my mangoes and the way I manage my 6-gallon churn crock cannot be beaten. Some few years ago, I came across an old-fashioned churn which suited my ideas of a pickle crock admirably, as it was tall and narrow. The lid was lost or broken, and it was chipped a little on the bottom, but did not leak, however. Being useless as a churn without a properly constructed lid, the storekeeper made a reasonable deduction from its original price. It has always been my mango crock, having been full every fall and invariably empty every spring.

About the time of early frost, I take every muskmelon I can find of suitable size and kind. The smaller, greener, and smoother skinned, the better. I never use those larger than a goose egg, nor any rough skinned ones. For materials for stuffing I procure a quantity of small, round, green tomatoes, two or three heads of cauliflower, as many small cucumbers as possible, radish pods, nasturtiums, and carrots, in fact, any kind of vegetable that will make pickle, including small button onions.

From each melon I cut a slice or square, according to fancy, and take out the pulp and seeds, reserve the lid with each, and set on one side until all are done; then I stew the tomatoes, peel the onions, and cut the cauliflower into small branches leaving a head to each little stem, scrape and slice the carrots, etc. When all are done, place a few melons on the bottom of the crock, filling in the spaces with the prepared ingredients, and so on until the crock is full. By using a little care in preparing, a less quantity of brine will be needed; this will apply also as regards vinegar. To two gallons of boiling water add a pint and a half of salt and a piece of alum as large as a butternut, and as soon as dissolved pour over the mangoes and let them stand three or four days, when they will be ready to finish. During this time I make ready the spices and vinegar needed. A darning needle and white darning cotton will be needed to secure the lid of each mango, after it is filled. Then I shall want 6 quarts of the best cider vinegar, $\frac{3}{4}$ of a lb. of mustard seed, 2 ounces of allspice, $\frac{1}{2}$ an ounce of nace, a root or two of ginger, green is best, two or three peppers, and a table-spoonful of pounded alum. I reject cinnamon and cloves, from sour vegetable pickle, and reserve them for sweet fruit

pickle—there is method in all things, even in pickles. In five days at the longest, take the vegetables from the brine, wash in clear spring water, and let them drain an hour or two; then fill each melon with a pleasant variety, such as an onion, a piece of cauliflower, a cucumber, a small tomato, a slice of carrot, and one teaspoonful of mustard seed, adjust the proper lid, secure it with the needle and thread, and fill each one in the same way. When all are filled, put a few on the bottom of the crock with the lid uppermost, and fill the spaces with any ingredients remaining over, and so on until the jar is full. Boil the vinegar with the alum and spices before mentioned, and any mustard seed not used in the filling, and pour boiling hot over the whole, and they are ready to put away for winter use. Do not tie the spice in a bag, but allow it to arrange itself among the mangoes. This pickle will keep any length of time the family will allow.

It may be thought of savor of vulgar taste, but I assure you that every one of our household, Edward especially, is fond of pickled onions, and it is an invariable rule with me to do up a bushel and a half every fall; and I have never found that quantity more than enough to supply our wants. In former years it has been a serious matter to get such a quantity in proper condition for pickling, and many were the tears shed over the jacket stripping process, but I am happy to say that tears and stained fingers as respects onions, are things of the past, for they are quite unnecessary. With a sharp knife, cut off neatly the top and bottom from each, and throw into a tub or crock, and pour over them a boiling lye made of wood ashes. It should be as strong as possible. Most of the skins will come off immediately. I have never repeated the process, but I suppose if the first lye was removed, and fresh poured over, no further trouble would be needed; as it is, with me it has been necessary to use a knife in removing some of the skins. They should be well washed from the lye before handling. When ready, pour over a little stronger brine than that used for the mangoes, say 1 quart of salt to two gallons of water, without alum. Let them stand a week, when they may be washed and drained for a few hours, and boiling vinegar poured over them, spiced as for the mangoes, or if more convenient, with red peppers alone, as they are really a spice in themselves. Do not forget to add the alum, however, as it is necessary to restore them to their original crispness. The middle of October is the best time to make this pickle.

I have also a 3-gallon crock known by the name of the pear jar. It is devoted to a sweet pickle, made of pears, seasoned with sugar, vinegar, cinnamon, and cloves. Just before pears are fully ripe, I peel the desired quantity and boil until tender in a syrup made to my taste—say one and a half to two pounds of sugar to one quart of vinegar. I boil a few at a time, and when all are done, cover with boiling syrup and put away for use.—My 4-gallon peach crock is filled nearly every fall with peaches done very much in the same way as the pears. I sometimes omit to peel them, in which case I insert 3 or 4 cloves into each. But little prepared syrup is necessary, as a great deal of juice is formed from the peaches themselves.

Yes, quite an array of crocks, but then not half as many as used in some families. Here is the ripe tomato crock, the small cucumber, the mango, the onion, the peach, the pear, the preserved lb. for lb. damson crock, the plum pickle, and the large green cucumbers stuffed and pickled exactly as the muskmelons; they are nearly as good, some prefer them. The higgdom jar, the pickled cherries, and here is the ripe cucumber sweet pickle, and the ripe watermelon rind, both made alike, the latter the nicer, however, as it is more tender and of better flavor. But I must tell you how to make it as it is excellent, but I did not show you my stuffed large peppers, or my green tomato mangoes, both filled with sliced cabbage seasoned with mustard, and then my sliced green tomato and onion, just the season for making it now as the frost, if there is any, does not injure the tomatoes materially. But enough—let us go to the melon pickle. Take the rind of ripe watermelon, peel

and cut into slices, and pack in a jar, pour in over them a little vinegar or salt and water. I prefer the vinegar. In 24 hours, boil until tender in a syrup made of 2 lbs. of sugar to one quart of vinegar spiced with cassia buds or cinnamon and cloves as preferred. Boil a few only at a time, and when all are done, pour over the remaining syrup. If not enough to cover well, make a little more.

Higgdom is made of vegetables—generally green tomatoes and onions chopped fine, and salted for a few hours. Drain thoroughly and place in a jar. Pour over boiling vinegar, spiced with mustard, allspice, and peppers; strain before pouring over.

A Neat and Durable Tidy.

An engraving is here given of a tidy which is easily made, is very pretty when done, and which can be washed and done up to look as good as new. The materials required are spool cotton thread, No. 12, and a frame 14 inches square, which can be readily made of half-inch strips. Upon the outer edge of each side of the frame are cut

Fig. 1.—THREAD TIDY.

twenty notches, half an inch apart, beginning two inches from the corner. At each of these notches the frame is wound with thread, using from ten to fifteen turns, as the tidy is wanted heavier or lighter. When the frame has been wound in one direction, then wind the cotton in the same manner the other way. If the notches have been properly placed, the threads will cross at right angles, dividing the body of the tidy into squares.

Fig. 2.—PORTION OF TIDY.

Then take a needle with doubled cotton and tie the crossed threads, as is shown in figure 2. Commence at one corner and tie the thread fast, pass it diagonally across the square, pass the needle around the threads where they cross and tie a single knot. The whole is to be tied over in one direction, and then in the opposite. Figure 2, which shows some squares of the natural size, will enable the construction to be readily understood. When all the tying is done, cut the threads where they pass around the frame, and the fringe is formed. After washing and starching, it should be stretched in shape and pinned out to dry. It is not to be ironed.

HERBS FOR WINTER.—Tying aromatic herbs in bunches, and hanging them in a garret or other place until needed, is not the best way to keep them. After drying, place the herbs near the stove for a short time, remove and cool, when they can be rubbed to a moderately fine powder between the hands, leaving only the useless stems. Keep the powdered herbs in well stopped bottles properly labeled. Every housewife should have sage, thyme, summer savory, and sweet marjoram.

BOYS & GIRLS' COLUMNS.

The "Philosopher's Stone."

It was long supposed that gold could be made by art. Some of the wisest men spent large fortunes and devoted their whole lives in trying to discover the process. They hoped to acquire enormous riches by fiddling out the secret. Their belief was that all metals are made of nearly the same ingredients, that silver and gold contained the same elements as iron and lead, but freed from impurities. Those engaged in seeking the art of transmutation, as it was called, were named alchemists. The substance by which they hoped to effect the change from the base to the finer metals they described as the "Philosopher's Stone." Many curious anecdotes are related concerning the alchemists. It is said that a certain king in India, who believed in alchemy, was marching with his army across a shallow stream, and that when all had passed, it was discovered that one of the fetters on an elephant's foot was changed to gold. It was immediately concluded that the "philosopher's stone" must be somewhere in the stream, and coming in contact with the iron, it had made the wonderful change. The king, hearing of the occurrence, at once halted his army and had a large ditch dug above the place, to carry away the water, so that the bed of the stream could be searched. When it was laid bare, men were employed to pick up the stones found there and rub them upon a piece of iron. As fast as they proved worthless they were cast away into the water beyond. They worked this way for days, and it said they became so accustomed to giving a rub and a throw with each stone, that although one fellow came across the very stone they were seeking, which turned his iron into gold, yet away it went with a jerk, like the rest, from mere habit, and although they spent a long time in searching for it, it could never be regained. If the author of this fable meant to teach that we should be careful not to throw away opportunities lightly, lest a golden one slip by unobserved, he conveyed some truth by his narration. Several stories are told of strangers appearing in various places, and after successfully performing the experiment of changing lead into gold, leaving with the promise of coming back in a short time; but there is no account of the promise ever being kept. Here, again, the truth seeker will discover at least a golden maxim, not to trust to promises when present performance is possible. Many tricks were played off by impostors on those who believed in alchemy. Sometimes they used a melting pot with a false bottom; at the real bottom they placed a quantity of gold or silver, or some of their compounds. The melting pot being placed in a very hot fire, they put in a little lead, and stirring it as it melted, also broke away the false bottom. Then when the creosote was cooled, the finer metal which had been concealed would be found. Some persons still think that the time may come when the secret of gold making will be discovered, and that the alchemists were not far from right in believing that all metals are but variations of some one primary substance. Whether the theory be true or not, it is certain that the experiments and researches of alchemists have not been entirely in vain. By their means many useful chemical mixtures were discovered, and much valuable scientific knowledge gained to the world.

Pious Thieves.

Travelers in Russia state that one of the ornaments of their houses is a "holy picture" of the Madonna or some saint, which is found among all classes of the population, even to the remotest part of the immense empire. These pictures are held in great reverence, and every person entering a room containing one is expected to remove his hat and cross himself devoutly. They are rightly considered quite a safeguard, for thieves hesitate to steal where such a picture is present. Some cunning rogues, however, have managed to make their depredations and ease their consciences; several instances are recorded where houses have been robbed, but the holy pictures were carefully covered by a cloth, so that the saint might not be shocked by, or interfere with, the iniquity being done by the pious thieves in its presence.

Robinson Crusoe's Island.

"How I would like to live like Robinson Crusoe," many a boy has said after having read the interesting account of him written many years ago by Defoe. Some young readers have taken pains to look for his island, Juan Fernandez, on the map, and a few can tell something of the general character of the place at the present day. All, however, do not know these particulars; one writes to enquire about them, and for the benefit of those who would like to be informed, we give the following brief account. The island of Juan Fernandez is in the South Pacific Ocean, about 400 miles west of the coast of Chili,

to which country it belongs. It is 15 miles long and 6 miles wide, the coast being irregular, so that it contains only about 65 square miles. It is a rugged, mountainous region, but contains many pleasant and fertile valleys. Its principal mountain is nearly 4000 feet high. It is occupied by a colony of fishermen, numbering about 50 persons, who hire it from the Chilean government. The climate is very healthful, and the soil fertile, producing abundant crops of grain and fruits, such as apples, strawberries, melons, figs, etc. Valuable woods, as sandal wood, the cork tree, etc., grow wild. Wild goats abound in the rocky districts, and fish are plenty in the adjoining waters. The place is frequently visited by vessels to procure a supply of water, though we believe there is no regular line of communication. In 1704 Alexander Selkirk, a Scotchman, who was sailing master of an English privateer, was set ashore there at his own request, and remained in solitude, "monarch of all he surveyed," for five years. He was provided with plenty of clothing, arms, ammunition, etc., so that he did not suffer from want. His adventures are supposed to have been the foundation for the story of Robinson Crusoe, but there are good reasons for believing that Defoe received his idea of the book from the published account of a Spaniard wrecked on an island in the Caribbean Sea, near the mouth of the Orinoco river, where he lived alone for many years, being finally taken off by a passing vessel.

An Honest Miner.

A Cornish miner living at Camberne, was unable at one time to pay his rent, and his little stock of furniture was seized to be sold to satisfy the demand. He applied to a lady, well known in the district for her charitable deeds, for a loan of three guineas. "I know nothing of you; you may be a drunkard or an impostor," were the disheartening words that met his application. "Madam," replied the miner with energy, "I am neither, and if you will lend me the money I will return it in four months." The money was lent, the time for payment came round, and the miner who by great exertion had managed to get the money together, set off on foot to pay his debt. On his way he had either to cross a small river, or lengthen his journey three miles to pass over a bridge. He chose the former, and, calculating the depth of the water, lost his footing and was drowned. When the body was recovered, his wife said he had three guineas with him for the lady who had lent him that sum. His pockets were searched, and no money found, but some one noticed that his right hand was firmly clenched. It was opened, and there were three guineas which he had firmly held.

The Monk Outwitted.

It is related that a monk living in Peru, by his gambling practices, got into great difficulties in money matters. The native Indians in his vicinity were much attached to him, as he was of a kind and generous disposition, and they frequently sent him presents. One day, when he had lost largely in gambling, an Indian promised to assist him, and the next evening brought him a large box full of silver ore. The present was several times repeated, and the monk very naturally was anxious to discover where the precious metal was procured. He pressed the Indian so closely that at last he consented to conduct him to the mine. Accordingly one night several Indians came to his house, blindfolded him, and each by turns carried him for some distance into the mountains. At length the bandage was removed and he found himself in an opening in the rocks, surrounded by bright masses of silver, and was permitted to take as much as he could carry. While the Indians were conducting him home again blindfolded, he fastened his rosary, and dropped the beads at intervals along the path, hoping by their aid to find his way to the mine again alone. In the course of an hour or two his Indian friend knocked at his door, and giving him a handful of beads said, "you dropped your rosary on the way, father, and I have picked it up for you." This was the last visit he was allowed to make, the Indians jealously keeping the secret from strangers.

The Disobliging Clerk.

One rainy day when little was being done by the clerks at Stewart's up town store, an elderly man stepped in and asked to see some shooting. The young man behind the counter of that department, who had but recently been employed there, hid down a piece for inspection. "Let me look at another," said the gentleman. The clerk leisurely replaced the first piece and handed down another. This did not suit, and more was asked for, and as the clerk was about replacing the goods already shown, the customer requested that it be left, that he might compare it with other pieces. After several more pieces had been looked at, one seemed to suit his wishes, but to make sure of its quality he took hold of one end and carried it nearer the light. "Hold on, old man, none of that," cried the clerk, sharply; you can buy goods here

at the counter, if you want them." He did not like the trouble of folding up the goods again. "I guess you'd better step down to the cashier's desk and get what is owing you," quietly remarked the supposed customer, who was Mr. Stewart himself. "You are too careful of yourself to do business for me." There was nothing left for the indolent and disobliging clerk to do but settle his accounts and leave. The lesson was severe, and one which will probably be lasting in his own case and also in that of his fellow clerks who saw the transaction.

Arithmetical Curiosity.

Ask a friend to write three numbers, consisting of the same number of figures, no matter how many, one under the other; tell him you will add two numbers to them, and that you will inform him how much the amount will be when added, as soon as he will write his first number. For example your friend writes 87388; you immediately announce that the sum of the five numbers will be 287396, no matter what he may put down for his second and third numbers. Suppose him to write for the second and third lines 43241 and 63198; you will write under them 56478 and 96801, and on adding will find the amount previously given to be correct. Of course you must know what to take for the fourth and fifth numbers. These may always be found at once, by subtracting the figures of the second and third lines from the number nine, and setting down the remainder. The answer you can find from the first line of figures only, in this way; place the figure 2 before the first line, and subtract it from the last figure of the line. By placing the numbers given above in the form of a sum in addition, the whole working may be readily seen. Practice well so that you may go through the operation without hesitation before exhibiting, and those unacquainted with the secret will be surprised at the result.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the September number, page 337. No. 321. *Puzzle Picture*.—It brings to mind the "wall of the tide" (*deaf*). No. 322. *Puzzle Picture*.—The man can get down safely on his goose, where there is plenty of it. No. 323. *Illustrated Riddle*.—Bee-knot over our nest over loud or over shoe in ever I ask; or Be not over earnest, over loud or over sure in your talk. No. 324. *Metagram*.—Power, Power, Tower, Sower, Rower, Mower, Cower, Dower. No. 325. *Word Puzzle*.—The word is "Injustice" (*In-act-i-ty*). The following have sent in correct answers to puzzles, etc. Isaac T. McLean, Apollis Dyer, A. G. Smith, Fannie Barrett, Leah A. Meckling, Mahala Yarnum, T. T. Taylor, "Kansas Boy," Annie Clark, Albert H. Palmer, J. Milton Snyder, (as usual), James A. Johnson, Sylvester P. Hull, C. A. McCarthy, Samuel M. Edwards, Horace Elliott, Mima M. Walker, Lillie L. Mills, Sarah Dowland.

New Puzzles to be Answered.

No. 326. *Metagram*.—A word of four letters often follows horses over a fence; change the first letter it will act 1st, like the wind; 2d, like fire; 3d, like water; 4th, like a poor horse.

Brown and Brooks went out hunting Brown, killed Brooks deliberately. Was Brown guilty of manslaughter?

No. 327. *Law Question*.—A decision to it is wanted.

No. 328. *Illustrated Riddle*.—For the idle to remember.

No. 329. *Enigma*.—A certain article has one arm, never travels, goes on one foot, is intended especially for dry places, but is most frequently used in the water. It is a favorite with dancers, but not with intemperate persons.

There is said to be only a slight difference between a rye face and a bourbon face; both are quickly read.

[COPYRIGHT SECURED.]
THE PET BIRD.—Drawn and Engraved for the American Agriculturist.

A bird kept in a cage is a painful sight to any one having fine feelings. It may be well cared for, may sing sweetly and apparently enjoy its captivity, perhaps be really happy, but it *looks* like a prisoner, and that gives an unpleasant impression. But no such thought is suggested by the pet bird in the picture. Its cage is its home, not its prison. The little girl is not a cruel jailer, but a friend whom the bird loves well. It understands the kindness she has shown it, and may well feel happy in the light of such a sweet smile. Birds kept in this way, allowed to leave the cage, and made familiar by petting, are cheerful and amusing companions. To train such creatures successfully, they should be taken when young, and gentle treatment will entirely deprive them of fear. Even wild birds may be taught to confide in a friend. Those who daily scatter crumbs for their benefit will soon be recog-

nized and greeted by flocks of grateful songsters. Numerous instances have been related of wild robins, wrens, sparrows and other birds becoming attached to persons who have fed them regularly. Surely there will be more pleasure in winning the love of one bird by gentleness and kindness, than in slaughtering a hundred in wanton sport.

Unexpected Answers.

At the Home Mission in this city are gathered hundreds of neglected children from the streets, to be fed, clothed, and cared for. Occasional treats of fruit, Thanksgiving dinners, etc., are given to them by benevolent friends. On such occasions there are numerous visitors, some of whom usually address the children, and endeavor to impart wholesome truths. On one occasion, a speaker wished to illustrate the nature of *faith*. He asked, "Children,

what are you going to have soon?" "Watermelons," responded a chorus of voices. "How do you know?" "Seen 'em in the cellar," shouted the children. The speaker, who expected to hear the answer, "Our teacher told us so," and thus to show the nature of faith, found himself nonplussed for a moment, his illustration having been thus amusingly spoiled.... Another teacher endeavored to illustrate faith thus: "Children, if I should tell you that one day I saw a monkey climbing a liberty pole, would you believe me?" "Yes, sir," unanimously. "Well, that is faith; you believe me because I say it, and you feel sure I would not tell an untruth." The next day, the question was asked of the same children, "What is faith?" "A monkey climbing a liberty pole," answered a quick little boy, who had not quite mastered the idea, but had remembered the illustration.

THE UNIVERSAL CLOTHES WRINGER, WITH BOWELL'S IMPROVED DOUBLE GEAR, cannot be surpassed or equaled by any other wringer for durability, till the expiration of the patent for the "STOP GEAR," or fastening above the cogs, which prevents them from entirely separating.

Any sensible person can understand that a cog-wheel wringer, having cogs *whether at one or both ends of the roll*, which can play apart and fly out of gear when a large article is passing through, is COMPARATIVELY WORTHLESS, as the Cogs are then of no *when most needed*.

The UNIVERSAL WRINGER was awarded the Gold Medal of the Great New England Fair, took the First Premium at the National Fair at Washington, also at the State Fairs of every Northern State, and is the only wringer which ever took a first premium at the Fair of the American Institute.

Its sale (now over \$50,000 wringers) is greater than of all the other wringers combined. It is very durable and every Universal Wringer is warranted.

A supply of wringers, also of the celebrated DOTY WASHING MACHINE, always kept for shipment at Cleveland, Chicago, St. Louis, Louisville, and New Orleans. Sold by dealers generally.

32 Courtland-st., New York.

WANTED—THE READERS OF THE AGRICULTURAL COMPASSION, who are now publishing a Magazine of Rural Life, at Indianapolis, Ind. and Chicago, Ill., call the NORTH WESTERN FARMER, which is the *Handsome Farm Journal*, in America, and the *largest*, save one. It is printed on fine book paper, *splendidly illustrated*, and *handsomely bound* in Magazine style each month. This paper is just closing its third year with the widest circulation ever attained by any similar journal in the West, and with a popularity such as to insure it an immense success next year. It is *first-class original Western Magazine*, conducted by live Western men, and filled with matter from the pens of *practical writers, who understand this great section and its needs*.

Subscription only \$1.50 a year, and a copy of the *AGRICULTURAL COMPASSION* (price 25 cents) presented to each subscriber free. We also give the last three numbers of the year to those who subscribe before November 1st. **We want Agents everywhere**, and will give **better terms** than any publisher in America. Sample copies, with full particulars, subscription papers, etc., sent free to who send stamp for postage.

WHAT THE PEOPLE AND PRESS SAY OF IT.
Gen. T. A. Morris says: "It is the finest agricultural paper in America." Col. D. G. Rose says: "I unhesitatingly pronounce it to be the finest and most instructive paper of the kind I ever saw."

Gen. James S. Negley, of Pennsylvania, says: "It is not excelled by any similar paper in America." Hon. A. J. Cook, Secretary of the Indiana State Board of Agriculture, says: "It is an honor to our State, and of more value to her people than any paper now published." A. A. Graham, agent at Florida, Ohio, writes: "Yours is the most popular paper among farmers I ever saw."

Opinions of this kind—It is altogether the finest looking paper we have seen, and for ability, interest or usefulness, it has no superior in this country.—*Western Christian Advocate*.

The North Western Farmer has the highest and heartiest endorsement of any rural Journal ever published in the West, and it will *deserve it*. It has no superior East or West.—*Cincinnati Gazette*.

Now is the time to get a **Piano, Hand Loom, Sewing Machine, Dictionary**, or some other valuable premium on easy terms. Try it. Address,

North Western Farmer Co.,

57 State-st., Chicago, or
19 North Meridian-st., Indianapolis, Indiana.

PENNA. STATE NORMAL SCHOOL, gives a thorough English education. **Cheap, Systematic, Practical.** Both sexes received. Address, J. A. COOPER, Edinboro, Pa.

RILEY'S EARLY RASPBERRY—The earliest Red Raspberry known. Now first offered to the public. For history, description and testimonials, send for (enclosing stamps) our *Manual of Grape and Small Fruit Culture*. Address J. H. FOSTER, Kirkwood, N. J., who has the

EARLY ROSE potato for sale *low*, and also a full stock of Small Fruits.

CATTLE PLAGUE.

WARREN CHEMICAL MANUFACTG CO.,
Distillers of Carbolic Acid,
4 Cedar-st., New York

Manufacture and keep on hand, Carbolic Acid and Heavy Oil of Coal Tar, for disinfecting Cattle Calf and Yards, and for general use in treating the Cattle Plague, as recommended by the Metropolitan Board of Health, and Cattle Plague Commission.

AMERICAN WALTHAM WATCHES

350,000 of these Watches are now speaking for themselves in the pockets of the people—a proof and a guarantee of their superiority, and furnishing the best reason for their great popularity and justifying the preference uniformly shown them by the public.

AN EXPERIENCE of nearly fifteen years has furnished the AMERICAN WATCH COMPANY the opportunity of *thoroughly testing* all really valuable inventions in Watchmaking; and it being the sole aim of the Company to produce watches which as time-keepers would bear comparison with the very best made anywhere, they now confidently assert that the WALTHAM WATCHES have every improvement which time and experience have proved valuable.

THE AMERICAN WATCH CO. desire specially to remark that having had the refusal of all the contrivances designed to prevent damage to the train by the breakage of mainsprings,

FOGG'S PATENT CENTER-PINION was adopted for that purpose as the best, and faultless.

WALTHAM WATCHES are now supplied with Patent DUST-PROOF CAPS, protecting the movement from dust, and greatly lessening the necessity of frequent cleaning, &c., an improvement of very great value to watch-wearers whose watches are exposed to rough usage and constant wear.

THE DIFFERENT GRADES OF WALTHAM WATCHES have frequently been submitted to the severest tests to determine their time-keeping qualities, and have invariably been found thoroughly reliable and accurate, receiving the strongest endorsements from railway engineers, conductors, and expressmen, the most exacting class of watch-wearers—and a *TRACER OF FIFTEEN YEARS HAS SUFFICIENTLY PROVED THEIR DURABILITY*.

THERE ARE many kinds, grades, sizes, and descriptions of Watches made by the Waltham Company, adapted to the tastes and means of all classes; but the Company's written guaranty accompanies every watch that bears the Company's name, and should be required of every seller.

No Watches retailed by the Company.
ROBBINS & APPLETON, Agents,
No. 183 Broadway, New York.

WALTHAM WATCHES.

For a few months past we have advertised the above Watches at *extremely low prices*, and the result has been most satisfactory. Our plan has been to sell the genuine WALTHAM WATCH, in Solid Gold or Silver Cases only, and at a very small profit, giving the purchaser every opportunity of examination and comparison, and with the understanding that if the Watch does not prove satisfactory, it can be exchanged or the money refunded.

These Watches are, without exception, the most perfect specimens of fine mechanism ever produced in any country. Each and every part is made by machinery of the most delicate and elaborate construction.

Compared with foreign watches, they possess many advantages, excelling not only in principle and finish, but still more in their reliability as time-keepers. As an indication of the prices we submit the following:

Silver Hunting Watches, \$18.00
Gold Hunting Watches, 18 karat case, 80.00
Gold Hunting Watches, Ladies' size, 70.00

We often receive orders direct from our advertisement, but prefer that every one should see and try our descriptive price list, which explains all the different kinds, tells the weight and quality of the cases, and gives prices of each. This we will forward to any one on application, and it will be found very useful in making a selection.

Every Watch is warranted by special certificate from the American Watch Co.

We send them by express to any address, allow the purchaser to open the package and examine the Watch before paying, and if not satisfied, send it back, and the money can be exchanged or the money will be cheerfully refunded. Please state that you saw this in the *Agriculturist*.

Address, in full, **HOWARD & CO.,**

No. 619 BROADWAY, NEW YORK.

PRINCE & COS.
ORGANS

BUFFALO, N. Y. CHICAGO, ILL.

WALTHAM WATCHES. C. O. D.

A GREAT SUCCESS.

In consequence of the great success attending our system of selling genuine Waltham Watches to persons in remote parts of the country at less than New York City prices, we invite the buyer's careful attention to our list of prices:

Hunting Case Watch in 3oz. Silver Case, \$18.00
The same Watch in 3oz. Silver Case, 20.00
The same Watch in 4oz. Silver Case, 22.50
The same, Extra Jewelled, \$24.00
The same, Extra Jewelled, with Chronometer Balance, \$1 additional.

The Silver Cases are warranted equal to gold.
The Watches to be sent by Express, ACCOMPANIED BY THE AMERICAN WATCH COMPANY'S CERTIFICATE OF GUARANTEE.

THE BUYER TO HAVE PRIVILEGE OF EXAMINATION IN POSSESSION OF EXPRESS COMPANY.

Purchasers are requested to compare our prices with that asked for *superior* metal imitation watches, of no value, and which find a market solely because the buyers are entirely ignorant of their quality.

Address must be plainly written, and purchaser must pay Express charges.

HERALD OF HEALTH, FREE.

Those who subscribe for the Herald of Health for 1893, now, shall have the Oct., Nov. and Dec. Nos. of this year free. We are now printing so many valuable articles that no family can afford to be without it. For 20 subscribers and \$20, we send a Wheeler & Wilson Sewing Machine, \$20.00. Send for your copy at a number.

MILLER, WOOD & CO., 15 Laight-st., New York.

Extract from a Letter from J. T. KILGORE, Clinton, Dewitt Co., Texas.

August 11th, 1893.

MESSES. JAMES BUCHAN & Co.,
Gentlemen:—
"Mr. Jno. Taylor, near Yorktown, dipped 1500 head of sheep in contents of one bag. Only thing I can think of, he killed all the ticks and screw worms, healed up the sores, and generally made the flock look 100 per cent better, at a cost of about 14 cents per head. Mr. T. informed me about 150 head were in very bad condition, maimed and bruised, nearly all troubled with the screw worm, and the dipping cured up all the sores, &c. In the absence of other remedies, I have created the use of the Carbolic Soap, and now that I am out, I am literally beset with demands for it. It is the thing."
Yours &c.,
J. T. KILGORE.

MOUNT LEBANON GRAPE.—A new and valuable variety. Send for our circular of Novelties, which gives history, description and testimonials. Originated by the Society of Mount Lebanon, N. Y., and by them placed in our hands for propagation. Address J. H. FOSTER, Kirkwood, N. J. We have a complete stock of Small Fruit Culture stamps for our *Manual of Grape and Small Fruit Culture*.

B. T. BABBITT'S

ARTICLES OF EVERYDAY USE.

B. T. Babbitt's Lion Coffee,
B. T. Babbitt's Labor-Saving Soaps,

B. T. Babbitt's Saleratus,
B. T. Babbitt's Star Yeast Powder.

For Sale everywhere. Ask your Grocer for B. T. Babbitt's preparation, and take no other. I guarantee them to be PURE AND UNADULTERATED.

B. T. BABBITT,

64, 65, 66, 67, 68, 69, 70, 71 and 72 Washington Street, and 43 and 41 West Street, New York.

PROSSER RASPBERRY—Sometimes (but improperly) called *Marionette*. We warrant our stock genuine. It has all the necessary qualities to place it fully as high as the *Clark*, which is now looked upon as a standard variety. Send for our circular of Novelties. A full stock of all kinds of Small Fruits. Send stamps for our *Manual of Grape and Small Fruit Culture*. Address J. H. FOSTER, Kirkwood, N. J.

WHITE CLUSTER BLACKBERRY—A superb berry in all respects the best to make a standard fruit. Of a beautiful *Cream color*. Perfectly hardy and vigorous. For history, description, and testimonials, send for our circular of Novelties. A full stock of all kinds of Small Fruits. Send stamps for our *Manual of Grape and Small Fruit Culture*. Address J. H. FOSTER, Kirkwood, N. J.

You want Martha!

The best and most valuable white grape. As vigorous, heartier, more productive, and in days earlier than Concord. Quality best, both for table and wine. Send stamps for Illustrated Catalogue of over 50 varieties to GEO. W. CAMPBELL, Delaware, Ohio.

Any Clothes Wringer having the double friction of cogs at both ends, which can play out of gear when most needed in wringing a large lot cannot be durable. The UNIVERSAL has not objections.

EARLY ROSE,

LOW. Send for Circular. Address J. H. F. KIRKWOOD, N. J., who grows 25 acres of Small Fruit.

The Northeastern Farmer is published *six* times a year at Indianapolis & Chicago. See Adv't on

NORWAY OATS.

The experience of hundreds of reliable farmers during the past season more than sustains every claim heretofore made in favor of this grain. They have been thoroughly tested in sixteen different States, and the reports from all quarters are most enthusiastic. We shall give extracts from letters, with the full address of the writers, who can be referred to if any of the readers wish to do so. We are introducing an improvement which has genuine merit, and is of vast importance to the farming interests of the country, and we prefer to let the farmers themselves tell the story, as they have done in the following

TESTIMONIALS.

Under date of August 18th, 1883, Gen. Thomas, Lieut.-Gov. of Vermont, says: "I have seen the Norway Oats, raised by D. W. Ramsdell, growing in fields in this section, for the past three years, and I consider them far superior to any other oats in the country, for their great yield per acre, and excellent quality. The straw grows very strong, and they are not so liable to lodge as the other kinds."

R. H. Hyde, Esq., West Farlee, President of Orange Co. Vt. Agricultural Society, Aug. 4th, '88, says: "Their ability to produce more than twice as many bushels to the acre, and their hardiness and thrifty growth, rendering them much less liable to be destroyed by storms or disease, are points which no intelligent farmer can overlook. The question is decided by farmers is not whether they can afford to buy the seed, but rather, can they afford to continue to plow and cultivate their land for 23 or 40 bushels to the acre, weighing 30 lbs. or less to the bushel, when they can just as well raise 100 bushels, weighing 40 to 45 lbs. to the bushel on the same ground with the same labor?"

I can recommend these farmers as being all that you claim for them, and are glad to know that you will be able to supply them to a larger extent the coming season than heretofore."

Non, Orange Comstock, of West Farlee, Vt. Aug. 11th, '88, says: "I have this day examined some Norway Oats grown by P. R. Robinson of this place. I have lived to see 71 years, and can truly say I never saw such a splendid specimen of oats before. The heads are from 12 to 18 inches long, the meat very large and floury. Mr. Ramsdell has my best wishes for his success in an enterprise of great value to our farmers."

H. C. Pease, of Hartford, Vt., Aug. 1st, '88, says: "Having grown from seed of the celebrated Norway Oats for the last three seasons, I am pleased to add with others testimony in favor of their merits. Their wonderful productiveness at once attracted my attention from the first, being the seed of one head, which gave one unusual large bundle."

As stated of their superiority, Mr. Pease says: "I ever saw, I purchased one peck of seed of Mr. D. W. Ramsdell, proprietor of Norway Oats, at the rate of \$13 per bushel. Adding with this what I had raised, the following spring I sowed 13 quarts upon 1/2 acre of corn ground, sown broadcast, and no manure. The result was highly satisfactory, giving me 42 bushels of measured oats. Reducing this to our standard weight would give 51 bushels from 13 quarts. The whole field averaged five feet in height, and gave me heads *about* 18 inches long. I have this season a field of 14 acres which are now nearly ripe, and are certainly a sight to behold, having massive heads measuring 12 to 18 inches, and from 200 to 100 kernels to the head. As a further test I have planted one ounce (600 grains), each grain one foot apart, and as a proof of their enormous growing and spreading qualities, they now stand as thick as a mat, completely covering the ground, and stalks larger than common rye stalks. Too much rain, not he said in favor of so valuable an acquisition as the Remarkable Norway Oats."

From Col. A. R. Lansing, of Janesville, Wis. "Sir:—In the month of May last, a friend of mine, by the name of D. B. Johnson, handed me a small handful of oats—just 100—which he said he received from you, and that they were a new species of oats called *Norway Oats*, and as he was coming away from home and could not give them a trial, he wished me to experiment with them. I have done so, and would be pleased to inform you of the result. I scattered them thinly on a small piece of well prepared ground. They came up quickly, and grew rapidly, and they flourished continually to the day of harvest. They had no extra chaff, except the private seed growing in good Western soil—no disadvantage to them, and no more than a Western seed. I had no particular regard for them until by their own superior merits they commended them. I now consider them a prodigy for an oat—at least prodigious—and my attachment for them now is so great that \$100 could not purchase my harvest from the 100 Norway Oats. Now for a statement: From the 150 oats there came up 3,500 dark green stalks, which developed ripe ears. These straw with their heads at the time of harvesting stood from 6 to 4 1/2 feet in height. They resisted the winds and did not lodge, while my common English oats were laid down badly. It is my opinion that these oats would average a yield of 2.0 grains per head. I think this really a low estimate. You will now see the surprising evenness of the growth, and that the 100 Norway Oats from 100 grains. By measurement I had 20 quarts. Weight, 37 1/2 lbs. The 100 seeds were sown on 25 square feet of ground. This would give as the production of one acre over 750 bushels, although we could not reasonably expect

a proportionate yield from so large a quantity of land. But I feel almost sure I could have grown one-half this quantity upon one acre of my ground this last season if I had had the seed. I would further state that these oats have a thin shell, and a large, floury meat, and that I consider them a much nicer grain in quality than any other out of my acquaintance. I sincerely hope that you have had them long enough so you can furnish them in small quantities for our Western farmers. I will not part with one of mine. Will you please inform me how you will send these oats, and in what quantities. All who have seen mine will send you orders."

Yours truly, A. R. LANSING

From Adam Rankin, proprietor of the Premium Farm of Monmouth Co., Monmouth, Ill. "I have not measured the ground yet that I sowed the Norway Oats on, but there is about one acre. I sowed them in March, when the ground was in a fluid state, but just after sowing there came a very hard rain and washed them out some, and I did not think they could be thick enough, but after they got well started they beat anything, growing and spreading, that I ever saw. They are thicker and larger than the Surprise Oats. What can you say (the Surprise) cover the ground better than my bushels of the Surprise Oats. They are the darkest color of any oats I ever saw, and promise well now for a most wonderful yield."

From A. Caldwell, Osceola, Ill.: "The Norway Oats have a wonderful growth and yield with me, and I heartily recommend them to my brother farmers."

A. S. Meigs, Brooklyn, Iowa, writes: "These Norway Oats beat anything I ever saw in the way of oats, and I recommend them to every farmer in the West. I harvested 22 pounds from 200 seed I had of you. They ripen as soon as the other kinds."

Hon. George W. Thorne, of Rahway, N. J., says: "To increase the yield even a small per cent. would be regarded as a success, but to more than double the crop at once, as I believe we may do by using this seed, is an advantage which we cannot afford to overlook."

From Rev. M. P. Bell, Norman's Mill, Albany Co., N. Y.: "The growth of straw was about five feet, heads very large and full, *split from one pint, three bushels*. They ripen as early as my common oats. I can recommend them to every farming world with confidence. The man for whom I sent for a pint at the same time sowed them side by side with common oats, which I did not do until the Norway Oats were eighteen inches, while the Norways stood up four feet and headed out at a wonderful rate, and were the wonder of every man who saw them growing."

From C. B. Ballard, of White River, Vt.: "I have grown eight acres of the Norway Oats this past season, and from a thorough experience I must say various new crops that have been introduced, I can truthfully say, these are far superior to them all, and I would not grow any other."

From Chas. W. Treadwell, Exeter, N. H.: "They have made an uncommon growth, considering the lateness of the planting. I have not yet thrashed them, but my neighbors are so much pleased with them, and the crop is so large, that the seed had been in a dry place all winter, and I was afraid to sow them as thickly as you directed, and *there missed it*. I have not taken extra labor for the purpose of getting a great yield, and I find I have from only one *twenty-five large, beautiful stalks*, well filled with oats. I have made something of an estimate of the yield and find the average about 600 from each oat, which I think is far ahead of anything ever known."

From A. H. Powers, Providence, R. I.: "It is but justice to you, as well as to the oats, to say that I did not have a fair chance, for I sowed green seed on the ground, which grew very fast and I had a crowd of hay after harvest. I did not think I could do better than that little piece of ground and from only a pint! Yes, sir, and I can show to anyone that can make the pains to call and see, that I have 100, and not one of the heads of any other kind, but real Norway Oats, just such as I have raised for, and I am satisfied. *Farmers, what more do you want?*"

From Wm. Clark, North Troy, Vt.: "In regard to these Norway Oats, I cannot say enough to their praise. They have gone far beyond my expectation. Although it was quite late when I sowed them, I think they are as forward as our common oats, that were sown some time before. I have not taken extra labor for the purpose of getting a great yield, and I find I have from only one *twenty-five large, beautiful stalks*, well filled with oats. I have made something of an estimate of the yield and find the average about 600 from each oat, which I think is far ahead of anything ever known."

From Joseph Griffin, Washington, Vt.: "When my Norway Oats got up about ten inches high, an ox broke into my field and ate them all down and pulled them almost all up. I did not think I could do better than that little piece of ground, and from only a pint! Yes, sir, and I can show to anyone that can make the pains to call and see, that I have 100, and not one of the heads of any other kind, but real Norway Oats, just such as I have raised for, and I am satisfied. *Farmers, what more do you want?*"

From Wm. C. Irish, Grand Isle, Vt.: "The growth of these Norway Oats I received from you is much larger than I have seen on any other seed. I sowed them at the rate of two hundred bushels to one bushel of seed. They are a new species to me, and are as early as the common oats. I think I can better hear them than I can hear you, for the reason that they are some ten or twelve pounds heavier to the bushel. In my opinion they are far superior to the common oat. I am much pleased with my crop of Norway Oats, and can truly recommend them to my brother farmers as the best I ever saw."

From Wm. C. Dutton, Saxton's River, Vt.: "On account of moving, I did not sow these Norway Oats until very late, and I did not think I could do better than that little piece of ground, and from only a pint! Yes, sir, and I can show to anyone that can make the pains to call and see, that I have 100, and not one of the heads of any other kind, but real Norway Oats, just such as I have raised for, and I am satisfied. *Farmers, what more do you want?*"

TESTIMONIAL.

We, the undersigned, having grown the Norway Oats furnished by Mr. D. W. Ramsdell, of Chelsea, and being fully satisfied of their great superiority over all other oats, both in quality and quantity of yield, most earnestly recommend their adoption by farmers everywhere, as a matter of personal profit to the farmer, as well as a national benefit.

Mr. Ramsdell's uniform and earnest perseverance, resulting in so important and valuable an improvement to the agricultural interest of the whole country, entitle him to our most hearty commendations.

We can assure our brother farmers everywhere that Mr. Ramsdell's enterprise is worthy of their encouragement and support.

Opinions of the Press.

The New York Independent says:—"We have reason to believe and welcome the Norway Oats as a new and valuable addition to the grain resources of the country."

Moore's Rural New-Yorker says:—"This new variety is attracting much attention, and those fortunate enough to obtain the seed will be greatly benefited by very large yields from it. We have received a package of heads, with stems attached, from Messrs. Jones & Clark, New York, and are much pleased with the appearance of the heads. The heads are very long, and the berry is large, dark in color, and very heavy."

The New England Farmer says:—"They are a wonderful grain, and no humping."

The New York Tribune says:—"They are being raised with success by many farmers."

Boston Traveller says:—"They are truly wonderful, and will not lodge."

The Farmer, Brattleboro', Vt., says:—"We know that many of the testimonials are from first class men."

CAUTION

The acknowledged superiority of the Norway Oats has attracted speculators to advertise that they have them for sale. All grain sold under the name of Norway Oats, but not under contract to furnish us with the product, those who advertise White Norway Oats have not the genuine seed. We will send an order, history of our grain, and the seed who will send for it, showing the frauds that are being practiced on the farming community.

CARD TO THE PUBLIC.

This is to certify that I have appointed Messrs. JONES & CLARK, of New York, my sole agents for the sale of the Norway Oats, for the purpose of securing the best prices for the same.

The necessity for a more central depot, as well as the extensive correspondence attending the business, my own affairs being detained by the contract of my farm, rendered this step necessary. Farmers desiring to procure the genuine Norway Oats, raised by me, should send their orders direct to them, as no other agents will be appointed.

Aug. 1st, 1888. D. W. RAMSDELL, Proprietor.

ORDER AT ONCE.

Farmers are reminded that although we have comparatively a large quantity of these oats for sale, it will not be possible for us to supply the demand unless we are compelled to return several thousand dollars, for want of seed, and were offered as high as fifty dollars for a single bushel. We have a large number of orders, and our seed is sold as early as June last, from parties who were determined to be in season this year. *It need not be said, if you wish to be sure, order at once. We will not be able to supply you long before spring. We shall fill all orders in the order of their receipt, on the plan of "first come first served."*

HOW TO OBTAIN THE NORWAY OATS.

Having accepted the agency of the Norway Oats, we shall furnish them on the following terms:

One quart, prepaid, by post.....	\$ 1.25
Two quarts.....	2.00
One peck, prepaid, freight for post on delivery.....	5.00
One half bushel.....	6.00
One bushel.....	10.00
Two and one-half bushel bags.....	19.00

When one bushel or more is ordered, they will be shipped by freight line when desired. Remittances should be in checks, drafts, post office orders, or if in money, by express or registered letters. In ordering, give your P. O. address, also state nearest express office, if to be sent by express. If required, we will send you a bill of lading, and we will not be held responsible for the money. As to our responsibility, we refer to the well known parties:

Messrs. HARRIS & BROTHERS, New York.
C. A. STEVENS & CO., New York.
WILKINSON HADLEY, Esq., Cooper Institute, New York.
Messrs. G. COLLIER & SONS, New York.

Write our address plainly on the envelope, and always put our box number on, as well as our place of business, as follows:

Collections containing a fine assortment of all the leading varieties of the above will be mailed post-paid, as follows: Collection No. 1, \$3.00; No. 2, \$10.00; No. 3, \$5.00; No. 4, \$3.00. For the contents of each collection and further particulars, see Catalogue.

Also a fine assortment of GREEN-HOUSE BULBS, comprising CYCLOMUS, IRIAS, OXALIS, SPARAXIS, TRITOMAS, ACHEMENSE, GLOXINIAS, &c., &c.

Particular attention is invited to their

New Illustrated Autumn Catalogue,
(containing an accurate description of each variety, with particular directions for culture, so that any person, however unacquainted, cannot fail to succeed, also a beautiful colored lithograph of the celebrated *Lilium Auratum*.) which will be mailed to all applicants enclosing ten cents. Orders may be addressed to B. K. BLISS & SON,
Box 622, P. O., New York.
Or, Drawer No. 11, Springfield, Mass.

LILUM AURATUM.

The Japanese Queen of Lilies.

We have a fine stock of this gorgeous Lily in splendid condition, many of which are of a larger size than any hitherto offered. A correspondent of the *London Times* has the following remarks regarding this, the most magnificent of modern floral introductions: "*Lilium Auratum*—This golden-rayed Queen of Lilies is the most beautiful of the Lily family. It is perfectly hardy; and for the adornment of the Flower-garden, the Conservatory, and the Sitting-room, is unrivalled. The whole English floral world, on its introduction, was jubilant with delight, hailing its advent as an astronomer would the discovery of a star of the first magnitude; and in every city, both in Europe and America, it has received ovations such as would have been dear to the heart of the most ambitious prima-donna or the most successful conquering hero."

Specimens were exhibited the past summer in England, 6 to 8 feet in height, with from 50 to 75 flowers. It is perfectly hardy—having stood out the past winter in Massachusetts, with a slight covering of straw. A beautiful two-paged lithograph, colored true to nature, will be found in our new Bulb Catalogue—which will be mailed to all applicants enclosing ten cents.

Flowering roots securely mailed to any address upon receipt of price.

Extra size, \$2.00 each. No. 1, \$1.50 each; \$12 per dozen. No. 2, \$1.00 each; \$9.00 per dozen.

A liberal discount to the

May Cherry (we think) the finest in the world. Concord vine, or get Catalogue free. **JOHN WAMPLER**, Trotwood, Ohio.

ONE-HALF THE AVERAGE SIZE.

EARLY ROSE POTATO.

Be Sure and Get the Genuine.

B. K. BLISS & SON,
Nos. 41 PARK ROW and 151
NASSAU ST., NEW YORK,
(OLD OFFICE OF AMERICAN
AGRICULTURIST.)

We offer for sale a fine stock of this valuable Potato, grown expressly for us from the original stock.

The experience of the past season fully confirms all that we stated in favor of this variety when we first offered it for sale last spring. Well-ripened tubers have been exhibited, grown in eight weeks, in the open ground, and we have abundant testimony from many growers to the fact that it has matured two to three weeks earlier than any other variety of superior quality, and enormously productive, yielding from 400 to 500 bushels to the acre.

A Silver Medal has been awarded us by the Massachusetts Horticultural Society, and special prizes at various other State and County Agricultural Societies, which, with the many favorable reports received from our Customers in various parts of the country, authorize us in recommending it as the earliest, most productive, and best flavored variety in cultivation. It is particularly recommended for culture in the Southern States, as new potatoes of this variety can be sent to the New York market as early as the more common varieties from Bermuda.

The following from a few of our correspondents will confirm what we have said.

Messrs. B. K. Bliss & Son—Gentlemen: I have this day tried on my own table, the Early Rose Potato. I find it to be of the first quality, and have no hesitation in pronouncing it one week or more earlier than the Goodrich Early, and quite as productive.
Yours as ever,
MARSHALL P. WILDER.

Messrs. B. K. Bliss & Son: The Early Rose Potatoes are dry, mealy, and of excellent flavor; in fact, the best early potato I have ever eaten, and I have tested most of the varieties for many years.
Yours Respectfully,
CHARLES DOWNING.

Messrs. B. K. Bliss & Son: I planted nearly a peck of Early Rose Potatoes this spring. They have fully answered my expectations, being large, fair, productive, early, and of good quality. I had no means of exact comparison with the Goodrich, but am satisfied that they are decidedly earlier.
Truly Yours,
JESSE VAND ZANDER.

Messrs. B. K. Bliss & Son: "I purchased of you last spring 2 pounds of Early Rose Potatoes. I gave a friend two potatoes, leaving me three; those I planted, from which I have this day dug two bushels and three quarts."
Yours truly,
E. L. WALLS, West St., Stephen's Church.

"Last spring I invested two dollars in one pound of Early Rose Potatoes—planted May 20th, and dug Aug. 23rd 14 1/2 lbs.—many of which weighed 3/4 of a pound, and the whole crop the largest potatoes I ever raised."
W. M. ALLEN, JR.,
MILFORD, Conn., July 4th, 1868.

"I have Early Rose Potatoes as large as goose eggs, while the Early Goodrich are only as large as buttons, both planted same date, April 15th."
W. M. ALLEN, JR.,
MT. PLEASANT, Del., August 18th, 1868.

"The Early Rose Potatoes I got from you are really early and fine. I planted May 4th, and took up July 10th 98 pounds of fine potatoes from one pound planting. They were perfectly ripe at that time, and might have been dug two weeks earlier for the table."
HENRY CLATCOCK.

We shall be prepared to execute orders from Oct. 1st to Dec. 1st, at the following prices:

One Pound, \$1.	Three Pounds, \$2, by mail, post-paid.
One Peck, \$5.	Half Bushel, \$8.
One Barrel, \$40.—60 lbs. to the barrel, 165 lbs. to the barrel.	One Bushel, \$15.

Cash to accompany the order. Price to the trade in larger quantities will be given upon application.

Caution.—In consequence of the great demand for this variety last spring, a spurious variety, which strongly resembled the Early Rose in appearance, but greatly its inferior in every respect, was widely disseminated, and will doubtless be offered again this fall. Beware of spurious varieties.

In consequence of the danger from frost in spring, all potatoes designed for early planting should be ordered in the fall. Potatoes will be delivered at the Express Offices, Bost., or Railroad Depots in New York City free of charge.

We also have on hand a large stock of *Early Goodrich*, *Sovereign*, *Dryden*, *Harrison*, and other leading varieties, at lowest market prices, a Descriptive Priced List of which will be mailed to all applicants.

Address, **B. K. BLISS & SON, Box 5,712, P. O., New York City.**

PATENT LEAD-ENCASED BLOCK TIN PIPE

IS
SAFE, STRONG, AND DURABLE.

It is recommended by the Medical faculty, endorsed by Water Boards, Agriculturalists, Engineers, and Experts; introduced into all the new PUBLIC SCHOOLS, HOSPITALS, DISPENSARIES, and most of the new first-class buildings. It gives perfect satisfaction wherever used, and, added to its sanitary advantages, it is cheaper and stronger than lead pipe.

All danger of lead poisoning prevented. This is the only pipe in the market which combines all the requisites of a perfect Water Pipe—Sanitary, Mechanical, and Economical. Water flows through it as pure as if drawn through silver. To furnish cost per foot, give us head or pressure of water, and bore of pipe.

Also, manufacturers of Sheet Tin, Solder, &c. Circulars sent free.

COWLETS, SHAW & WILLARD MFG CO.,
 Foot of West Twenty-seventh, N. E., New York. Down-
 town office, N. E., 100 Broadway, corner of Pearl.

FROM THE

"AMERICAN AGRICULTURIST."

NEW YORK, November, 1887.

"SAFE PIPE FOR DRINKING WATER.—Lead poisoning from water brought in lead pipe, is the often unthought cause of disease and death. Galvanized iron pipe, wood and cement pipe, are expensive and inconvenient alternatives, so that people will risk their health and use lead. The lead-encased Block-tin Pipe is even cheaper than lead, and we believe perfectly safe. Our faith in it has led us recently to lay some eighty feet of it, through which all our drinking water is drawn."

Speaking of the **NOVELTY CLOTHES WRINGER** exhibited at the late Fair of the American Institute, the **New York Liberal Christian** says:

"The Novelty Wringer received the marked approbation of the jury, and was awarded the **HIGHEST PREMIUM**. * * * It is now admitted that it has no equal as a family wringer. * * * It has the Patent Flange **Clothes Wheels** on both ends of the 15½ ft., as well as the most approved appliances for adjusting the pressure, so that a fine lace collar, or a heavy woolen blanket can be run through with equal facility and without injury. * * * Indeed, in all respects, its superiority is so apparent that the high testimonials it is constantly receiving can be readily accounted for. * * *

In fact, whenever and wherever exhibited it invariably secures the highest honors."

N. B. PHELPS & CO., Gen. Agts.,

No. 11 CORLEMAN ST., New York City.

Sold everywhere.

WILLARD AND EARLY ROSE.

Mr. C. W. Gleason, of Mass., one of the three gentlemen to whom the late Mr. Goodrich was accustomed to send his new seedling potatoes for testing, writes to him, recommending them to the public, and in honor of whom he named his Gleason potato, has for years previously been largely engaged in raising new seedling potatoes, than any man in New England. Last spring I purchased of him the entire stock of his "Willard" seedling (a seedling from the Early Golden Wonder), which he considers the best of all the hundreds of seedlings he has thus far raised. The "Willard" proves to be a remarkably productive and is a potato of great promise. I now offer to send one potato of this new seedling, gratis, with every pack of Early Rose; five with each bushel, and sixteen with each barrel.

My stock of Early Rose was procured directly from the original grower, and is WARRANTED TRUE. My rates this fall are:

One Pound, postage paid, \$1.00 One Peck, \$ 5.00

Three Pounds, " " 2.00 One Bushel, 15.00

One Barrel, " " 100.00

Each Bushel weighs 60 lbs.; each Barrel 165 lbs.

A discount on large quantities.

Early Goodrich per Barrel \$7.00 Harrison \$7.00

Early Schae \$5.00 Gleason \$5.00

NEW AND VALUABLE WORK.

A NEW BOOK.

BOOKS FOR FARMERS and OTHERS.

HOW CROPS GROW.

A TREATISE

ON THE

Chemical Composition, Structure,
and Life of the Plant,

FOR ALL STUDENTS OF AGRICULTURE.

WITH NUMEROUS ILLUSTRATIONS AND TABLES
OF ANALYSES,

BY

SAMUEL W. JOHNSON, M. A.

PROFESSOR OF ANALYTICAL AND AGRICULTURAL CHEMISTRY IN YALE COLLEGE; CHEMIST TO THE CONN. STATE AGRICULTURAL SOCIETY; MEMBER OF THE NATIONAL ACADEMY OF SCIENCES.

This is a volume of nearly 400 pages, in which Agricultural Plants, or "Crops," are considered from three distinct, yet closely related, stand-points, as indicated by the descriptive title.

The Chemical Composition of the Plant

Is discussed in three Chapters.

1st.—*The Volatile Part.*

2d.—*The Ash*—its Ingredients, their Distribution, Variation and Quantities. The Composition of the Ash of various Farm Crops, with full Tables; and the Functions of the Ash.

3d.—*Composition of the Plant in various Stages of Growth*, and the Relations subsisting among the Ingredients.

The Structure of the Plant and the
Offices of its Organs

Is the subject of the Second Division, in which are discussed

The Primary Elements of Organic Structure.

The Vegetative Organs—Root, Stem, and Leaf, and their Functions; and

The Reproductive Organs, viz., Flowers and Fruit, and the Vitality of Seeds with their Influence on the Plants they produce.

The Life of the Plant

Forms the Third Division, under which are discussed the Phenomena of

Germination, and the conditions most favorable and unfavorable to it.

The Food of the Plant when independent of the Seed. *Sap and its Motions*, etc., etc.

THE APPENDIX, which consists of 12 Tables exhibiting the Composition of a great number of Plants viewed from many different stand-points, will be found of inestimable value to practical agriculturists, students, and theorists.

SENT POST-PAID. PRICE \$1.50.

THE
TIM BUNKER PAPERS,

OR

YANKEE FARMING;

BY

ORANGE JUDD & CO.,

245 Broadway, New York.

ORANGE JUDD & CO.,

245 Broadway, New York.

KNOX FRUIT FARM AND NURSERIES.

Our Stock of **VINES and PLANTS** for Fall Sale is unsurpassed if equaled any where, and we guarantee prices to be as low as the same quality of a genuine article can be had any where. Stock offered at a low price than that for which it can be properly grown, is not likely to give satisfaction in any respect.

We call especial attention to our immense stock of

GRAPE VINES

one, two, and three years old, including every desirable variety. The

MARTHA (White Concord),

is now attracting much attention, and is regarded by competent judges, as much the most valuable White Grape now offered. The

Black Hawk

has given great satisfaction this season, and proves to be a very early and excellent variety.

With us no

STRAWBERRY

Has proved the past eight years of equal value with the

JUCUNDA—Our No. 700.

And the reports we are receiving of it from every part of the country are of the most favorable character. The **Fillmore**, **Triomphe de Gand**, **Burr's New Pine**, **Kittling's Goliath** and **Reed's Late Pine**, are among our most desirable kinds.

We can furnish the best varieties of

RASPBERRIES,

including **Hornet**, **Pilate**, **Philadelphia**, **Clarke**, **Kaoni**, **Dubbing**, **Kirtland**, **Im. Black Cap**, &c., &c. The **Kittling's Blackberry** has likely given more general satisfaction the past season, than any other. We offer plants of this variety this fall at greatly reduced prices. Also of **Wilson's Early** and **Rochelle**, &c. The **American Seedling Gooseberry** is reliable every where, and can be planted with the assurance of a crop of good fruit every year. One and two years' old plants for sale.

We have taken great pains to secure the largest and best collection of

CURRENTS

In the country, and now offer very superior plants of **Cherry**, **Versaillaise**, **Fertile d'Angers**, **White Grape**, **Victoria**, **La Native**, **Black Naples**, &c. This is one of the most different fruits to obtain true to name. Our stock may be relied on as genuine.

Our Small Fruit Catalogue of 64 pages, and **Fall Price List**, contain much valuable information, and will be sent to all applicants enclosing 10 cts.

We have been very successful sending Vines and Plants

BY MAIL,

and invite attention to liberal offers in Catalogue.

J. KNOX,

Box 155, Pittsburgh, Pa.

Riverside Nurseries, LEWISBURG, PA.

25,000 3 year old Apple, \$120 per 1,000; 100,000 2 year old Apple, consisting of the leading varieties, such as **King**, **Greening**, **Astrachan**, **Harvest**, **Pippin**, &c. 3 to 5 feet high, \$100 per 1,000; 100,000 1 year old Apple, leading varieties, 1 to 3 feet high, \$80 per 1,000; Apple Cions, \$200 per 1,000. 250,000 Yearling Cherry Trees, 3 to 6 feet high, on Mazzard stock, \$50 per 1,000; 250,000 Yearling Cherry Trees, 2 to 6 feet high, on Mahaleb stock, \$30 per 1,000. Orders for any of the above attended to with care and despatch.

A. F. S. SHILLER, Lewisburg, Union Co., Pa.

Peach Trees and Small Fruit Plants a Specialty.

Over 300 Acres of the above in fruiting. We are prepared to meet any requirements of the Trade. Dealers supplied on special terms. Catalogues mailed on special terms. N. BARNARD, Sull Pond P. O., Kent Co., Md.

LUMPS EVERBEARING RASPBERRY.—A good stock of this new and valuable variety at great reduction from former prices. Small fruits a specialty. Prices low. Send for Catalogue. Address H. B. LEM, Sandusky, Ohio.

FRUIT AND ORNAMENTAL TREES FOR FALL OF 1868.

We have the pleasure of announcing that we are prepared for the Fall Trade with an unusually large and well-grown stock, embracing

Standard and Dwarf Fruit Trees.

Grape Vines, new and old sorts, strong open groomed plants.

Currents, **Raspberries**, **Blackberries**, and all the Small Fruits.

Ornamental Trees and Shrubs.

Roses and Flowering Plants of every description.

Nurserymen, Dealers, and others, purchasing largely, will be dealt with liberally, and all orders, however small, will receive prompt and careful attention. Parties interested will do well to consult the following Catalogues, which are just issued, and will be sent pre-paid on the receipt of 10 cts. each, for Nos. 1 and 2, and 5 cts. for No. 3.

No. 1, Descriptive and Illustrated Catalogue of Fruits, No. 2, Descriptive and Illustrated Catalogue of Ornamental Trees, &c. No. 3, Descriptive Green-House Plants, No. 4, Wholesale Catalogue of Fruit.

EDWARD L. WANGER & BARRY,
MOUNT HOPE NURSERIES, ROCHESTER, N. Y.

Geneva Nursery. 300 acres in different stages of growth. FRUIT AND ORNAMENTAL TREES.

Standard and Dwarf Apple, Standard and Dwarf Pear, Standard and Dwarf Cherry, plenty of Early Richmond, Plum Trees, 2-year old, fine Trees, Apples, Nectarines, Blackberries, a fine stock of Missouri Mannish, Wilson's Early, Kittling's, and other Small Fruits. Send stamp for Trade List. W. & T. SMITH, Geneva, N. Y.

AUTUMN, 1868.

Rochester Commercial Nurseries,

ESTABLISHED, 1830.

W. S. LITTLE, Proprietor,

(Formerly H. E. HOOKER & CO.)

THE NEW CIRCULAR OF PRICES, (by the Dozen, Hundred, and Thousand), is just published, and will be sent FREE to ALL APPLICANTS.

Also, a new edition of the DESCRIPTIVE CATALOGUE—FRUIT AND ORNAMENTAL, 80 pages—containing much valuable information, mailed on receipt of 10 cts.

A SPLENDID STOCK is offered this year, of

Hardy Trees and Plants,

including

Standard and Dwarf Fruit Trees, of fine, thrifty growth.

Trees and Shrubs for Ornament.

ROSES—a beautiful assortment—on their own roots.

Grape Vines and Small Fruits of every description. Address early in the season.

W. S. LITTLE,
(Commercial Nurseries,) ROCHESTER, N. Y.

Early Goodrich.....	\$2.50	\$2.00	\$5.00
Gleason and Calcutt, each.....	1.00	2.00	5.00
Seedling No. 340, early, round, white.....	1.00	3.00	7.00
Harrison.....	1.00	3.00	7.00
Early Rose, 1 B. 81.....	3.00	5.00	10.00
Also, Shaker, Fancy & Early Seb., each 100.....	2.00	5.00	10.00

Have but few barrels of Early Seb., Utica, N. Y.

D. S. HEPFERN, Utica, N. Y.

Dutch Bulbous Roots,

Sent by Mail, post-paid, at Catalogue Prices.

Our large stock of **Hyaenitis**, **Tulips**, **Polyanthus**, **Narcissus**, **Jonquils**, **Crocus**, **Croton Imperialis**, **Iris**, **Snowdrops**, **Primulas**, **Anemones**, **Japan** and other **Lilies**, &c., &c., has been received in fine condition, and contains a splendid assortment of all the leading varieties named, post-paid, as follows: Collection No. 1, \$20; No. 2, \$10; No. 3, \$5; or, if desired, No. 4, at \$3. For contents of collections, information in reference to culture, &c., see our recent Catalogue, sent on receipt of 10 cts. which we will mail to all applicants enclosing 5 cts.

Address CURTIS & COBURN,

313 Washington St., Boston, Mass.

SHAKER GRAPE ROOTS.

Propagated at White Water Village, Ohio, from layers, and 2 best cuttings, started in Hot house and grown out of doors with much care. They are assuredly the best, and they will give satisfaction. They will be sold low. The varieties offered are **La France**, **Seedling**, **Concord**, **Hartford Prolific**, **Clinton**, **Delaware**, **Iona**, **Isabella**, **L Rogers**, **Hybrids**, Nos. 1 and 15, and **Martha**. Send for price list.

Address H. B. PEASE, Harrison, Ohio.

GRAPES.

We invite the attention of Dealers and Planters to our superior and perfectly healthy stock of **GRAPE VINES**, propagated from our own vineyards, and at low prices cannot fail to suit. Price Lists free to applicants.

C. L. HOAG & CO.,

Lockport Grape Nurseries, Lockport, N. Y.

Bloomington Nursery.

17th Year; 400 Acres; 10 Green-houses.

For the Fall Trade we offer much the largest and fullest assortment ever offered West.

Apple, **Pear**, **Cherry**—Standard and Dwarf.

Peach and **Plum**—Immense stock.

Grape Vines—Over 30 acres, 1 to 5 years, of nearly all the old and new kinds.

Small Fruits—Choice new, as **Kittling's** and **Wilson's** Early Blackberries, **Clarke**, **Thornless**, **Ellisville** Raspberries, **Jacunda** Strawberry, &c.

Evergreen and Forest Trees of all sizes—**Orange**, **Hedge Plants**—Apple and other **Fruit Tree Stocks**, **Yearling grafts or buds** of **Apple**, **Pear**, **Plum**, **Cherry**, &c.

Roses, largest and fullest assortment we know of—nearly all the new and best varieties.

Shrubs, **Creepers**, **Hardy Rubus**, for Fall planting. Send 3 stamps for 3 Catalogues, Wholesale, Descriptive, and Plant Catalogues.

Bloomington Nursery, McLean Co., Ill.

THE CLARKE RASPBERRY.

Send to headquarters for strong, genuine plants. The Clarke stands among Raspberries of all others as the Bartlett Pear does among pears. Enthusiastic Pomologists and Amateur acknowledge it by acclamation to combine more excellencies than any other Raspberry. It has paid \$1,000 per acre for fruit the past season. It is a true seedling of this County and is a specialty with me. My plants are propagated from a plant that has borne the original stock thirty years since, and are warranted genuine. Having disposed of the largest stock in existence the past season to Nurserymen and Dealers, and a few instances to private customers, purchasers will find it to their advantage to correspond with me, as I have the largest stock, which will be sold low.

GRAPE VINES.

A fine stock of Concord and Hartford Prolific grape vines, two years old root, pruned and transplanted, of extra large size, and will come into immediate bearing. To see them out I shall put them at the price of one year olds. Also a large stock of Rogers' Nos. 4 and 15, and other varieties.

LYMAN BASSETT, North Haven, Conn.

CAMELLIAS.

PARSONS & CO. offer a stock equal to any ever grown in the country. The attention of Plant-growers is invited to ours, which are very healthy and beautiful. They can be furnished from \$25 per 100 upwards, according to size and quality. For List and Prices address at

Flushing, N. Y.

T. C. MAXWELL & BROS., GENEVA, N. Y.

Offer to All Purchasers of Nursery Stock their Large and Complete Assortment of all the Leading Items of our Trade.

We invite

Nurserymen, Dealers, and Planters, to call and examine our stock, or write for particulars, with stamps for Catalogues as follows: No. 1, Descriptive Catalogue of Fruits. No. 2, Descriptive Catalogue of Ornamentals. No. 3, Descriptive Catalogue of New Plants, &c. No. 4, Wholesale Trade List.

T. C. MAXWELL & BROS., Geneva, N. Y.

APPLE STOCKS.—2,000,000 No. 1 Apple Stocks, the best one year-olds ever offered to the trade. Will be sold cheaper than the cheapest. Send for price circular.

C. F. LOVEACE, Iowa City, Iowa.

The Great Wilson's Early Blackberry.

Bears more, is larger and sweeter than any other. I have 100 acres planted with it; the plants for which, together with a large, fine stock for sale, were all propagated direct from the mother plant, which I have. Small lots sent by mail at annexed prices:

	doz.	100	1,000
Wilson's Early Blackberry.....	\$2.50	\$15.00	\$125
Kittling's ".....	1.00	6.00	50
Thornless Black Cap Raspberry.....	1.50	6.00	50
Joquette ".....	1.50	6.00	50
Clarke ".....	2.50	15.00	125
Philadelphia ".....	2.00	12.00	100
Brickell ".....	1.50	6.00	50
Prosser, New ".....	1.00	10.00	80

Asparagus Roots..... 1.00 10.00 80
All varieties warranted true to name. There is much lost by planting spurious sorts. For Strawberries, Currants, Grapes, &c., send for prices.

JOHN S. COLLINS, Moorestown, N. J.

FRUIT AND ORNAMENTAL TREES.

SMALL FRUITS, (including the new varieties), **RUBIARD**, **ASPARAGUS**, **HEDGE PLANTS**, &c., in large quantity, and of superior quality. Descriptive Price Catalogues mailed to applicants.

EDWARD J. EVANS & CO.,

Nurserymen and Seedsmen, York, Penn.

WAIT and get our prices before buying any **Grape Vines**, **Strawberries**, **Raspberries**, **Blackberries**, **Rubus**, **Antennaria**, &c. Antennaria stock, all of which we shall sell. Great inducements offered. Catalogues free.

C. E. & J. S. PHITTS, Elwood, N. J.

Grant vs. Seymour.

Wanted every man who expects to vote for Grant to send for CHAS. COLLINS' Small Fruit Catalogue, advertised on page 243.

Catalogues Sent Free.

We have a large importation of the choicest varieties of Dutch Bulbous Flower Roots, and are ready to fill all orders. Bulbs delivered free of charges. Address for catalogue, M. O'KEEFE, SON & CO., Rochester, N. Y.

THE PRESIDENT WILDER STRAWBERRY.

THE AMERICAN AGRICULTURIST SAYS:

"This is the result of years of experiment, and the one among thousands of seedlings considered by its originator as combining the most desirable qualities—a cross between La Constante and Hovey's seedling. We hope that Col. Wilder will accede to the wishes of his pomological friends, and allow this excellent and handsome fruit, which cost him so much labor to produce, to bear his distinguished name.

THE PRESIDENT WILDER, PRINCE OF STRAWBERRIES.

THE BEST STRAWBERRY EVER PRODUCED IN AMERICA.

Those who know Col. Wilder know that he would never allow his name to be associated with anything but THE BEST. So fully have we been impressed with his value, that we have bought of Col. Wilder, AT AN ENORMOUS PRICE, the entire stock of plants, all he has or will have, and now

OFFER AS A GIFT

To Every Subscriber for the AMERICAN JOURNAL OF HORTICULTURE,

whose name appears on our books for 1869, whether new or old.

TWO HEALTHY PLANTS OF THE PRESIDENT WILDER STRAWBERRY.

And it will be sent out in no other way. *This offer, of course, does not include those who have received other premiums or club deductions.* We shall deliver the plants in the order subscriptions are received; those coming first will receive the plants first. Subscriptions for 1869 may be sent in now. Price, \$3.00 per annum.

READ WHAT IS SAID OF THE PRESIDENT WILDER STRAWBERRY.

[Report of the Fruit Committee of the Massachusetts Horticultural Society.]
It is hardly, vigorous, highly productive; of largest size, superior in quality, beautiful in appearance, firm enough for market purposes, and should it sustain the character with other cultivars which its originator has obtained, it will prove to be the most valuable of the many contributions which Mr. Wilder has made to horticulture, and will worthily bear his name. With his permission, we are authorized, and do hereby, name his strawberry seedling, No. 13, "THE PRESIDENT WILDER."

Messrs. J. E. TILTON & Co.—*Gentlemen*: Some four years ago, my attention was called to some seedling strawberries, raised by Hon. M. P. Wilder, which appeared very well. I have watched them carefully since, both when on exhibition and at the nursery of the originator, and I do not hesitate to say that the No. 13, now known as "THE PRESIDENT WILDER," promises to be the most valuable strawberry in existence. It seems to possess all the good qualities desirable in this delicate fruit. We are very glad you have made arrangements to disseminate it in connection with your valuable Journal, and believe the public will appreciate the effort you are making to furnish them with a valuable strawberry and a valuable horticultural magazine.

Messrs. J. E. TILTON & Co.—*Dear Sirs*: My experience in purchasing and treating new varieties of strawberries, like that of most other amateurs, has been one of disappointment; and I have become very sceptical about new and highly praised seedlings. Still, repeated disappointments and failures do not prevent me from trying everything new that comes to my notice, and I have taken the trouble to make a thorough investigation of Mr. Wilder's new strawberry, and I am fully satisfied that it is all that is claimed for it, and that it is an immense acquisition. Yours truly, J. M. MERRICK, JR.

Messrs. J. E. TILTON & Co.—*Gentlemen*: I congratulate you upon the acquisition of the Prince of Strawberries, rightly named after one of our veteran Pomologists, President Wilder. Since the production of this strawberry, I have watched its growth from year to year with much care; from the first fruit to the close of the present season, I have considered it to be without exception the best strawberry in cultivation—possessing, as it does, all the qualities essential for a first-class fruit. DANIEL T. CHURCH, Fruit Carls & Co., 218 Washington-st., Boston.

J. E. TILTON & CO.,

Publishers of the American Journal of Horticulture, Boston, Mass.

Extraordinary Premiums to Persons getting up CLUBS.

Almost any one will find some of his friends and neighbors willing to join in a club, and by a little exertion can secure for himself these valuable premiums without cost. For \$3.10 will send 5 Lons, 5 Concord, 5 Hartford, 5 Ives' Seedling, and one of each Extra to Getter up, besides 1 Salem or 1 lb. Early Rose Potato as Extra Premium.—For \$10.10 will send 10 Lons, 10 Concord, 10 Hartford, 10 Ives' Seedling, and 5 of each kind Extra, and 3 Salem and 3 Kittatiny Blackberries to Getter up. All the above first-class plants from my well-known stock sent free of charge by receipt of Price. See my other advertisements. Send for Price Lists, Address, G. E. MEISSNER, Richmond P. O., Staten Island, N. Y.

THE EUMELAN is very vigorous, hardy, and productive, and ripens earlier than Hartford Prodic. The berries adhere firmly to the bunch, and do not drop from the vines or shrivel when suffered to hang a long time after being fully ripe. The flavor is *strongly pure* and *refreshing*, rich, sugary, suited, and vinous, ripening perfectly all through, and as soon at the center as circumference.

In short, the Eumelan possesses all of the high European qualities of excellence that are now indispensable to a valuable American Grape, without any of the native defects. The Lons for table and for White Wine are no superior in any country, and the Eumelan gives every indication of holding the same place for fruit, which, from its color, will give it great additional value. Like the Delaware, which is so deservedly popular, the Eumelan had triumphed over all the difficulties of negligent treatment during more than a quarter of a century in different localities before it became known to the public, and shows the most satisfactory record for disinterested persons.

The number of plants that I am now able to offer both of one and two years old, is small, but the quality is very high. Prices from three to 10 cents per plant, with full particulars of history, and description with representation of bunch, and prices with Club-propositions, sent two-cent stamp.

Iona, near Peckskill, Westchester Co., N. Y.

BULBS FOR FALL PLANTING.

HENRY FERRE,

(Old stand of B. K. Bliss.)

231 Main-st., Springfield, Mass.

Our *Autumn Catalogue*, containing a complete list of *Hyacinths, Tulips, Lilies, Narcissus, &c.*, is now ready, and will be forwarded to all applicants. Address, HENRY FERRE, 231 Main-st., Springfield, Mass.

COLFAX STRAWBERRY.

Send for our "LIST OF NEW SORTS," for description and beautiful cut of this berry, and remember we will give one *Hundred Dollars* to any person who has a sort that will prove to be more *productive*.

PURDY & HANCE, Palmyra, N. Y.

See our advertisement in Sept. No.

GRAPE VINES.

The subscribers are now prepared to furnish superior vines of 1 and 2 years' growth, in the leading varieties at moderate rates. Address, PETER DE PEW & SONS, New York.

Send for Price List, free. *Yonkers, N. Y.*
Letter from Peter De Pew, N. Y.—I wish to say of your vines that I have never seen better, and seldom as good. You are entirely right in propagating a small number of decidedly good ones instead of a large number of poor ones. The greater part of your stock will fairly come under the head of what are commonly called extras. PETER B. MEAD.

PEAK'S EMPEROR STRAWBERRY.

Our "List of New Sorts" gives full particulars with a most magnificent cut and truthful representation of this variety. See our advertisement in Sept. No. Address, PURDY & HANCE, Palmyra, N. Y.

or, PURDY & HANCE, South Bend, Ind.

Those wishing to purchase Strawberry, Raspberry or Blackberry Plants, Currant bushes, Grape Vines, or Early Rose Potatoes, at lowest rates, for good, genuine stock, please send for my new price Circular. Address, THOS. C. ANDREWS, Moorestown, N. J.

Apple and Pear Stocks, Osage Orange Plants, for fall 1868, all of extra quality, at wholesale and retail. Price reasonable. JOSIAH HALL, Tipton, Cedar Co., Iowa.

SMALL FRUITS—Strawberries, \$2.1000; Philadelphia Raspberry, \$20; Doolittle, \$12; Dorchester Black, \$15; Asparagus, \$3. SAMUEL T. DUFFELL, Tarryville, N. J.

Education of Animals.

WHAT WONDERFUL FEATS THEY HAVE PERFORMED—SIMPLE TRICKS EASILY TAUGHT—HOW TO LEARN THE SECRETS OF TRAINING, AND HOW TO MAKE A GOOD INVESTMENT.

Nearly all animals are capable of a certain amount of education; some more, some less. Our domestic animals learn to understand and obey certain commands; they also learn to do many things in a state of domestication which naturally they would not do. Under proper instruction they are often taught to do quite surprising feats, and a great deal of money is made by the exhibition of performing animals. The "trick" animals are the most attractive feature of circus exhibitions, and the owner of a single animal, well taught, will often acquire a

fortune from the hire of his animal's services.

Horses are the most common among educated animals, and they readily learn a great many amusing feats. Waltzing, feigning death, going lame with any foot desired, kissing, answering questions, finding hidden articles, "shaking hands," firing pistols, grinding organs, and other tricks, can be taught horses or ponies of ordinary intelligence.

Dogs are probably the greatest favorites with amateur trainers; they are less costly than horses, and can be taught perhaps even a larger number of feats. How proud the boy feels, whose dog will give him paw, beg, stand on his head, leap through hoops, carry baskets, bring articles he is told to go for, or do any of those things, which, with patience he may be taught! How popular such a dog is among that boy's school fellows, and what a hero his owner be-

comes! And a dog taught a few simple tricks will often sell for two or three times what he

would bring otherwise. But dogs have been taught much more wonderful performances; such as selecting the letters (on bits of card) of words given, to select a handkerchief of any color commanded from many of all colors, to place that handkerchief under any designated article of furniture; to give it to any designated person, or to a person dressed in any designated color; to select any article called for from many articles scattered promiscuously around; to bring any desired article from any designated place however distant; besides feats of muscular dexterity, like standing on a ball and rolling it up an inclined plane, &c.

Hogs are not generally considered very intellectual, but they have been taught to answer questions—by selecting the appropriate words

printed on cards; tell the day of week or month; tell the age of any lady present; and do other amusing things.

The sure-footedness of the mule enables him to do some feats which a horse would find rather difficult; walking on the tops of porter bottles is one of these. Bears, though so clumsy, are taught a variety of tricks; dancing, standing on their heads, playing the tambourine, and climbing posts, are the commonest. The reader will perhaps recall "Old Adam's" bears, who did much more; his collection including "dancing bears, crying bears, laughing bears, and singing bears;" though he probably had a vivid imagination.

The wonderful sagacity of the elephant enables him to comprehend what the trainer desires, with almost startling readiness, and he will with great docility go through a variety of performances, which doubtless seem very absurd to him. Even tigers are made to jump through hoops and otherwise display their agility. But

it would be tiresome to describe all the tricks taught monkeys, goats, cats, (who learn better than most persons would imagine, and perform some curious feats), and other animals. Even rats and mice may be trained.

Fleas have been also taught! A regular troupe has been exhibited, part of which were dressed up and taught to mimic human actors, while others personated horses and drew a little coach, with fleas for driver, footmen, and exalted personages inside, out riding for their health.

It is said that "whatever man has done, man can do;" so probably any intelligent animal can be taught any trick, however wonderful it may appear, if properly trained. There are many mysteries about training animals, and in the manner of arranging the tricks. In an early number of Haney's Journal will be given some curious details about Performing Animals, with

explanations of the tricks and instructions for teaching many animals. To those interested in

the subject the proposed information will prove highly acceptable, and will gratify that curiosity all persons have felt, on seeing exhibitions of performing animals, to know "how it is done." Many profitable and useful hints by which farmers and animal owners may profit, will doubtless be found, besides the instructions by which boys may tame and train their pets; and to all interested in the subject, we think the promised article alone will be worth more than the entire subscription price, whether they propose training animals for profit, or merely as a pleasant recreation.

Haney's Journal has presented many attractive features, given much useful and profitable articles, but the one in prospect will prove as popular as any heretofore given, and will doubtless add much to its already large circulation and wide popularity. The low price of Haney's

Journal places it within the reach of all—only fifty cents a year—and to all new subscribers for next year received this month, the Nov. and Dec. numbers of 1868 will be given free.

Haney's Journal will be enlarged with the January number, giving next year over 1,500 square inches of reading matter, illustrations, &c., every month. Quality, however, is more important than Quantity, and Haney's Journal is good as well as cheap. See advertisement at bottom of this page, wherein the publishers give further information.

HANEY'S JOURNAL FOR 1869.

Enlarged to double its present size—16 pages instead of 8—giving over 1,500 square inches of reading matter, illustrations, &c., every month. Some single retained, which has been so extremely popular, but with new attractions added. An intensely interesting exposure of

QUACKS.

—Quack Doctors, Quack Medicines, and Quack Books, besides tall, clear, and authentic exposures of all new humbugs and swindles, will be given by the author of the celebrated "Hogues and Hoqueries of New York." Also valuable recipes, useful arts, hints on health, wealth, success in life, social advancement, and all topics helping the young onward in the struggle of life, and, curious, amusing, instructive miscellaneous matter for all readers, with a moderate number of good engravings. We intend that HANEY'S JOURNAL shall PAY every subscriber. That it has done so in the past, we believe from the testimony of readers themselves.

To all new subscribers sending this month Fifty cents for subscription for 1869, we will send the Nov. and Dec. Nos. of this year free, if asked for.

1,500 square inches of good and profitable reading matter, attractive illustrations, &c., &c., in every number, all for

Only Fifty Cents a Year.

Send now. Fifty cents for a whole year. Single copies can be had of newsmen everywhere, and where convenient we prefer that the Journal be sent through some dealer in the neighborhood instead of subscribing. Any dealer will get it for you, if he does not keep it for sale. If you ask him to, specimens can be procured only from newsmen.

Dealers supplied by Wholesale Agents in all the principal cities. **JESSE HANEY & CO., Publishers, 119 Nassau-st., New York.**

CHOICE FRUIT TREES.

We offer a large stock of the following items, of an exceptional fine quality. We employ no Agents, but sell our best direct to Planters or Dealers at low prices. Write for full particulars.

DWARF AND STANDARD PEAR.
DWARF AND STANDARD CHERRY.
PLUM ON PLUM OR PEACH.

Farmers and Housekeepers TAKE NOTICE.

IN YOU WANT CHEAP SOAP, and at the same time, the very best of Soap, use

Saponifier, or Concentrated Lye, The Ready Family Soap-Maker.

The only genuine Lye in the market. A box of it will make much more soap than Potash or any bogus Lye.

MANUFACTURED BY

PENNA. SALT MANUFACTURING CO.
PITTSBURGH, PA.

Importers of **CRYOLITE**, and Manufacturers of the following
Standard Chemicals.

Natrona Bl Carb. Soda,	Natrona Saleratus,
" Sal Soda,	" Castile Soda,
" Potash Alum,	" Nitric Acid,
" Muriatic Acid,	" Redd. Saponifier,
" Redd. Petroleum,	" Sulphur,
" Chlor. of Calcium,	" Fluoride,
" Copperas, etc.	

(No. 2.)

\$7 to \$9 WILL BUY A CHALLENGE WASHING MACHINE, warranted the best in the world, regardless of price, and money refunded if it does not prove to be so. It washes easier, quicker and better than will less wear to the clothes, than any other machine or process.

30,000 Sold, and are giving the most perfect satisfaction. Agents wanted everywhere, for this and the CHALLENGE WRINGER and IRONER, a perfect Wringer combined with an Iron or Mangle. **WT. GOUT HEAT**, and very rapidly. Send for Circular, (enclosing stamp), containing 1,000 genuine references like the following:

Messrs. PALMER & Co., Gentlemen:—Your Washing Machine gives entire satisfaction to every one who uses it. We are only astonished that so much real value can be had for so little money. I am glad that poor as well as the rich can have such a splendid help for the duties of washing day.

J. K. Peck, *Presiding Elder, Honesdale Dist., Pa.*

Messrs. PALMER & Co.,—We have used the Challenge Washing Machine about eighteen months—have sold over sixty, and they are giving the most perfect satisfaction. For compactness, simplicity, durability, efficiency of work and ease with which they are handled and operated, they excel all Washing Machines I have ever seen.

L. W. Ely, *Member Erie (N. Y.) Conf.*

S. W. PALMER & Co., Auburn, N. Y.

HOME WASHER, Manufactured by the HOME MFG CO., is one of the greatest labor-saving machines ever invented. Warranted to wash two dozen collars and three shirts in five minutes. Other articles in proportion. These Washers are now manufactured by thousands, and sold in all parts of the world. But one expression is made in regard to them. (Thank God) they do the work better than the prilled directions. It is strong, durable, and with ease will last 20 years, and a beautiful piece of kitchen furniture. The price is so low no family can afford to do without. Price of Washer, \$15; Washer and Wringer, \$25. Delivered on board of boat or car, free of charge. Send remittances by Express, Post Office orders, or Bank Draft, to order HOME MANUFACTURING CO., 24 Courtland-st., New York.

HANCOCK'S CLOTHES DRIER.

Patented April 1868.

Is the most convenient thing yet invented for the purpose. It opens and closes like a fan, occupying when closed, only a few inches space on the wall. It has ten rays, any number of which may be opened or closed at pleasure. For drying of children's apparel it is especially adapted. It can be hung in high or low, opened or closed, taken down or put up in a moment, is cheap, substantial, and durable. *Is now on exhibition at Whitlock's Horticultural Hall, in the Agricultural building, and ought to be in every family.* Retail Price, \$2.00. Liberal terms to Dealers.

NEADE & CO., 148 Fulton-st., New York.

Housekeepers Try It.

"Russell's Patent Fruit Sizer" is the only machine which will sort grapes without disturbing the pulp or crushing the fruit. It is simple, elegant, durable, and effective. Retail price, \$1.50. Agents will be allotted a liberal discount.

DOW & WOOD, Manufacturers, Birmingham, Conn.

BLAIR'S PATENT RIGHT OR LEFT CORN HUSKER. The cheapest and best in market. For sale by all Hardware and Agricultural Dealers. Sample sent free to any P. O. in U. S., on receipt of 25 cents. Manufactured by E. BLAIR, Bucyrus, Ohio.

LAMB LIFTING MACHINE

The only Family Machine that sets up its own work. Knits all sizes, widens and narrows, knits the heel into the foot, and narrows off the toe complete—producing all varieties of knit goods.

It is simple, durable, easily operated, and warranted to succeed in the hands of every purchaser. Address with stamp for circular and sample stockings, JAS. D. O'NEAL, Gen'l Agent, 922 Chestnut-st., Philadelphia, Penn.

PAINTS for FARMERS and others.—The Grafton Mineral Paint Co. are now manufacturing the Best, Cheapest, and most Durable Paint in use: two coats will put on mixed with pure Linseed Oil, will last 10 or 15 years; it is of a light brown or beautiful chocolate color, and can be changed to green, lead, stone, drab, olive or cream, to suit the taste of the consumer. It is valuable for Houses, Barns, Fences, Carriage and Cart-makers, Pails and Wooden-ware, Agricultural Implements, Canal Boats, Vessels and Ships' Bottoms, Carvays, Metal and Shingle Roads, (it being Fire and Water-proof), Floor Oil Cloths, (one Manufacturer having used 5,000 lbs. the past year), and as a paint for any purpose is unsurpassed for body, durability, elasticity, and adhesiveness. Price 50 per lb. of 300 lbs., which will supply a farmer for years to come. Warranted in all cases as above. Send for a circular which gives full particulars. None genuine unless branded in a trade mark, Grafton Mineral Paint. Persons can order the Paint and remit the money on receipt of the goods. Address

DANIEL BIDWELL, 254 Pearl Street, New York.

ASK YOUR GROCER

FOR **TIERNAN'S LAUNDRY BLUE.**

TO FARMERS AND PLANTERS.

8,000 TONS OF DOUBLE-REFINED POUDRETTE
Made from night-soil, blood, bones, and offal, ground to a powder.

Its effects have been most astonishing, doubling the crops and maturing them ten days or two weeks earlier. Equal to the best brands of Superphosphate for *Present Crop* although sold only for Twenty-five Dollars per ton. Packed in bbls. of 50 lbs. each.

BONE DUST.

1—COARSE and FINE MIXED. 2—FINE, suitable for Drilling, and 3—FLOURED BONE.

WE WARRANT OUR BONE TO ANALYZE PURE. Packed in bbls. of 50 lbs. each. The oldest and best quality of Poudre and Fine Bone, mixed in equal proportions and drilled in with the seed, have produced most remarkable effects. Sold as an article of some purity and fineness in the market.

NITRO-PHOSPHATE OF LIME.

We offer this Phosphate confidently as being as good, if not superior, to any ever made or sold in this market, containing a larger amount of soluble Phosphate and Ammonia than usual in Superphosphates. For PERMANENT, as well as for immediate powerful effect upon land, IT HAS NO EQUAL.

EXCELSIOR!

A Long Step Forward and Upward.

ONE HUNDRED

different kinds of

Most Valuable

PREMIUMS,

Of most of which there is an unlimited supply, so that one or more can be easily obtained at every Post-Office in the United States and British America; yes, and in foreign lands. (Last year we sent premiums to the West Indies, to the Pacific Islands, to Australia, and elsewhere abroad.)

Every Article offered is warranted of the very best kind and true to the description. The terms and conditions are so liberal that almost any body desiring it can get one or more of the valuable articles. Don't fail to examine the whole list, make a choice of what you want most, and then you can get it free of charge.

This year, we propose to do something towards improving the Stock of our Country, and we add to our list valuable pure-blooded Breeding Animals, selected from the herds of some of the most reliable breeders of our country. These animals may be obtained by individuals, or for common use by the farmers of a neighborhood clubbing together. We offer

PURE BRED

**SHORT-HORN BULLS,
 AYRSHIRE BULLS,
 ALDERNEY BULLS,
 COTSWOLD RAMS,**

OF THE VALUE OF OVER \$4,000.

Also about \$2,000 worth of Pure-bred Poultry, in part directly imported from the best foreign stock. Among these are ten pairs each (except Brahmas) of

La Fleche—Houdans—Creve-cœur—Black Spanish—Light Brahmas—Dark Brahmas—Gold-laced Sebrights, etc.

Our Premium list this year contains nearly all the valuable articles offered last year, of which about \$20,000 worth were distributed among our readers, and were received with great satisfaction; and in addition to the above novelties we add the following: **Watches**, of A No. 1 quality, made expressly for our premium list by the American Watch Company; Early Rose Potatoes; Sets of Field Croquet, etc. Full details will be found in the following pages.

This is no Prize or Gift Enterprise.

We simply offer these articles as Premiums to those who send in the specified clubs of subscribers. See particulars.

EXPLANATION.—Our immense circulation enables us to do things on a grand scale, and doing thus, adds again to our circulation. We spend large sums for engravings, for collecting information, etc., and it costs no more for all these to supply half a million subscribers than it would half a thousand. There is but one office, one set of editors, engravers, etc., to be supported. Therefore we can furnish a superior paper at an exceedingly low price. We expend all the subscription money, and tens of thousands of dollars more, in simply getting up and furnishing the paper itself, and yet make a satisfactory profit, besides paying all the premiums. Our unprecedented circulation makes every line very valuable to advertisers, who gladly pay a large price to reach so many people—especially as they know we shut out humbugs and unreliable parties from our advertising columns. So our advertisements furnish money to pay premiums; the premiums get more subscribers; more subscribers add to the value of the advertisements, and thus we get more money for more premiums. The whole thing is simple, and only requires courage and enterprise to carry it out. Everybody gets a very good and very cheap paper; and thousands of people get good premium articles—just such as they want—simply by making up clubs of subscribers. Your opportunity to do this, Reader, is just as good as that of any other person in the world. What premium will you have? Further on we tell how to get it.

It Pays DOUBLY to try for our Premiums. A few odd hours' work, with a copy of the paper to show, will collect enough subscribers to secure one of the fine articles in our list. As a business, some Gentlemen, several boys, and many Ladies, canvassed for subscribers, received various premiums, sold them for cash, and made high wages. One Lady thus made \$1,200 in less than 6 months the past year. Others made \$150 to \$250 each, in single months.—Again, Everybody that circulates the *Agriculturist*, and thus gets more people to reading and thinking, is doing a good work for the country. Twenty-five copies circulating in a neighborhood will stimulate thought and enterprise that will soon increase the value of all the property in the place.

Presents.—Many persons make up clubs and secure our premium articles, as sewing machines, silver sets, etc., for presents to a wife or friend. Many neighborhoods make up clubs for sewing machines to be given to poor widows, or to a Pastor's wife. Scholars unite and get a Watch for a teacher, a Melodeon for their school room, and so on.

[In the following table is given the price of each article, the number of subscribers required to get it free, at \$1.50 a year, and at the lowest club rate of \$1 a year. Full descriptions of the articles are given in the pages following.]

Table of Premiums and Terms, For Volume 28—(1869).

Open to all—No Competition.

100	A Choice of Good Books (See Terms below),	\$100 00	125	350

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

Read and carefully note the following items: (1) Get subscribers anywhere; all sent by one person count together, though from one or a dozen different Post-Offices. But... (2) State with each name or list of names sent, that it is for a premium list, and we will so record it... (3) Send the names as fast as obtained, so that the subscribers may begin to receive the paper at once. You can have any time, from one to six months,

to fill up your list as large as you may desire. The premium will be paid whenever you call for it.... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts.... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers. N. B.—The extra copy to clubs of ten or twenty is not given where premium articles are called for.... (f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the prepaid postage, about 10 cents.... (g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of them is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster and take his receipt for it. Money sent in any of the above ways is at our risk.

READ THE

Description of the Premiums.

Nos. 1 to 28.—Breeding Animals.
General Note.—While there is an ample supply of nearly all other premium articles, the supply of animals is necessarily limited to the specimens named below, and our rule will be to furnish each one to the first party calling for it, with the specified number of subscribers.

Nos. 1, 2. — Short-Horn Bulls.—These two splendid animals are from the most celebrated herd in America, that of Mr. JAS. O. SHELDON, Geneva, N. Y., which is abundant guarantee of their quality and value. The Short-horns, or Durhams, are distinguished for their very large size, rapid growth and maturity, and easy fattening. They are the best beef cattle in the world for profit of raising. This breed has received more care and study than all others taken together. One of these bulls introduced any where will tell greatly upon the future character of all the stock brought under its influence.

No. 1.—Champion.—Red, calved May 21st, 1868. *Sire*, Royal Duke of Oxford, 4574 E. B. *Dam*, Chancery, by Lord Mayor of Oxford, 254, whose lineage is traced through the bulls Duke of Gloster, Lord Brawley, Prince Ernest, Charles, Miracle, Scotch, Fitz Remus, to Duke (119) and White Bull (165), many of them famous sires of superior stock.—Price \$500.

No. 2.—Malcolm.—Rich roan: calved May 1st, 1863. *Sire*, Baron of Oxford, (2376 E. B.) *Dam*, Minnie, by 2nd Duke of Thorne (1748), her pedigree running back to those old worthies Nell Gwynn, and Princess by Favorite, and to the famous bulls Hubback, Snowdon's, Masterman's, and the Studley bull in all 19 recorded Herd Book crosses.—Price \$500.

Nos. 3 to 11.—Ayrshire Bulls.—Ayrshires are especially distinguished for the milking qualities of the cows, which uniformly yield milk in large quantity and usually rich. The steers and dry cows make excellent beef. Their size is medium, and colors usually red and brown, spotted with white. The animals offered are selected from two of the best herds in the country. That of Mr. WM. BUNNIE, of Springfield, Mass., is one of the oldest and most celebrated, while that of the Messrs. S. M. & D. WELLS, of Wethersfield, Ct., has a more recent fame. The cows of the latter herd probably give a larger quantity of milk, the year through, than any other equal number of cows in the country. All Ayrshires give a large quantity of milk compared with the amount of feed. The bull Aleck Christie, sire of all the animals offered from the Messrs. WELLS' herd, is out of Dolly 3d, whose yield of milk the present year averages as follows: March, 48 lbs. per day; April, 69½ lbs.; May, 54½ lbs.; July, 49½ lbs.; Aug. 46. The milk of Aug. 9th, 10th, 11th, and morning of 12th, 3¼ days, made 7 lbs. of butter. Greatest yield of milk in one day, 57 lbs.

BRED BY MESSRS. S. M. & D. WELLS.

No. 3.—Werner. brown and white, calved April 8, 1868. *Sire*, Aleck Christie, out of Dolly 3d, by John Anderson. *Dam*, imported Queen 2d, winner of four first prizes in Scotland.—Price \$300.

No. 4.—Bull Calfr, Duke of Hartford. red with little white, calved June 2d, 1863. *Sire*, Aleck Christie. *Dam*, Flora 3d, winner of first prize of N. E. A. S. L. Soc. at New Haven, 1868. *Grand-dam*, Flora 2d, winner of 1st Prize of N. E. A. S. L. Soc. in 1867; *Great Grand-dam*, imported Florida, winner of 1st Prem. and Sweetest of N. E. A. S. L. Soc. in 1866. Price, \$300.

No. 5.—Bull Calfr, McKeown. red and white, calved Aug. 1st, 1868. *Sire*, Aleck Christie. *Dam*, imported Minnie. Price, \$200.

No. 6.—Bull Calfr, Malvern. red and white, calved April 28, 1868. *Sire*, Aleck Christie. *Dam*, Daisy 8. Price, \$200.

BRED BY MR. BIRNIE.

No. 7.—Dugal Grant. dark brown and white, dark about the head, calved Feb. 1, 1868. *Sire*, Malcolm, 254. *Dam*, imported Miss Morton, 1863. Price, \$150.

No. 8.—Johnny Groat. red, and white in large spots, calved Feb. 1st, 1866. *Sire*, Honest John, 139. *Dam*, Sen, 750. Price, \$150.

No. 9.—John Brown. red and white, calved Aug. 30th, 1867. *Sire*, Honest John, 139. *Dam*, Peggie, 601. Price, \$150.

No. 10.—Bull Calfr. red and white, calved September 6, 1868. *Sire*, Honest John, No. 139 in Ayrshire Herd Book; *Dam*, Peggie, 601. Price, \$80.

No. 11.—Bull Calfr. red and white, calved Aug. 18th, 1868. *Sire*, Honest John, 139. *Dam*, Dolly Dutton, 345. Price, \$80.

Nos. 12 to 15.—Alderney Bulls.—This valuable breed is distinguished for richness of milk, and golden yellow, waxy, high-flavored butter. The cows are almost always good, and occasionally deep milkers; size below medium; colors various; skin rich orange yellow. Steers and dry cows fatten easily. Those offered are premiums selected from the herd of Mr. JAMES P. SWAIN, of Bronxville, N. Y., one of the oldest Alderney breeders in the United States, who has spared no pains to improve his stock in every way. These are bred with the highest fancy marks—no white spots; noses, mouths and tongues black.

No. 12.—Wachusett.—French gray and black; calved March, 1867; *Sire*, imported Bashan; *Dam*, Hecy, by imported Saturn, out of imported Lophern. Price, \$250.

No. 13.—Acuteity.—Brown, with squirrel ears; hairs; legs fawn color; calved March 17, 1868; *Sire*, imported Bashan; *Dam*, Bronx 2d, by imported Saturn, out of imported Lophern. Price, \$200.

No. 14.—Ossipee.—Dark brown, with squirrel haires; legs dark fawn; calved March 14, 1868; *Sire*, imported Bashan; *Dam*, Islip, by Matfield bull, out of Bird cow. (Imported.) Price, \$200.

No. 15.—Allegany.—Blackish-brown, with squirrel hairs; legs dark fawn; calved March, 1868; *Sire*, imported Bashan; *Dam*, Katy 3d, by Derby; he by imported Saturn, out of Lophern. Price, \$200.

No. 16 to 21.—Cotswold Sheep.—Long-wools.—One of the largest mutton breeds. Rams frequently weigh 40 pounds or more. This breed is famous for early maturity, large size, and ease of fattening. The quality of the mutton is good; the wool is very long and silky, and "common long combing" is now bringing the highest price of any wool in the market. The flock of Mr. BENNETT Loomis, of Windsor Locks, Ct., from which our premiums are selected, has swept all the chief prizes for long wool sheep, at the New England Agricultural Society fairs, from 1865 to the present year. Mr. L. has made repeated imports from the best English flocks. The sire of all but one of the sheep offered is Emperor 2d, bred by Robert Garne, North Leach, England, and purchased at his sale when a yearling for 130 guineas!

No. 16.—Cotswold Ram (No. 43.) Got by imported Emperor 2d, out of imported ewe bred by Robert Garne, Esq. Price \$300.

No. 17.—Cotswold Ram (No. 48.) Got by imported Emperor 2d, out of imported ewe, imported from flock of Robert Garne, Esq. Price \$300.

No. 18.—Cotswold Ram (No. 2.) By imported Senator, out of ewe by ram bred by F. W. Stone, Canada. (Senator was bred by Robert Garne, Esq., and won the prize for best ram of any age at the New England Society in 1863. Also first prize as a two-year old.) Price, \$100.

No. 19.—Cotswold Ram (No. 30.) Got by imported Emperor 2d, out of ewe bred from imported stock. Price \$100.

No. 20.—Cotswold Ewe. By imported Emperor 2d, out of ewe bred from imported stock. Price \$100.

No. 21.—Cotswold Ewe. By imported Emperor 2d, out of ewe bred from imported stock. Price \$100.

Nos. 22 to 28.—Choice Fowls.—The 130 fowls offered as premiums are from the flocks of Mr. JNO. H. MABRETT, of Tarrytown, N. Y., one of the most successful and careful breeders of our acquaintance. A rare opportunity is here offered for obtaining very superior fowls of some of the most highly prized breeds.

... La Fleche, Houdan, Crevecoeur, (French Fowls) large, easy fattening, excellent for the table, and persistent layers—great favorites, are all imported or bred direct from imported stock.... Black Spanish, (fall white feathers) stand first as constant layers, very ornamental and stylish, require warm winter quarters.... Brahma, large fowls, hardy, winter hivers, chickens very early, and easy to raise.... Shriest Babtons, very small, with beautifully marked plumage; cocks and hens feathered alike; purely ornamental; hardy and easily raised. The last three kinds are from his own justly celebrated stock. We have only ten pairs of each.

No. 22.—La Fleche Cock and Hen. Price \$40.

No. 23.—Houdan do. do. Price \$40.

No. 24.—Crevecoeur do. do. Price \$40.

No. 25.—Black Spanish do. do. Price \$25.

No. 26.—Brahma Light do. do. Price \$15.

No. 27.—Brahma Dark do. do. Price \$15.

No. 28.—Gold Laced Shriest do. do. Price \$15.

No. 29.—Early Rose Potatoes.—This remarkable variety has awakened so much interest throughout the country that there is a general desire to get a few as a start for seed. A few hundred people only have been able to get them. We have, therefore, arranged with Messrs. B. K. Bliss & Son to supply us with a quantity of the genuine article, put up in 3 lb. parcels, to go by mail, post-paid, to any part of the country. Late in this we will keep them until warm enough to mail them in Spring. This premium can only remain open so long as the supply lasts. For some account of

the Early Rose, see page 336 of the *Agriculturist* for this month (October), and Messrs. Bliss & Son's advertisement in same paper. We send to clubs of four at \$1.50 each, which will give the canvasser 3 lbs. For fourteen subscribers at \$1.50 each, we will send four 3 lb. packages.

No. 30.—Garden Seeds.—A valuable selection of 40 varieties of the best seeds for a family garden, each parcel large enough for a garden of ordinary size. This premium and the next are put up for us by Messrs. B. K. Bliss & Son, Seed and Horticultural Warehouse, 41 Park Row (old Agricultural office) whose seed establishment is well known as one of the best in the country. This premium will be of great value and convenience to many, as we send the seeds post-paid to any part of the United States. In many cases the recipient will have some to spare to members of the club.

No. 31.—Flower Seeds.—Like No. 30, this is a valuable premium. It consists of 100 different kinds of beautiful flower seeds, all in separate papers, and includes not only the finer common varieties, but many of the newer and rarer kinds that are costly when bought by the single paper. *Delivered free*, same as No. 30.

No. 32.—Nursery Stock, Plants, etc.—This premium can be selected in anything desired, from the Catalogues of Parsons & Co., Flushing, N. Y., or of F. K. Phoenix, Bloomington, Ill. Both are well known, very reliable parties, having extensive Nurseries, Green-Houses, Ornamental Trees and Plants, Grape Vines, Shrubs, etc., etc. Send a stamp direct to either of them, for their regular catalogues; if about this premium, they will go free. For this premium any one can select from the catalogues \$20 worth, (or more in proportion, if more names are sent us,) and we will send to the canvasser an Order for the amount on either party named above, in fall or spring, as desired.

No. 33.—Set of Field Croquet.—The game of Croquet is so pleasing, and has become so popular, that we believe many will be glad to avail themselves of the opportunity of obtaining this new Premium upon terms as easy as we propose. The sets we offer are beautiful, and from one of the best makers in the country. The balls are rock maple, and every set is newly finished and put up in a thoroughly made box, with separate places for balls and bridges. A very little labor will secure this fine Premium, valuable to both sexes.

No. 34 to No. 40.—Sewing Machines.—We offer a choice of the leading good Sewing Machines, and recommend any one of them as of great value. Each of these seven machines has some peculiarities in which it is superior to the others. We have used them all at home during the last seven years, except the Tailoring Machine, and that we have watched carefully in the hands of others. We could not part with the last one of them, which we might be tempted to do with any Sewing Machine, for \$500! The \$500 at 7 per cent. interest, would yield, less taxes, about \$32. Most families require at least 4 months of steady hand-sewing a year, costing, if all hired, not less than \$24 a month, board included, or \$96 a year. With a Sewing Machine a woman can sew more in one month than in four months by hand. Here is a clear saving of \$72. But far above this. The everlasting "Stitch, stitch, stitch," headed over the work, and loss of sleep, have brought tens of thousands to early graves, broken down millions more at an early age, and entailed crippled constitutions upon many millions of infants. We say to every man, get your wife a Sewing Machine, even if you have to sell a favorite horse or an acre or two of land. A Sewing Machine costing \$55 to \$55 involves an interest of only 83 or 84 a year; it will, in the long run, save you five, if not a hundred, fold, in Doctor's bills alone. Get the Sewing Machine any way. If you can get one through our premium list, well, but get the machine. Every machine is boxed and delivered free to railroad or express, or other place in this city, and costs the recipient only the freight. They go safely as freight. Full printed instructions go with each, and each machine is supplied with a Hemmer. Send for circulars to:

Wheeler & Wilson Mfg Co., 625 Broadway, N. Y. City.
Grover & Baker Mfg Co., 405 Broadway, N. Y. City.
Horn & Mowbray, 169 Broadway, N. Y. City.
Fluence Sewing Machine Co., 505 Broadway, N. Y. City.
Singer Manufacturing Co., 458 Broadway, N. Y. City.
Willcox & Gibbs Mfg Co., 408 Broadway, N. Y. City.
Finkle & Lyon Company, 587 Broadway, N. Y. City.

No. 41.—Washing Machines.—For a long time we have annually tried many new Washing Machines, and "Dolly's Paragon," which we have now used nearly four years, is the only one the "club" will use voluntarily. Send for full Descriptive Circulars to R. C. Browning, 32 Courtland-st., N. Y., or to Metropolitan Washing Machine Co., Middlefield, Ct. It packs in small compass, and goes cheaply by freight or express.

No. 42.—Clothes-Wringing Machine.—A very useful, time-saving, strength-saving, clothes-

saving implement, that should be in every family. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibres with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the garments. A child of 10 or 12 years can quickly wring out a tub-full of clothes. We offer the family size, "A Universal Wringing," with *Cogs* which make the rollers turn together, and prevent injury to the fabrics, loosening the rubber, etc. It weighs only 15 lbs., and can be readily carried by hand, or sent by express, or by freight, anywhere. We have thousands of these as premiums, with almost universal satisfaction. Thousands of families may each get a premium one this year. They are made by the Metropolitan Washing Machine Co., Middlefield, Ct.

No. 43—A Tea Set.—This premium has given the greatest satisfaction for the last three years. There are six pieces, viz: *A Coffee Pot, two Tea Pots, a Creamer, Sugar, and Stop Board*—all of beautiful, uniform pattern, new style, with raised and embossed figure work. They are not the common silver-washed articles, but the heaviest plate, equal to "Sheffield Plate," the foundation being white metal, so as not to show, even when the heavy silver-coating may chance to be worn off in any spot by long hard usage.—These Sets are made by the Lucius Hart Manufacturing Co., of Nos. 4 and 6 Central Slip, N. Y. City. Mr. Hart, "the veteran Sunday School man," has been in the same place and business for nearly a quarter of a century. We have known him and his work for many years, and take pleasure in commending and guaranteeing its value to be as represented. The amount of silver on plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly as good looking plated ware for less than half the money. The Sets given as premiums are boxed without charge, and sent to any place by express or otherwise as desired.

No. 44—Caster and Fruit or Cake Basket Combined.—This is a new pattern, both novel and beautiful. It can be used as a large, showy, Caster, with six cut glass bottles, or be instantly changed into a complete Caster, with Call Bell, and a separate Cake or Fruit Basket, with a colored glass dish inside. Every one receiving it will be delighted. It is from the same makers as No. 43, of the same metal, plating, etc., and is sent in the same way. Many lower-priced and less beautiful Casters could be obtained, but we select the best.

No. 45—Ice or Water Pitcher.—A large and ornamental article. It is of the same metal, plating, etc., and by the same makers as No. 43. For 23 subscribers at \$1.50 each, we will add a round Silver of large to correspond (value \$1.50). Also, a silver-plated, large 10-inch oval Salver, (value \$14), large enough for two goblets with the Pitcher; and for 33 subscribers, the Pitcher, large Salver, and a pair of beautiful Goblets, silver-plated without, and gilded within (value \$38). This complete Set is exceedingly desirable, though the Pitcher alone, or that and the smaller Tray or Salver, will answer a good purpose, both for use and ornament.

No. 46—One Dozen Teaspoons.—These are of fine pattern, "figured tips," Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 43. They are far cheaper than any thing we have found at half the price.

No. 47—One Dozen Table Spoons.

No. 48—One Dozen Table Forks.—The same description, and the same makers apply to these as to No. 46. We select as premiums only the best articles, and can warrant every way in quality and price. All these articles come from the Lucius Hart Manufacturing Co.

No. 49, 50, 51.—Knives and Forks.

—The knives offered in this premium are from the most celebrated makers of cutlery in the world, Joseph Rodgers & Sons, Sheffield, England, whose corporate marks is dated 1761. They are of the best refined steel, with ivory balanced handles, and stamped with full address of makers; size known as table knives.—The table forks are manufactured by Holmes, Douth & Haydon, on genuine albat, and warranted double plated with coin silver. The tea knives and forks are by the same makers, but of smaller size. The carving and dinner fork are both steel, made by Rodgers & Sons, best ivory balanced handles. For 33 subscribers, at \$1.50 each, we will send the tea knives, of the same make and material, double silver plated, forks the same, (value \$25). For 45 subscribers, at \$1.50 each, we will send the table knives, double silver plated, with same forks, (value \$30). These articles are furnished to us by Messrs. Patterson & Brothers, 27 Park Row, agents for the manufacturers, and a thoroughly established and reliable house, who will furnish the above articles at prices named, and express charges paid in advance who may wish to purchase. (Send for their circulars.)

Nos. 52, 53—Melodeons.—These are excellent and desirable instruments, for the Home Circle, for small Churches, for Sunday Schools, for Day Schools, Academies, etc. Instrumental and Vocal music in a school has a beneficial influence upon the pupils. We have seen the whole tone and character of the pupils of a school improved by introducing a Melodeon.—Set the pupils to work and they will raise a club of subscribers for this premium. We offer Geo. A. Prince & Co.'s Melodeons, for we know them to be good. A large one in our own Sunday School room has been in use for nine years, and is to-day just as good as when first purchased, though used from time to time by large number of persons.—Several clergymen have obtained this premium for themselves, their Churches, or Sunday School rooms. The premium clubs of subscribers were quickly raised among the members of their parishes.—Many others can get this premium for their own home use. We have given these instruments as premiums for several years, and we believe they have invariably been highly esteemed. Send a postage stamp to Geo. A. Prince & Co., Buffalo, N. Y., and get their illustrated descriptive circular giving full particulars of Prices, sizes, and prices. The premium Melodeons will be shipped direct from the manufactory at Buffalo, ready boxed for safe transportation by Railroad, Steamboat, or by Express, as ordered. They go just as safely by freight, as by express.

No. 54—Steinway Piano.—SEVEN OCTAVE, ROSEWOOD CASE; SOLID ROSEWOOD DESK, LARGE FRONT, ROUND CORNERS; OVERSTURD BASE, FULL IRON FRAME, PATENT AGRAFFE TABLE, GOTHIC LEGS, AND CARVED LYRE.—This is one of the most elegant Premiums ever offered; regular and only price \$650. That this magnificent instrument comes from the celebrated establishment of MESSRS. STEINWAY & SONS, Nos. 71 and 73 East 14th street, is enough to say; but it is due to these enterprising manufacturers to state that, while their pianos have repeatedly received the FIRST PRIZES at the award of the most competent judges the world can produce, at the Universal Exposition, in Paris, they received the FIRST GRAND GOLD MEDAL for American Pianos in all three styles exhibited, viz: Grand, Square, and Upright. The following official certificate was signed by the President and the five members of the International Jury: "Paris, July 20th, 1887. I certify that the First Gold Medal for American Pianos has been unanimously awarded to Messrs. Steinway by the Jury of the International Exhibition. First on the List in Class X." The Society of Fine Arts, in Paris, unanimously awarded Steinway & Sons their only annual Testimonial Medal for 1887. The President of the Musical Department of that society reports: "The Pianos of Messrs. Steinway appear to me, as well as to all the artists who have tried them, superior to all that have been made to this day in the entire world." The best judges in America say the same. We also specify that, while at home, and desires no better. This splendid premium may be secured by many persons. Only 540 subscribers are required to do it. One lady obtained two and sold them, and several others one each, during last year, in 1 to 3 months. It will pay for every year's labor. Classes of young ladies at school might unite in canvassing, and obtain a present for a Teacher, or a Piano for their schoolroom. We shall be glad to give this premium to a large number. Who will try for it? Write to Messrs. Steinway & Sons for a free circular describing it.

No. 55—Collibri Piano.—This is a newly invented Piano, the work of Mr. Frederick Mathueke, who has for many years been known among manufacturers as the author of some of the best improvements introduced into the piano. It is only 4½ feet long, 24 feet wide, of the square form, yet having 7 full octaves. Some eminent musicians examined it at our request, and pronounced it an instrument of remarkable power, brilliancy, and sweetness. H. Mollenhauer, Director of the Conservatory of Music, New York, says: "Their tone is truly astonishingly sweet, pure, and powerful, and so greatly superior to all others, that they must be heard to form a just conception of their superior excellence." Its peculiar construction secures improved tone, sounding qualities, stability, and beauty. It is finished in handsome style, with rosewood case, large round corners, fancy scroll desk, legs, lyre, etc., and will be an ornament in any parlor, besides being entirely satisfactory as a musical instrument. Other styles are made by the same firm, in this was selected as especially adapted to the wants of many of our readers. Messrs. Barlow, Doehler & Co., 694 Broadway, N. Y., are the agents, and will send circulars, giving full particulars.

No. 56—A Good Watch.—The American Watch Co., of Waltham, Mass., is now so well and so favorably known that the statement that a watch is of their manufacture will be regarded as a sufficient guarantee of its value. We have arranged with that Company to make for us a Silver Watch, jewelled, with chronometer balance, warranted by them in the style of the best materials in the best manner, and in pure coin silver "hunting" case, weight 3 oz. This watch we offer as one of our Premiums, with the fullest confidence that every one who secures it will obtain a valuable Time Piece, in every way reliable. Upon the movement of each of these watches will be engraved, "American Agriculturist. Made by the American Watch Co."

No. 57—Ladies' Fine Gold Watch.—This elegant Premium will delight our friends who may receive it. Our arrangement with the American Watch Co. (see No. 56 above) includes the manufacture of these beautiful gold watches. They are all jewelled, in 18 carat "hunting" or closed cases, warranted by that Company to be made of the best materials, and possessing every requisite for a reliable Time Keeper. As in the case of the Silver Watches, upon the movement of each Premium watch will be engraved "Am. Agriculturist. Made by the Am. Watch Co." Here is a beautiful gift for a friend, which is within the reach of many.

No. 58—Double Barrel Gun: or FOWLING PIECE.—These guns are the genuine London "Twist" barrel, Patent Breach, Bar Lock, open ramrod, and all respects described. The calibre of the manufacture of barrel vary, and may be ordered to suit the kind of shooting to be done. As a special favor they are furnished for this premium, by Messrs. Cooper, Harris & Hodgkins, 177 Broadway, well known as one of the most reliable and best houses in their line of business, and they highly recommend this particular gun, and guarantee it in every respect. It is from one of the oldest and most favorably known English manufacturers. Mr. Cooper assures us that it is just the gun he should take if he were going out for a day's shooting. The price is not put on in fancy carving, and plating for show, but in the gun itself. We could get more fancy looking guns for half the sum, but we offer only real, reliable articles, those cheap at the prices named. This premium includes Gun, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 59—Roper Repeating Shot Gun.—Bang, Bang, Bang, Bang—four times in 4 seconds! This gun just meets the wants of sportsmen. It is a splendid shooter, is fired four times without re-loading, the cost of ammunition is no more than for a muzzle loader, it is very light, (6½ lbs.) and the charges are waterproof. The barrel is steel, 25 inches long, with a receiver at the breech, into which four charges, each in a steel case, are placed at once, and are carried into the barrel separately by cocking the piece. A Belt, 21 Shells, Wiper, Loader and Loading Gun, complete the Gun. This gun is highly recommended by distinguished sportsmen, and is easily managed even by boys. It is made by the Roper Repeating Rifle Company, Amherst, Mass., under the supervision of C. M. Spencer, Esq., inventor of the famous Spencer Rifle, who will furnish full circulars.

No. 60—Chest of Good Tools.—We continue, through the special favor of Messrs. PATTERSON BROTHERS, of 27 PARK ROW, the offer of chests of the very first quality of tools, of kinds and prices named below. The same tools could be purchased for half the money, but these are all A. No. 1, for practical use, and worth a dozen common articles. For this we have the guarantee of Messrs. Patterson, which is amply sufficient for us, and for all who know them. They make up assortments of these, or any part of them that may be ordered, at the prices named, and any one can purchase of them what they desire. We make up only a single premium, which contains a full assortment for all common purposes. The tools are of regular size, and but few additions would be required for a Journeyman Carpenter. The assortment of our premium is as follows: Plain chest, 31x16½x16 inches, with sliding compartment box, \$7; Jack Plane, \$1.60; Smooth Plane, \$1.45; Jointer Plane, \$2.55; Hand Saw, 25 inches, \$1.75; Compass Saw, 10 inch, 70c.; Compasses, 6 inch, 60c.; Warner's Hammer (adze eye) \$1.50; Hammond's Hatchet, 35c.; Draw Knife, \$1.25; Try Square, 6 inch, 50c.; Bevel, 5 inch, 50c.; Chalk Line and Sash Cord, 50c.; Mallet, 50c.; Pair of Pliers, 3 inch, 35c.; Sliding Trowel (puncher), 35c.; Augur Bits for Brace, ¼ inch, 25c.; ½ inch, 45c.; ¾ inch, 75c.; Center Bits, 1 inch, 25c.; 2 inch, 45c.; 3 inch, 60c.; 4 inch, 75c.; 5 inch, 90c.; 6 inch, 1.00; Six Gimlet Bits, assorted sizes, 35c.; Three Gimlets in Handles, assorted sizes, 50c.; Screw-driver Bits, 50c.; Flat Countersink Bit, 25c.; Rose do, 25c.; Sun do, 25c.; Square do, 25c.; Augur, 30c.; Taper Bit, 50c.; 3 inch Screw-driver in Handle, 50c.; 6 inch do, do, 40c.; ½ inch Handled Gouge, 50c.; ¾ inch do, do, 60c.; 1 inch Handled Chisel, 50c.; 1½ inch do, 60c.; 2 inch do, 60c.; 2½ inch do, 80c.; 3 inch do, 80c.; 4 inch heavy Framing Chisel, \$1.10; 1 inch do, 25c.; 1½ inch do, 35c.; 2 inch do, \$1.50; ¾ inch Augur, 60c.; 1 inch do, 70c.; 2 inch do, do, \$1.30; full set of Brad-awl, Rasp, and Common do, 50c.; 1 inch do, 35c.; 2 cornered, 50c.; do do, 25c.; Flat File, 50c.; Wood Rasp, 50c.; Soldering Iron (copper) \$1.15; Solder, Nails, etc., \$1; Total, \$44.50.—The Chest, locked, is sent as freight or otherwise, and the key by mail.

Nos. 61, 62—Mathematical Instruments for Draughting, Drawing, etc.—Very convenient, not only for Architects and Engineers, but for farmers and others, and for Boys and Girls. These are neatly fitted in beautiful Rosewood Cases, having

dividers with flexible joints, and points, semi-circles, pencil and penholders, rulers, etc., etc. All the pieces in No. 61 are finished in brass and steel; those in No. 62 are German silver and steel. The pieces are the same in each, but No. 62 is of extra beauty and workmanship. They are useful in making drawings, plans of buildings, fields, etc. They are valuable to children, to cultivate a taste for, and habit of observing and sketching farms, plotting fields, orchards, buildings, for drawing, etc. Such "playthings" keep them from "mischiefs," develop their minds, and make them "handy." Sent by mail, postpaid, to any place in the United States.

Nos. 63, 64—Dawson, Warren & Hyde's Gold Pen—With EVER POINTED FINE, IN EXTENSION CASE SILVER CASES. Premium No. 63 contains the best E Gold Pen, and No. 64 the best F Gold Pen, which is the same style, but larger. These pens are made by Messrs. Warren & Spaldone, No. 4 Maiden Lane, N.Y., successors to Dawson, Warren & Hyde, whose pens obtained so wide and good a reputation that the original firm name is the Trade Mark, and is still stamped upon every pen made. We have known the makers and their goods for many years, and can recommend both to our readers. W. & S. are the largest manufacturers of Gold Pens, Silver and Gold Pen Cases and Holders, in this country. States whether stiff or limber point is desired, and if the Pen received does not suit the hand, it may be exchanged at a trifling expense for postage.

Nos. 65, 66—Mercurial Barometers.—WOODRUFF'S PATENT, made by CHAS. WILDER, Peterboro, N. H. These are the most convenient and portable Mercurial Barometers made. Sent to Mr. Wilder for a circular giving engravings and descriptions of the instruments. The peculiar form of Mercury cup invented by Mr. Woodruff renders these far more portable than any Mercurial Barometer previously known. They are so easily carried that Mr. Wilder guarantees the safe delivery of every Barometer given by us as a Premium, if not to be sent beyond the Rocky Mountains. The instruments are beautifully made, are about 3 feet long, and are packed and sent direct from the factory, with no expense save the express charges. We offer two forms which differ mainly in the style of case, both being supplied with *Thermometer and Ventilator*. A Barometer is to farmers, or others on land, what it is to sailors at sea—an indicator of the weather to be looked for. Many who have received this premium from us in former years have given us definite statements touching its great value to them. Aside from its direct utility, the habit of observation and of scientific study, cultivated in children where a Barometer is used, is important.

No. 67—Buckeye Mowing Machine.—The Buckeye Mower is so widely and favorably known that we need not describe it particularly. Messrs. Adiranda, Platt & Co., 105 Greenwich-st., N. Y. City, will send any one a circular giving full description, engravings, etc. The experience of last year shows that many a farmer can easily secure this premium by a very few days' or odd hours' and evenings' canvassing for subscribers. A few can unite their efforts, each getting a part of the subscribers, and then own the machine in common.—It would pay a man well to canvass for this premium, and sell it. Ten subscribers a day for 15 days would secure the premium, which sells regularly for \$125.—Many can, at town meetings, fairs, elections, and other gatherings, or during evenings, easily secure this premium club.

No. 68—Cylinder Plow (Allen's Patent).—We hear very good reports from those who received this premium last year. It is named from the peculiar form of the mould-board. It is an Ohio invention, but is manufactured by the well-known firm of R. H. Allen & Co., 189 & 191 Water-st., New York, to whom application may be made for descriptive circulars, etc. There are several sizes of the plow, with a greater or less number of attachments. The kind we offer for premiums is the "Two-horse size, cutting a furrow 12 to 11 inches wide, and 5 to 8 inches deep." It is provided with wheel, and with a "skim plow," like the double "Michigan plow."

No. 69—Collins & Co.'s Cast Steel Plows.—These excellent plows are made by a patented process, of cast-steel recast (not rolled), tempered and polished like a good axe. They will come in the softest soils, and are great favorites on the prairies. The canvasser has his choice of eight plows named in the manufacturers' circular at the same price (\$25), of which we particularly recommend "C. No. 3" for general use; "B. No. 12" for stubble only, and "E. No. 12" for turf only. Send for circular, giving full particulars, to Collins & Co., No. 212 Water street, New York.

No. 70—Page's Patent Pump and Sprinkler.—A Hand Watering Pot, a Green-house Syringe, a Light Force Pump, and Garden Engine. It is very simple in construction, light to carry, easy to operate, and adapted to a great variety of uses—convenient for

washing windows, or blinds, carriages, horses, watering plants, etc. Throws a small stream with considerable force about 40 feet, and will be invaluable in case of an incipient fire. By a very simple arrangement, the stream can be quickly changed to drops, spray, or mist. Manufactured by the New England Portable Pump Company, 11 Hanover-st., Boston, Mass. Send for Circular.

No. 71—Family Scales.—These scales, combining the advantages of counter and platform scales, are peculiarly adapted to household purposes. They weigh from 1½ ounce to 340 lbs. They have a scoop and pan for weighing flour, sugar, and other house stores, and a platform for heavier articles, and are just such an apparatus as is needed for in-door or out-door use, occupying less than 2 feet space. In cooking, preserving, keeping the weight of the grocer, butcher, etc., and in weighing meats, butter, and other produce sold from the farm, they will save much more than the cost of obtaining them as a premium. These scales are manufactured by the well-known Fairbanks & Co., whose weighing apparatus has long ranked as the standard, and who received the highest premiums, two medals, at the Paris Exposition.

No. 72—Crandall's Improved Building Blocks furnish a most attractive amusement for children. They are very simple in construction, will stand years of children's handling without breaking, and give renewed pleasure daily. Churches, Dwellings, Barns, Mills, Fences, Farmsteads, etc., in almost endless variety, can be built with them, and the structures resemble so firm as to be carried about. For developing the ingenuity and taste of children they are unequalled. The Blocks are put up in neat boxes, and with each box is a card giving various designs of buildings. The Premium sets are plain. The same blocks may be had, maple finished, by sending 30 more subscribers, at \$1.50 each, or 10 more, at \$1 each. Send for a descriptive show-bill.

No. 73—Pocket Lanterns.—A very ingenious valuable Yankee invention—a complete Lantern, large enough to afford light for walking or other purposes, yet in half a minute it can be folded into a parcel 3 by 4 inches long, and 2 of an inch in thickness, or small enough for the vest pocket, yet contain 3 little spirit candles, matches, etc. We have used one for years, carrying it in the pocket on going out at night, ready for use at any moment. It is manufactured by the Merriam Man'g Company, (Julius Ives & Co., Agents, 40 Maiden Lane, N. Y. City.) A dozen pack in a box 3½ by 5½ by 8½ inches.

No. 74—American Cyclopaedia.—ARLETON'S NEW.—We cannot commend this great work too highly. We wish it could be placed in every family in the country. Several were fortunate in securing it through our premium list last year, and we hope many more will do so this. Such as our Academies and Seminaries, and members of Library Associations, can easily unite their efforts and secure it. Young men should devote evenings and spare hours to canvassing for this magnificent and useful premium for their own use. The Cyclopaedia is a *whole Library of itself*, consisting of sixteen very large octavo volumes, well bound, averaging 800 large two-column pages in each book, or in the whole, 12,804 pages! They treat upon 25,000 different subjects. It is hardly possible to say any subject, any country, any person, of note, in past or recent times, concerning which pretty full information may not be found in the Cyclopaedia. It embraces every topic of human knowledge, alphabetically arranged for reference,—is worth a year's effort in raising subscribers.

No. 75—The Great Dictionary.—WORDSWORTH'S LARGE PICTORIAL UNABRIDGED EDITION, containing 1854 three-column pages, with a multitude of illustrative engravings. (The work is 12 inches long, 10 inches wide, and nearly 4 inches thick, and weighs about 10 lbs.) Many of the most thoroughly educated men of the country consider this to be the best note to carry in the English Language. It gives the spelling and pronunciation of every word in the language with full explanations, and as a source of general information stands next to the Cyclopaedia. The Dictionary can be called for at our Office, or be sent by express or otherwise, to any part of the country. We have given away hundreds of copies as premiums, many of them obtained by quite young boys and girls. It should be in every family. It is published by Brower & Tileston, Boston.

Nos. 76 to 81—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with the Index to each volume.—They are profusely illustrated, the

Engravings used in them having alone cost about \$30,000. Those obtaining premiums for less than two volumes can select any volumes desired, from XVI to XXVII, inclusive. For ordinary use, the sets of numbers unbound will answer quite well.—Many hundreds of these volumes are taken every year as premiums.

Nos. 82 to 87—Bound Volumes of the Agriculturist.—These are the same as Nos. 76 to 81 above, but are neatly bound in uniform style, and cost extra for binding and postage. Sent post-paid.

Nos. 88 to 99—GOOD LIBRARIES.—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums \$8 to \$9, may select any books desired from the list below, to the amount of the premium, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them, \$25 or \$50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. Any good book will, in the end, be of more value to a young man than have an extra acre of land, or coming to himbook. The thinking, reasoning, observing man, will certainly make more off 60 acres, than he would off from 50 acres without the mental ability which reading will give him.—Our premiums will enable many a family to secure a larger or smaller Library. Let the Farmers of a neighborhood unite their efforts and get an agricultural Library for general use.

No. 100—General Book Premium.—Any one not desiring the specific Book premiums, \$8 to \$9, on sending any number of names above \$3, may select Books from the list below to the amount of 10 cents for each subscriber sent at \$1; or to the amount of 80 cents for each name sent at the (ten) club price of \$1.50 each; or to the amount of 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid, through by us.

BOOKS FOR FARMERS AND OTHERS.

[For sale at the office of the *Agriculturist*, or they will be forwarded by mail, post-paid, on receipt of price. All the books are included in the above Nos. 82 to 100 above.]

[COPYRIGHT SECURED.]

PERCHERON STALLION—IMPORTED BY JEFF. K. CLARK, ST. LOUIS, MO.—Drawn and Engraved for the American Agriculturist.

The interest excited in Percheron horses by articles which appeared in the *Agriculturist* some time since led Mr. Jeff. K. Clark, of Missouri, who was on the point of starting for Europe, to give especial attention to these horses while in France. He returned a few months since, bringing with him two stallions and two mares, which we saw while in New York, and were so struck with the beauty of one of the stallions that we had him photographed and engraved for the *Agriculturist*. The horse is five years old, 15½ hands high, of

a nearly uniform dark iron-gray color, obscurely dappled. He is an animal of immense power, and very solid and heavy for his height; not fat, and not in the least lanky in his gait; spirited, but docile and gentle. The photograph not only represents the horse correctly, but also the yard in which he was kept for several days. White spots on the back and shoulders indicate old harness galls, and that, as a colt, the horse was put to hard labor. This is, and for hundreds of years has been, the custom in Perche, and thus, it is claimed, a natural selec-

tion of the best breeding animals is constantly made; for, of course, those, both horses and mares, which cannot stand the hard, steady work they are put to, are not used as breeders. Even the young stallions are constantly managed and worked by women, and thus, in the course of generations, a docility and mildness of disposition become inbred, which is one of the most interesting peculiarities of this breed. We are exceedingly pleased with the Percherons, and fully believe that they are destined to be of great service to our agriculture.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrolyte plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 26, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, nearly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

A Year of 13 Months.

Every New Subscriber to the *American Agriculturist* for 1869, whose subscription comes to hand during November, will receive the paper for December without charge, if the name be marked new when sent in. Take Notice, that this offer extends to All New Subscribers, whether coming singly, or in Premium Clubs, or otherwise.

AMERICAN AGRICULTURIST.

NEW-YORK, NOVEMBER, 1868.

The excitement and hurly-burly attendant upon an election for President of the United States will occupy the heads and hearts of a great number of our readers, so that those who come to these columns for advice, or to be reminded of the work before them, will very likely not take up this number until it has lain a week upon their tables. After the momentous question has been decided, the news read, re-read, well pondered, and the whole nation has settled down quietly and accepted the decision, then the farmers will have to bestir themselves to make up for lost time, before the setting in of winter. It is a bad plan to be in a hurry; even the farmer who has only one pair of hands to keep employed should have definite plans, and work according to them. Of course it is vastly more important for those who give employment to several laborers to lay out their work well ahead. Winter will come among the mountain valleys and forests of the North, while we, perhaps, are enjoying the bland, bracing weather of the late autumn. Sleigh-bells will jingle and keep time to the pace of mettlesome horses, dashing over frozen roads with happy sleigh loads of parents and children at Thanksgiving time in one State, while the children of another celebrate the same festival in summer clothing, playing upon the lawns, or rambling in search of nuts in the grove. Nevertheless, irresistible winter slowly and surely marches onward, and we should all be ready when he comes.

The harvests are abundant; prices of farm produce rule high; there is no pressure of famine, and short stock of any of the necessities, and hardly of the luxuries of life; our nation is bearing up manfully under what our enemies predicted would be a crushing load of debt, gradually paying it off; and upon every side evidences of personal and national prosperity meet us. With these blessings come responsibilities and accountabilities which we cannot avoid. This month, closing as it does the farmer's year of toil in the fields, and filling his heart with gladness, should remind us that we are not alone in the world, that all are not prosperous, so that receiving freely we should remember the good Giver, in bestowing freely of our surplus.

Hints about Work.

The order of farm work at the North is, first to secure crops still in the field, before freezing weather; second, to protect those already in store, as well as houses, barns, and manure stores from damage from any source; third, to put the farm in order for a sudden freezing up. Early winters come now and then, and shut down upon farm work just when a day or two more of out-door labor would save the labors of months, perhaps, from loss.

Root Crops.—These continue to grow as long as the ground is open, but it is a poor plan to trust too long to the weather. No date can be fixed applicable to different latitudes, but at the North it will be wise to lose no time after the first of November, in harvesting roots of all sorts. *Parsnips* will not be injured by the severest freezing, though they may be frozen up and not be available before next spring. They are wintered thus as soon as the ground opens. *Rutabagas* will bear more frost than white turnips, but neither should

be subjected to severe freezing. *Mangel* and *Sugar Beets*, though they bear, perhaps, an equal degree of cold without apparent damage, yet if they stand in the ground after they cease to grow, they become tough and woody, and roots exposed to freezing, if not used soon, decay at the crown. Growth ceases with beets after a few sharp frosts; hence they should be dug and housed early. *Carrots* are also liable to injury from freezing, and the first frost that stiffens the soil should be a signal to harvest beets and carrots with alacrity, if not already done.

Patatoes.—In parts of the country where the digging of potatoes has been delayed, or where it is safe to wait so long as November, digging should be postponed no longer, but this valuable crop housed at once, or placed in frost-proof pits, such as were described in the *Hints for Work* last month.

Winter Grain.—Top-dressings are sometimes recommended for application early this month. These are of two kinds. One acts chiefly as a mulch, and is often very useful. Poor composts of sods, peat, etc., made with but little manure, or with lime, ashes, guano, fish manure, eastor pomace, or something of that kind, if they have lain until fine and uniform, may be spread on pretty liberally, and the ground rolled. Guano or some fine "hand manure" may be sown on to quicken the growth of late crops, and to promote tillering when the stand is thin. Do not trust a common farm hand to plow the water furrows or surface drains about or across grain fields. Keep them nearly on a level, but with a uniform, slight fall.

Housing or Stacking Corn Fodder.—Corn stalks dry so slowly that it often takes all the fair weather of autumn to dry them. It is rarely safe to leave them in the field after the middle of the month, and they make much better fodder if housed as soon as they are dry enough. Whether in stacks or under "barnicks," lay the bundles with the tops inward, and inclined slightly upward, so that rain and thawing snow will all be carried off.

Buildings.—Look well to the roofs, eave-troughs, and weather boarding of all buildings. Where every thing is not snug and tight, a few nails will add greatly to the durability of barns and sheds. If *Stables* have only single outer walls, line them with hog hay, or other litter, stuffed between an inner boarding or lathing and the weather boards. This is a favorable season for outside *Painting*, as the weather is seldom so dry as to be very dusty. New paint is not disfigured by small insects, flies, etc., sticking to it, as often happens at other seasons.

Roads.—Employ spare time of men and teams in putting the farm roads in good repair, and protecting them against washing during thaws or rains.

Fences.—Tear away all fences not absolutely necessary. We believe that small farmers who keep only four or five head of cows and heifers can well afford to get chain-tethers for their animals and keep them tethered while grazing, rather than be at the expense of putting up many interior fences. Grain fields must be securely enclosed, and fences between neighbors and along the highway should be looked to, before the ground freezes, and weak posts strengthened by stakes, or reset.

Manure may be carted out if it can be spread and plowed in, or put into compost heaps with sods or muck, or even put in heaps and covered with two or three inches of soil. The swamps and roadsides, old fence rows and the woods, should contribute to the supply of material for composts to be made now, or to be worked up during the winter by mingling the vegetable mold with manure as it accumulates. To get rich, fine manure for spring grains, flax, garden use, and many other purposes, build up heaps, consisting of alternate layers of straw stuff, fresh manure, and litter, from the stables, and wet the whole now and then by pumping barn-yard liquor over it to saturation. It will all rot down before spring, and become fine and uniform. See article on sheltering manure, on page 408.

Hogs gain flesh and fatten very rapidly during most of this month. Feed regularly all they will eat, and only ground or cooked grain. Every few days it is well to mix a few handfuls of charcoal and ashes from a wood fire with their food, or to

throw them a little charcoal dust and corn mixed and slightly moistened. It keeps them in good condition, and sharpens their appetites. After hogs are fat enough to kill it is easy to keep them so a while, even in severe weather; but when it is very cold they must be in very warm quarters or they will eat a great deal and not gain a pound. This month is the time to prepare for a litter of pigs in March. These will be old enough to consume their share of milk when the cows come in.

Sheep should have dry sheds, sunny yards, and be fed from racks and troughs. Graining should commence as grass fails, and the flocks should be so divided that those placed together are of about equal strength. The high price of linseed cake and meal will prevent their use to a great extent. Corn is the natural substitute, and a good one, but it must be used with greater caution. Keep sheep constantly and gradually gaining. Ewes served in November will yearn in April; that is, in 150 days.

Horses.—It is a good plan to give farm horses the range of weedy stable and other fields late in the season. They eat a great many weeds as other forage fails. We keep our horses too warm, as a rule, for the sake of giving them smooth coats. Make it a rule never to give a horse feed or water until he has stood an hour after coming in off the road or from hard work. Rub him down as soon as he comes in, throw a warm blanket over him, and remove it when he is fed or within an hour. Never leave a warm horse to cool off in drafts of air or in the wind out-of-doors. A horse stable should be light, airy, and roomy. A horse that does nothing will do well on hay alone, watered twice a day, and groomed twice a week. If he is used, groom daily. Keep the stable always clean.

Beef Cattle.—This season is the best in the year, perhaps, for putting flesh upon beves. They must be fed at each meal all that they will eat with a relish and digest thoroughly, so as to be hungry when the time comes for feeding again. All success, we may say, depends upon appetite, and this upon health. It is promoted by an occasional change of diet, by the use of the eard and curry-comb, but above all by punctuality in giving stalled cattle their feed. Litter well and save every drop and particle of manure value. These are the feeder's principal profits. Keep the stables warm but the air pure. Quiet and darkness are important.

Cows.—Keep them quiet. Feed corn stalks cut fine, soaked 12 hours, with meal upon them. If possible, keep water before cows all the time. See article on butter making. It will pay those having good, warm milk-rooms to make butter all winter. We are in the habit of drying our cows off very much too early. To make butter, however, will require liberal feeding with corn meal, rye bran, cannell, or something of the kind.

Orchard and Nursery.

Fruit is much accelerated or retarded in ripening by the temperature. That will keep best which is subjected to few alterations of temperature, and has been as cool as may be without actually freezing.

Ripening is an interesting process; it is the first step towards decay. Changes go on in the fruit after it is picked, quite as important as those which occur at any other time. Not only do the access of air and the temperature affect the fruit, but the fruit in ripening affects both air and temperature. Oxygen is absorbed, carbonic acid given off, and heat produced. Open the fruit cellar or room whenever the outside temperature will allow, provided it is not warmer within than without.

Planting may often be done this month, but on no account set trees in wet or partly frozen soil. It will be much better to heel-in the trees in a dry, sandy spot, unless the soil is in a condition perfectly well suited to receive them.

Cider is still to be made. See page 359, last month.

Vinegar.—Convert all inferior fruit into vinegar; it will pay better than to turn it into pork. See article on vinegar making, last month, page 367.

Stocks for root-grafting are to be taken up, assort-

ed, and tied in bundles of convenient size, and either buried where they can be got at when needed, or, what is better, packed in boxes of sawdust of its natural dampness, and placed in a cool cellar.

Clons may be cut at any time when the wood is not frozen. Store them in sawdust and see that it does not dry out, and that the boxes are kept cool.

Seedlings will need protection, but this should not be applied too early. Nature uses leaves, and nothing better has yet been proposed. In the absence of these, use boughs of cedar or other evergreen.

Fruit Garden.

See last month's notes, as well as those given above under orchard.

Pears of the choice kinds, that have been well kept, now bring a good price in market. It will pay to pack fine specimens of *Beurre d'Anjou*, *Duchesse d'Angoulême*, and such high-priced kinds, in cheap boxes holding a single layer of fruit, and wrap each pear in some very soft white paper. A good pear is such a royal thing that it cannot be treated with too much attention.

Covering of all plants, whether of raspberries and grape-vines with earth, or strawberries with straw or other material, should not be done too soon nor delayed too late. Try to catch just that time when winter sets in, and the ground is about to freeze.

Root Cuttings of blackberries, raspberries, and all plants propagated in this way, are to be made. The whole story is: cut the roots in pieces two to three inches in length, and pack them with earth in a box. If the box be at all tight, make holes to allow any moisture to drain off, and bury it in a place deep enough to be safe from frost, and where no water will accumulate. If the spot be not naturally dry, put in a drain of some kind.

Cuttings of currants, gooseberries, and quinces, may be planted. We have often given directions for the best treatment of cuttings of this kind. One condition of success is that the soil be closely pressed against the lower ends of the cuttings.

Grape-vines.—It is better to prune these now, but they may be left until very early spring. We are often asked "How shall I prune my grape-vine?" The question is as difficult to answer as it would be for a doctor to prescribe merely upon the information, "My wife is sick, what shall I do for her?" Each vine must be treated according to its individual needs, no matter what "system" of pruning is adopted. In view of these frequent queries, we have written a series of articles, extending nearly through the whole year, the main object of which has been to show the reader, in the first place, how the vine grows, and secondly, to set forth that all systems of pruning depended upon this knowledge. An intelligent person upon looking over the articles mentioned cannot go far wrong, and we refer to those for general principles. How to prune,—the merely mechanical art,—will depend upon how much is to be done. Where there are many vines, one of the very clever pruning shears, now sold by dealers in implements, will be found best, but a good knife will do. It is safer to leave one more bud than is needed on each cane; i. e., if two shoots are wanted in a place, leave three buds. When the severity of winter is over, say in February, go over the vines and remove the extra bud. In all pruning do not cut too close to a bud, but leave about an inch of cane above the last one.

Grape Cuttings.—The wood resulting from pruning may be used for propagation. It should be kept cool and from drying. There is a great difference in varieties as to the ease with which they may be propagated. The management of difficult sorts was described in November, 1867, page 469.

Kitchen Garden.

Follow the suggestions given last month, concerning the preparation of the soil. Have every foot spaded or plowed that can be done. Sod land, intended to be used for garden crops next year, should be heavily manured and plowed. Put down drains, if needed, and the weather serves.

Asparagus Beds are to be covered with coarse manure, or with straw or other litter.

Roots placed in pits as directed last month are to be covered with earth only when the weather renders protection necessary. The hardier roots, such as parsnips and horseradish, may be dug as long as the ground is not too much frozen.

Manure.—Success in gardening depends in the main upon not only generous, but heavy manuring. For an excellent method of increasing the stock, see the notes on farm work and various articles scattered through our pages. There is an important item, night soil, usually neglected. For the method of converting this into valuable poultice for the garden, see article on page 410.

Rhubarb is better transplanted now than in spring. It may be done as long as the ground remains open. This plant needs an abundance of manure.

Cold Frames.—Cabbages and other plants wintered in these are often killed by too much heat than by the cold. They will endure a moderate freezing without injury. The sashes should be put over the frames at night only, unless the weather becomes colder than usual this month.

Celery may be stored in trenches—or left still later if it can be banked up with earth. The storing for winter is done in trenches a foot wide, and as deep as necessary to admit the plants. Set the roots close together, without any packing of earth, and when cold weather comes on, cover with straw.

Cabbages.—The best method yet devised for preserving these is to invert the heads and cover them with four to six inches of earth. This should be postponed as late as the earth can be worked.

Spinach will, in most places, need a slight covering, applied only when the ground begins to freeze.

Soil should be prepared for use in hot-beds next spring. It is often difficult to get it at the time it is needed, and it facilitates matters much to have a good heap in readiness. A light, rich loam is required, and if the garden soil is heavy, use a portion of sand. Let well-rotted manure form one-third the bulk. Incorporate the whole thoroughly, and place in a heap and cover with boards or soils.

Flower Garden and Lawn.

In this department there is little to add to our notes of last month, and many directions given then will prove quite timely now. In this, as in all other gardening, endeavor to do now everything that will save work next spring.

Planting of many things may yet be done, the rules governing the planting of deciduous ornamental trees and shrubs being much the same as already indicated under fruit trees and shrubs.

Bulbs should have been planted last month, but they may be put in now with good results. Bulbs of *Glaucolus*, etc., are to be taken up. Japan Lilies are quite hardy. Cover all bulb beds, new and old, with a good coat of coarse manure, applied when the ground begins to freeze.

Chrysanthemums will need stakes. Put those in pots, after their bloom is over, in a cool cellar.

Dahlia.—If these are still in the ground, take them up and store as directed last month.

Protect half hardy things as the weather gets cold, by the use of litter and evergreen boughs.

Green and Hot-Houses.

Sudden changes are to be guarded against, and as the sun still does a good part of the heating, fire will only be needed occasionally.

Insects.—Watch for and attack on their appearance.

Bulbs.—Bring a portion of the pots into a warm place, if they have made a good supply of roots.

Cannellus will need a frequent use of the syringe to keep the foliage healthy. Keep them cool.

Propagate, for winter blooming, a stock of rapidly growing things, if there are vacancies to fill.

Climbers are most useful in the green-house, and amongst these the *Tropeolums* are very valuable.

Annals may be sown, though the bloom will be late. *Mignonette*, *Sweet Alyssum*, and *Candytuft*, are always in request for bouquets in winter.

AMERICAN AGRICULTURIST.

ORANGE JUDG & Co., Publishers, 345 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

STILL BETTER!

AND FIVE

Most Valuable

PREMIUMS.

Open to all the world.—Anybody may get one or more of them.—Premiums offered for a definite number of names, so that one's success does not hinder another.—No competition, except for the single animals, and for these only to see who shall call for them first.—Enough Premiums of each kind (except animals) to supply one or more to every neighborhood in the United States, British America, and elsewhere.—Every article offered warranted of the very best kind, and true to the description.—Terms liberal, and conditions easy.—LARGE PAY for LITTLE WORK. Something for you, Reader!—Something useful and desirable for Farm, Garden, and Household—for Man, Woman, and Child.

The election excitement being now about over, we can all turn our attention to regular duties and business. The Publishers of this paper are at theirs. First, they are laying large plans for furnishing the best possible paper during 1869—one that shall be valuable to everybody—valuable for its great amount of useful, reliable information on everything that pertains to indoor and out-door practical life—to the young as well as to the old. They will provide beautiful and instructive Engravings, without limit as to number

and cost. In short, they will—guided by long experience, and with unlimited resources—aim to supply the best paper possible to be made.—Second, they will seek to place this journal within the reach of everybody. The price will be kept down to the lowest possible limits—depending, as heretofore, upon increased circulation to meet increased expenses.—Third, they will try to have everybody take and read the paper who will be benefited by it,—and who will not? But this is a great country, and though almost everybody knows of the paper, not one in ten knows its value, and how cheap it is. The Publishers, therefore, solicit the kind words and deeds of the present readers in making the paper known in every household. As an incentive, or reward, or recognition for aid of this kind, the Publishers offer a great variety of valuable presents or Premiums to all those who will give a little time (but very little is required) to increasing the circulation of the paper.

Please look over the table of Premium Articles, and the description of them published last month (another copy will be sent when desired,) select whatever is most wanted, and you can get it. We know these articles are all good, and take great pleasure in sending them out, aside from any pecuniary advantage derived. Thousands of letters of thanks have been received from those who have hitherto secured our various premiums.

Our list was very comprehensive last month, but we are now able to add some fine Devons (premiums 101 to 105—see descriptions) so that the list for 1869 is quite complete. We are ready to begin sending these premiums out at once—indeed, many have already obtained them. A Western Lady has secured a \$650 Piano since Sept. 1st for premium subscribers. All subscribers for 1869 can begin now, without additional expense. See page 394. Will you take one of these premiums, this year, Reader? Suppose you try and secure it during November.

EXPLANATION.—Our immense circulation enables us to do things on an extensive scale, and doing this, adds again to our circulation. We spend large sums for engravings, for collecting information, etc., and it costs no more for all these to supply half a million subscribers than it would half a thousand. There is but one office, one set of editors, engravers, etc., to be supported, and we can thus furnish a superior paper at an exceedingly low price.... We expend all the subscription money, and tens of thousands of dollars more, in simply getting up and furnishing the paper itself, and yet make a satisfactory profit, besides paying all the premiums. Our unprecedented circulation makes every line very valuable to advertisers, who gladly pay a large price to reach so many people—especially as they know we shut out humbugs and unreliable parties from our advertising columns. So our advertisements furnish money to pay premiums; the premiums get more subscribers; more subscribers add to the value of the advertisements, and thus we get more money for more premiums. The whole thing is simple, and only requires courage and enterprise to carry it out. Everybody gets a very good and very cheap paper; and thousands of people get good premium articles—just such as they want—simply by making up clubs of subscribers. Your opportunity to do this, Reader, is just as good as that of any other person in the world. What premium will you have? Further on we tell how to get it.

It Pays DOUBLY to try for our Premiums. A few odd hours' work, with a copy of the paper to show, will collect enough subscribers to secure one of the fine articles in our list. As a *business*, some Gentlemen, several boys, and many Ladies, canvassed for subscribers, received various premiums, sold them for cash, and made high wages. One Lady thus made \$1,200 in less than 6 months the past year. Others made \$150 to \$250 each, in single months.—Again, Everybody that circulates the *Agriculturist*, and thus gets more people to reading and thinking, is doing a good work for the country. Twenty-five copies circulating in a neighborhood will stimulate thought and enterprise that will soon increase the value of all the property in the place.

Presents.—Many persons make up clubs and secure our premium articles, as sewing machines, silver sets, etc., for presents to a wife or friend. Many neighborhoods make up clubs for sewing machines to be given to poor widows, or to a Pastor's wife. Scholars unite and get a Watch for a teacher, a Melodeon for their school room, and so on.

Read and carefully note the following: (a) Get subscribers anywhere; all sent by one person count together, though from one or a dozen different Post-Offices. But.... (b) Say with each name or list of names sent, that it is for a premium list, and we will so record it.... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any time, from one to six months, will be allowed, to fill up your list as large as you may desire. The premium will be paid *whenever* you call for it.... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts.... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers. N. B.—The extra copy to clubs of ten or twenty is not given where premium articles are called for.... (f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the 2c. prepaid postage, about 12 cents.... (g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums, Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post Office or express office nearest recipient), to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Oct. 14, 1898, and for the corresponding month last year:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.									
RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.									
26 days 1898.....	2,568,000	1,725,000	2,350,000	61,000	316,000	2,217,000	27 days last yr.....	2,590,000	431,000
26 days 1897.....	447,000	2,560,000	1,250,000	180,000	805,000	1,310,000			
SALES. Flour, Wheat, Corn, Rye, Barley, Oats.									
26 days 1898.....	27,000	2,119,000	2,038,000	152,000	215,000	1,761,000	27 days last yr.....	281,000	1,112,000
26 days 1897.....	441,000	1,802,000	2,911,000	320,000	—	2,916,000			
2. Comparison with same period at this time last year.									
RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats.									
26 days 1898.....	2,568,000	1,725,000	2,350,000	61,000	316,000	2,217,000	26 days 1897.....	447,000	2,560,000

is the same everywhere. What was done in 3,000 to 4,000 places last year, can be done in 25,000 places this year. The work will pay well, and do good besides. Every one read through the premium sheet.

The Department of Agriculture.

—There is every prospect that those who have been looking for a chance in the condition of affairs at the Department will not be disappointed. The Commissioner, Col. Horace Capron, evidently intends to make it both useful and creditable to the country. The offices have been removed from the crypt of the Patent Office building to a spacious new structure erected for their accommodation. Prof. Glover, who has already done so much under the most untoward circumstances, will here have ample room for his agricultural museum. The old propagating garden is to be given up, and Mr. Saunders will have abundant space in the grounds about the new building, not only for experimental work, but for a display of his taste in ornamental and landscape gardening. A number of acres have been laid out in the style of a park, which are to be planted as an arboretum which shall contain specimens of all trees hardy in the locality. These grounds are what under the name of an "Experimental Farm" were formerly so justly ridiculed. The chemist, Dr. Antisell, has a convenient and well-appointed laboratory. In the working force great changes have been made; a large number of hangers-on have been discharged, and these are of course opposed to the Department and its present administration. Every thing about the Department shows marks of energy and judgment, and we feel warranted in hoping that when the Commissioner and his assistants will have become fairly settled in their new quarters, they will be able to do good work for the agriculture of the country.

Two Very Complete Country Residences.

are now being finished by Mr. Judd, near his own Homestead, in Flushing. They have been erected partly as a source of amusement, and to exercise his own taste, and to show how many conveniences can be introduced into one's house with a moderate outlay; and partly to prepare houses inviting to good neighbors. They have all the conveniences of first-class city dwellings, and some not usually found there—especially country air and space, with churches and schools within walking distance; and though ten miles away, they are now quite as accessible to the business centre of New York by means of two railroads and ferries, as are most of the better dwelling houses on Manhattan Island. They will be shown with pleasure after Nov. 10th to any who may contemplate building and may wish to examine them. They will be sold on easy terms of payment. Price with lot, (125x140ft.) on a fine avenue, about \$14,000.

Sundry Humbugs.—Unsafe Oils.

For many years the *Agriculturist* has alone fought the legions of fraud and humbug. We, however, stood our ground, and when visibly gaining upon the enemy, aid came in the form of a law of Congress, late, to be sure, but welcome, in which sending forth gift concert circulars and all similar matters through the mails was made a penal offence. This law has been a severe check to operators in the gift line, and though they will probably find some way to get around the law, for the present they are on the retreat. These chaps will soon break out in a new place, but we shall try to follow them up, whatever colors they may fly. The gift-enterprise business is so far defeated that for a whole month we have seen no new phase of it. It is probably only a lull in the fight, but "for this relief much thanks." And Congress has our gratitude, as it should have that of the whole community of our readers, for the help it has afforded us and them. Villany assumes many shapes, of which the gift-enterprise is only one....Are the "One dollar" concerns, now becoming so plenty in N. Y. City and elsewhere, the honest, straightforward thing? Our readers must judge for themselves, and we trust that they will not be over-sanguine in rushing after these people of large promises. Van Allen and his Eureka Oil need to be again mentioned. We call attention to this subject for a double purpose. First, to denounce most strongly the use of a mixture of camphor and kerosene, because it is dangerous in the extreme. Both of the articles are volatile, and one forms a very explosive vapor. Why people will buy such stuff and burn it is beyond our comprehension, but they do so, and both life and property are sacrificed by their use. Secondly, we wish to bring to mind the law in the matter of dangerous oils. Congress has tried to protect the people in this respect by striking at the root of the evil. The law is found in Sec. 29 of Amendments to the Internal Revenue Laws, approved March 24, 1867. (See March, 1868, p. 88.) This act provides severe penalties for mixing for sale, or for selling any oil or burning fluid that will not stand the "fire test," as it is called. So little seems to be known about this very important subject that we will explain. The "fire test" is simply

this. Place a vessel of water on the stove and heat it to the temperature of 110° F.; put in another vessel (say a tin basin) some of the oil to be tested, and place this dish so it will float on the water, and let the whole remain a few minutes until the oil has been brought up to the temperature of the water. Now thrust a lighted stick into the oil; if the flame on the stick is extinguished, the oil is safe from explosion. If it burn, however, it is a dangerous oil, and its sale is prohibited by the law. Any person may find plenty of bad oil in his own town, but the U. S. Courts are not within the reach of the majority of sufferers, as time and money are necessary to get a case before those tribunals. Evil-disposed people are aware of this fact, and offer their vile compounds for sale regardless of the law. Rhode Island is first in supplying a much needed adjunct to this national law. In a code of State laws, she provides for appointing Inspectors of Kerosene with full power to prosecute any violation of the State law passed March 12th, 1867, almost immediately after the passage of the act of Congress. We have it from good authority that in the city of Providence there has not been a single accident from the explosion of kerosene since these laws went into operation, and that not a gallon of burning oil of any sort can be found on sale that will not stand the "fire test." So much for what good legislation will do for the protection of life and property. We entrust the authorities of every State so to supplement this act of Congress by State laws, and a system of inspection so rigid, that explosive oils of every sort may be completely banished from use.

A Brazen Swindle.

—One of the most brazen swindles we ever heard of is the one perpetrated by the "*Patent Butter Association*," 234 Broadway. This party actually had an office at the number given on Broadway, a little obscure room on one of the upper floors. They advertised to sell a powder, with directions for using, which would make one pound of butter from one pint of milk. They did sell a powder, which looks and tastes like cooking soda mixed with salt. The directions require that a pound of butter to each pint of new milk used should be placed together in a churn with some of the powder and churned until the butter comes. The result is that the good butter comes out white and almost spoiled, and weighs no more than when it went in. A moment's thought will show any one how impossible the claim is; for a pint of milk weighs only a pound, and it consists of more than 75 per cent of water to begin with.

Horticulture at the N. Y. State Fair.

—An immense tent served as the Floral Hall, which was all small for the crowds which were attracted to it. Mr. Jas. Vick, who superintended the department, deserves much credit for the substantial and proper arrangements for showing the fruits and flowers, as well as for a display of taste in such ornamentation as the tent allowed. The fruit occupied tables against the wall of the tent, and flowers were arranged upon an inner circle. The show of fruit was very fine, and, of course, Ellwanger & Barry were preeminent in this department. E. Ware Sylvester, of Lyons, N. Y., had some notably fine plants, though not as many as E. & B. The show of grapes was very good, and some exotic grapes of John Fisher, Batavia, N. Y., deserve special notice. The finest pears of any single variety were the specimens of Duchesse, from C. M. Bowen, Vineland, N. J. In flowers, Mr. Vick was resplendent; Frost & Co. had a valuable collection, and Mrs. Van Namee, without whom a State Fair would not seem half complete, was present from Chambersburg, Pa., with her favorites, which took several premiums. Vegetables, as usual at the New York Fair, had a poor place. They were in a dark building, among cooking stoves and other things, and had to take their chances. The show was interesting, but we cannot commend it as being particularly fine. The chief attraction was the 150 varieties of potatoes exhibited by Reigis & Hexamer, Newcastle, Westchester Co., N. Y. Whether it was the potatoes or Doctor Hexamer himself, we cannot say, but the two together always had a crowd about them. C. F. Crossman, seed-grower, of Rochester, had a noticeably fine collection of garden vegetables, including many things not often seen on exhibition.

The Orange Judd Wheat Prizes.

—Feeling that wheat had not hitherto received that attention at the N. Y. State Fair that its importance demanded, Mr. Judd placed at the disposal of the N. Y. State Agricultural Society, \$300, to be offered as special premiums for wheat. It was hoped that this offer would bring out a fine display of grain and allow the many farmers who would visit the fair to see what could be done in the way of wheat culture. Two of the editorial staff of the *Agriculturist* were at the Fair, and each, without the knowledge of the other and without consultation with him, wrote down the wheat affair as a failure. Mr. Judd paid \$300, and no one save the recipients is in the least

benefited. He will probably never enquire who engineered the matter, and we will simply state what was done, to show what should not have been done. The premiums were coupled with such conditions that only thirteen entries were made, and of these only three exhibitors complied with all of the requirements. The premiums were awarded to these three, while there was vastly better grain present, but the exhibitors of it failed to show the stalks as required by the conditions. The premiums were not awarded until the last day of the fair, and the general public could not know which were the prize samples. Had the premiums been awarded earlier, the arrangements were such as to prevent any one from seeing the grain. A large pen was raffled off, at the further side of which the barrels were placed, and the grand crowd which poured by were treated to a view of a very nice looking lot of barrels, headed and unheaded. There was no wheat to be seen at all. Mr. Dietz, the celebrated grower of seed wheat, made a most useful show outside the railing that the Society allowed the Judd wheat to make. This is what was done, and our readers will agree with us that if this is the way in which special premiums are to be managed hereafter, there is not a very strong inducement held out to any one to offer them.

Olm Brothers.

of Springfield, Mass., have a very fine collection of plants. In July last we figured some rare Begonias from their collection, and specimens of green-house plants we have received from them since show that they have all the new and choice things as soon as any one. We congratulate the citizens of Springfield upon having a first class horticultural establishment in their beautiful city, and hope the Brothers Olm will meet with the success that their skill and enterprise merit.

The New Jersey State and Central Fairs.

—The agriculturists of New Jersey are unfortunately not being able thoroughly to co-operate in one organization. There are several county agricultural Societies which make very creditable shows every year, and promote, so far as they can, improvement in agriculture. The New Jersey State Society is such only in name, and while it has the most attractive location we perhaps ever saw, puts forth an excellent premium list, and its officers make judicious efforts to have it take a high rank, it makes really but little more than a good county show. The N. J. Central Society was established, we believe, during a period of suspended animation on the part of the State Society, and this too has fine grounds and buildings, a good mile track, etc., pleasantly situated near the State capital. The offer of premiums was liberal, but the exhibition just about what would have been a credit to a good populous county. The subject requires legislation, we should say, for a State of such varied and interesting agricultural products, and so situated that every part is easily communicated with, ought to have an agricultural Head Center, and this individual or organization, Board or Society, should enjoy the hearty co-operation of all the county and district Societies and of all the go-ahead farmers in the State.

Manhattan Cooperative Relief Association.

—We had no cause to impugn the good faith and good intentions of the parties advertising this Association, or if would not have been admitted to our columns. The many inquiries from our readers led us to study the scheme somewhat, and though it has various good features, we are not prepared to endorse it. The first objection that occurred was that the annual death rate was placed too low. If only "300" died each year, it would take 166½ years for the 50,000 persons in any class to die off! There are sundry other objections which might be named had we space.

Norway Oats.

claimed to weigh 40 to 46 pounds to the measured bushel, really weigh 32 pounds, as sent out by the agents. This is exactly a bushel by weight, as established by law in most of the States.

Sense at the Farmers' Club.

—Once in a while there is a ripple on the sluggish stream of talk at the Farmers' Club, which gives a little variety to the reports. A committee was appointed to visit the Walter Grape on the vine, made up after the tadpole fashion with Horace Greeley for a head and dwindling down to a very small tail. Such a burlesque on grape committees was too much for Mr. Quinn, who asked: "Why is it that no man is appointed on that committee who has made grapes a study? We have plenty of such men, but I do not see their names mentioned here." Mr. Quinn should not ask impertinent questions. He evidently is not in the rig.

Early Corn, Late Planted.

—Mr. H. C. Redfield of Metuchen, N. J., shows us a sample of his crop of yellow 8-rowed Canada corn, planted June 20th, ripe and fit to shell October 12th. This is quick work,

A Good Seed Bed on Sward Land.

—“F. W.,” Morristown, N. J. “How shall I harrow so as not to bring up the sods and make a rough surface?” A good seed bed upon sward land for winter grain is a matter of great importance, especially if the seed is put in with a drill. A good deal depends upon the plowing. With the Michigan plow, which entirely buries the sod and brings to the surface 1 or 5 inches of loose soil, there is no difficulty. The swift plow, turning the furrows all one way, also makes a smooth seed bed, if the harrowing is skillfully done. The harrow should first be run lengthwise of the furrows, to press down and level the sods. Then harrow crosswise in the direction in which the furrows are laid, and go back in the same track. By this method no buried sods will be brought to the surface, and a good seed bed will be prepared.

When to Thrash and Sell Grain.

—“L. D. B.,” Northampton, Pa. “What are the prospects for the grain market the coming winter?”—About all that can be said now is that we have abundant crops, and there are short crops in Western Europe. As a rule, a farmer does well to thrash and sell his grain early, if he can get satisfactory prices. Few farmers can afford to speculate in articles so liable to waste as grain. It is liable to be damaged by the weather while in stack and by rats and mice both in stack and in bin. If changed into cash it begins to draw or stop interest at once.

The Frost Improving Soil.

—“Is there any proof that the soil is benefited by frequent freezing and thawing?”—“B. F. M.,” Vineland. This is easily tested by ridging a few square rods in the garden either with the plow or spade, thus exposing about twice the average surface to the action of the frost. If land thus treated is more productive than that which lies undisturbed, the frost makes the difference. We know it to be beneficial, and especially so to heavy loams and clay soils.

Alsike Clover.

—“N. T. S.,” Colchester, Vt. “Can you recommend Alsike clover as a forage plant?”—We have not sufficient acquaintance with the article to do this. It was introduced into the country by the Patent Office in 1893, but seems to have made very little progress, catching something of the spirit of the officials that introduced it. It is said to be best adapted to strong, moist soils, sows its own seeds, and will last a dozen years or more. If the seed, sold for a dollar a pound or upwards, we should stand some chance of learning more about it.

Stone or Wood Fences.

—“G. D. C.,” Lyme, Ct. “I have occasion to build about 100 rods of fence this fall and winter, and have both stone and wood upon the farm. Which will pay best in the long run?” Stones, unquestionably, if they are in the soil and need to be removed from the surface. This has been the opinion of Eastern farmers from the first settlement of the country, and it is still better economy now that we need smooth fields for improved implements of tillage and harvesting. A well-made stone wall with the foundation put below frost will cost more than a rail fence, but it will last many times as long without repairs and when these are needed the material is still good for resetting. The wood fence needs attention every spring and after a few years is only fit for fire-wood. We have quite too many fences upon our farms, but if they must be built, use stone and make them permanent. This looks as if we meant to stay while we live and to leave our farms to our children free from the expense of fence-making.

Muchness of Land.

—“How much land ought a farmer to own?”—“A. H. L.,” Spencer, Mass. “Ten acres is enough” for some people, and is more for them to manage than a thousand acres for others. A man may safely own just as much land as he can make pay six per cent and upwards on the capital invested in it and in its cultivation. Six per cent is the lowest legal rate of interest in any of the States, and probably it is a fair average of the profits of all kinds of business. Some men have skill enough to make their land pay ten per cent and upwards. But the great majority of our farms do not pay five per cent, and many of them not even three. We recently visited a district of cheap lands and poor farming, in one of the older States, which furnishes good examples of “muchness of land.” One farm of 32½ acres of land rents for \$290, and the owner pays \$60 taxes on it, leaving only \$190 for the use of the farm. It is valued at \$7,000, and is probably worth that to any man who knows how to work it. But the owner gets only two per cent on his capital, or 56 cents an acre for the use of the land. The tenant keeps a dairy and sheep, pays his rent easy, and gets something more for his labor than he would to work by the month, but is not doing a very profitable business. The farm might easily be made to

clear a thousand dollars for its owner, for it is a good grain soil, and has admirable facilities for making manure. Another owns a farm of a thousand acres, which he rents for \$1000. The farm was purchased some 15 years ago for \$20,000. Deducting taxes, the owner gets about four per cent for his capital and one dollar an acre for the use of his land. The tenant keeps a dairy of 38 cows, and a good many young cattle and working oxen, in which he trades, perhaps a hundred head in all through the grazing season. He clears perhaps \$2,000 a year, making rather more by his skill as a cattle trader than as a cultivator. This is a shore farm of very good soil, with unrivalled facilities for gathering sea manures. Its products could readily be brought up to \$20,000 a year, paying a profit of four or five thousand to the owner. Close by these farms a man owns 42 acres of land which he values at \$250, or over \$200 an acre. It is naturally no better land but much better managed. A single item is 1000 bushels of potatoes from five acres of land. We want more skill and capital concentrated upon the land.

Selection of Seed Corn.

—This should be attended to at the husking, if it has not already been done. Select the cars from stalks bearing two or more perfect ears, and if the corn is not already well cured, tie the cars in strings of a dozen or more, by brailing the husks, and hang them in a room with a fire to dry. The quicker they are cured the better. If they are not damaged by the heat. In the Northwestern States, where the corn is liable to be damaged by the frosts, the best farmers select seed ears before the kernels are glazed, and, after partial stripping off the husks, kill-dry them at a temperature not above 150°. Corn thus treated is said to germinate much quicker, and to mature several days earlier, than that cured in the field. Much seed fails from want of this reasonable attention, and the fields have to be replanted. A few hours of labor now may save weeks in the spring.

Improvement of Sandy Land with Clay Subsoil.

—“R. H. S.,” of Dunbar Station, Pa., says he has a hundred acres of this kind of land, overlaid with blackberry bushes. “Can you tell a sure method to get rid of them? How many bushels of lime ought I to put on to an acre? Would it be good economy to plow under clover, sow wheat, seed it down with clover, and the next season plow it under and sow wheat again? Would the land improve, following up this rotation for years, or would it grow poor? What condition ought clover to be in when plowed under, green or dry?” The persistent mowing of briars the last week in August and feeding the ground close with sheep will gradually reduce and exterminate them. A more rapid remedy is plowing and the thorough cultivation of hoed crops. Wheat once in five years is often enough unless you apply animal manures. From thirty to fifty bushels of lime to the acre is enough to last in the soil for five years. The best usage now is to plow in clover after it has been partially fed. We would recommend the common Penn-sylvania rotation, often referred to in back numbers. See vol. 26, page 283. If a summer fallow is adopted, improve it by harrowing the land every two weeks, after it is plowed in the spring.

Pigeon Berry.

—(Phytolacca decandra). “W. S.,” Stoughton, Pa., says he has a piece of new land covered with young plants of this weed. “I am plowing it again before I seed it, but I cannot get all the plants plowed out, as the ground is very rough and rooty. Will the weeds interfere with the wheat?” If it were practicable we should advise the drilling of the wheat 15 inches apart, which would admit of cultivation. The wheat will probably smother a good many of the small plants, and it will pay to go over the piece in the spring, and with a hoe cut off the crowns of the large ones, if any are left. It is not a difficult weed to eradicate with hoed crops, or with a summer fallow.

Farming by Proxy.

—“W. S. R.,” Manorville, L. I., asks if he can run a store, and at the same time oversee the working of 17 acres of land, and make it pay. That depends altogether upon his business capacities. If the land is near his home, so that he can plan the work on the land and have an eye to it at morning and evening, and he can secure a faithful laborer, he might safely try it. He is near good markets and probably has good facilities for making manure—two items in his favor. But at least thirty dollars’ worth of manure upon every acre in hoed crops.

Heaven and Sorghum.

—“N. S. C.,” Flanders, N. J. “Can any one tell whether the leaves of sorghum cane, when green, partially or wholly dried, have been known to be injurious to cattle when they have been eaten? One of my neighbors in stripping his cane allowed the leaves to become partially dried, and fed some of them to a cow; the next morning he found his cow lying by the pile of leaves dead.”—If the leaves had anything

to do with the death it was probably a case of hoven. This is likely to be caused by any kind of succulent food fed in large quantity to an animal not accustomed to its use. Sorghum is as wholesome food for cattle as corn.

Breed from the Best.

—It was stated in the recent address before the Vermont State Agricultural Society, that the State was losing its reputation for fine horses on account of the constant sale of its best animals,—a ruinous practice with any kind of stock.

Cooked Food for Hogs.

—“Have any experiments ever been conducted to show that it pays to cook the feed of swine? Mine do very well without it, and I do not wish to waste any labor or fuel.”—“C. N. T.,” Theford. “The best farmers all through the East cook the greater part of their feed, after the swine are put up in the fall, and we think this practice is gaining ground in the West, as corn increases in price. Samuel H. Clay, of Kentucky, conducted a series of experiments in feeding corn to hogs, with the following results. One bushel of dry corn made 5 lbs. 10 oz. of live pork; one bushel of boiled corn made 14 lbs. 7 oz.; one bushel of ground corn boiled made 16 lbs. 7 oz. There are other experiments upon record showing quite as great a difference in favor of cooking. If we save more than half the corn, we may as well invest in a cooking apparatus at once. We shall save labor, or its equivalent, money, by doing it.

The Secret of Cheap Pork.

—“H. G.,” Auburn, N. Y. “What is the secret of making pork economically? Mine always costs me more than I can buy it for.” There are several of these secrets known to the initiated. *First.* A good breed. You may sniff any of the land pikes with any quantity of corn, and he will not fatten. *Second.* Chester Whites, or grades of any pure breed, will show their keeping. *Third.* Good housing. A pig wants a nice, clean, dry pen to sleep in. The yard may have much and plenty of litter for manure making, but the pen, or sleeping apartment, should be warm and well strawed. *Fourth.* Early fattening. Pork is made much more economically in warm weather than in cold. *Fifth.* A variety of food. If cooked Indian meal is the staple, let it be varied with green food while it lasts, corn stalks, weeds, parsnips, and clover, and in winter feed enough cabbage and roots to keep the hogs in good condition. *Sixth.* Regular feeding, three times a day. A fattening pig should never squeal, and he will not if he always finds his food ready at the regular time. Calculate to have your pork worth no more and perhaps a little less than the feed costs, and look for all your profits in the grand heap of rich manure which the dying porker leaves as a legacy. These secrets make cheap pork in our pen, even at the present price of corn.

Slaughter House Manure.

—“B. B. S.,” Newark, N. J. “My farm is situated near a slaughter house, and I can purchase the manure. Is it worth any more than common stable manure?”—“If pigs are fed upon the offal, and the calves and sheep’s heads and legs are thrown into the yard, as is frequently the case, the manure is worth twice as much, at least, as common stable manure. The bones and blood, and refuse flesh, hair, and wool, are all powerful fertilizers, and the manure of swine fed upon animal food is much richer than that of the common sty. If you compost the slaughter house manure, use six times its bulk of peat or manure.

Pond Mud.

—“Is there any way to prevent mud from settling in mill ponds?”—“J. C.,” Fall River, Mass. None that we are aware of, and if we owned land in the vicinity we should not desire it. The best part of the soil is carried off in the current, mingled with leaves and other vegetable matter. It is the same material that is deposited upon meadows subject to overflow, keeping up their fertility. It is a good article for the barn-yards, compost heaps, or to spread broadcast as a top-dressing upon mowing lands. If there is much clay in it, spread it upon sandy and gravelly lands; if much sand, spread it upon the heavy soils. The more organic matter the better.

Self-Filling Ice-House.

—“S. E.,” Alexanderville, O., writes: “It is stated that ice-houses are constructed and frozen full of ice by means of introducing water from a spring at a point of sufficient elevation. Is the plan a practicable one?” There is no difficulty in freezing a solid mass of ice in an ice-house in the winter, either when the water is thrown from a jet, or otherwise. We have seen no experiment, but presume it will keep quite as well or better than when packed in the ordinary way. The difficulty is in removing the ice as it is wanted in the summer. The ice packed in cakes is easily cut of any desired size. The other would have to be chipped with an axe, which would consume as much time as the ordinary way of storing. Ice on the large scale is stored for about twenty cents per ton.

Our Jersey Bulls at the Westchester Co. Fair.—We were not a little gratified by receiving, a few weeks since, from Mr. Swain, the first prize cards and ribbons won at the Westchester Co. Fair, by two of the young bulls he had selected from his herd and offer as prizes. We were prevented personally attending this exhibition, but learn that, it proved the efficiency of its new management in a gratifying degree.

How to Take Care of a Goat.

"Mrs. U. W. W." asks how to take care of a goat: if they will thrive on hay and corn; what they will eat; how long they go with kid, etc. An associate who lives in the city recommends to feed them on tennepny nails, old posters, and hard-core cinders, as the goats kept about his residence seem to thrive on that fare. Soberly—goats need air and exercise more than almost any other animal. They cannot well be kept stabled. Good hay, with the scraps from the table (swill), would be sumptuous fare. They are a knowing animal, and will seldom tangle up a tether if fastened out to graze by one. They will gnaw and destroy any cultivated tree or shrub we know of, eat up collars and shirt bosoms, straw hats, books, etc., etc. The goat goes with kid about 150 days.

What Spring Crop on Fall Plowed Sod?

"J. D. W. L.," of Hardin, Tex., Mo., Iowa, Ill., or O., (which State we know not,) asks: "What would be the most profitable crop to be raised on tame sod, plowed late in the fall and well pulverized? Would wheat do well?" You have your choice among: grains between Spring Wheat, Oats, and Barley. If the first does well in your section, and the soil is in good order, sow that, and get it in early, even before the frost is out of the ground. Besides, you may raise potatoes, planted early; at the South, castor beans, first giving the land thorough harrowing and mellowing; flax for seed, if the land is rich and free from weeds, plowing deep this fall, cross plowing and harrowing, or "cultivating" (that is, cultivating) very thoroughly in the spring; and other crops might be named, if we knew the size of the field, soil, and location.

A Guide to the Study of Insects.

The appearance of the first part of Dr. Packard's work was announced some time ago. The third part has just come to hand, and is full of interesting matter about bees, wasps, and related insects, well illustrated. The parts sent by mail from this office at 50 cents each.

Ichneumon Flies and Grasshoppers.

"E. S.," Highland, Kansas, says: "The grasshoppers have found their match in these flies. They are found in great numbers in a dead or dying state, with worms or maggots in them $\frac{1}{4}$ to $\frac{1}{2}$ inch long, with small black or brown heads. Scarcely a fly of white head has been seen in parts of the State on account of the grasshoppers. This country is improving at an astonishing rate."

"Freezing Kills the Eggs."

Greeley is reported as saying, with respect to the destruction of insects: "Fall plowing is also a good remedy if the land is left in ridges. Freezing kills the eggs." To this we say in the words of the Scotch verdict, "not proven." All the testimony points to the indestructibility of the eggs of insects by any amount of natural cold. The eggs of the tent caterpillar, katydid, and all those insects which deposit them above ground, pass our severest winters without injury, and until it is shown by positive experiment that the eggs deposited in the earth are of a different nature, we shall decline to believe that "freezing kills the eggs." If the belief that it does will induce people to plow land in the fall and leave it in ridges, it will not be productive of injury, but of good.

The Cincinnati Horticultural Society's Exhibition.

It was held in the spacious skating rink, which was made so summer-like that one would not suspect that it was a building mainly devoted to winter pleasures. A mile's length of evergreen wreath quite hid the truss work of the roof, and a large fountain, surrounded by rock-work and grotesque plants, occupied the center of the floor. The most noticeable feature was the way in which pot plants were exhibited. Instead of being placed upon tables and stands they were tastefully grouped upon the floor, and so surrounded by turf that the effect of the whole was that of a brilliant and well-kept garden. For beauty of arrangement this far exceeded any exhibition we have seen, and the result was largely due to the taste and hard work of Messrs. Haerlin and Pentland, and the abundant contributions of J. B. Bennett, Mr. Longworth, Captain Anderson, and others whose names have escaped us. J. S. Cook had a forest of choice green-house plants, remarkably healthy and well grown, and deservedly took the first premium. The collections of evergreens in pots by F. Pentland and S. S. Jackson & Co. were very fine

and interesting. The display of fruits, especially of grapes, was large, but that of vegetables not up to what we expected. Of course we cannot give a detailed report of this splendid exhibition. Much of its success was due to its President, Capt. W. P. Anderson, who worked only as one who has his heart in the cause, and R. A. Varder, who is just a second edition of "American Pomology," and seemed to possess the happy faculty of being everywhere at once. Under its present administration the Society will maintain the claim of Cincinnati to be one of the important centers of Horticulture. We cannot close this brief notice of the show without alluding to our pleasure in meeting such veterans in the cause as Robert Buchanan, Graham, Mottier, McAvoy and others, whose love for fruits and flowers seems to strengthen with their years.

The Ohio State Fair was held at Toledo, Sept. 21st to 25th, under the auspices of the Ohio State Board of Agriculture. Though a cold storm interfered with the attendance, it was a grand success. For excellence of arrangement, abundance of contributions, courtesy of officials, and the generally intelligent appearance of the crowd, it excelled any State Fair we have ever attended. The show of stock of all kinds was large, but the rain prevented a full examination. In the department of implements the variety was bewildering. It has been said to be the best exhibition of implements ever made. The mechanical or machinery department was also very full. Indeed, the show was so immense that the single day to which the rain confined us was hardly enough to allow one to take more than a general survey. The halls devoted to specialties were spacious, well arranged, and well filled. The show of fruit was something to gladden one's eyes. We cannot particularize, except to say that the much-neglected quince was here in deserved prominence, that the display of grapes was immense, and that our friend, M. B. Bateman, of Painesville, deservedly took the leading premiums. Floral Hall was full of beautiful things, among which the fine collection of Lenk & Co., Toledo, was conspicuous. The Vegetable Department, facetiously styled "Pumpkin Hall" by its indefatigable superintendent, D. C. Richmond, of Sandusky, was full of excellent products. It was a treat to see that vegetables for once have a good chance as pears and grapes. Among the points of attraction were the temporary offices of the Ohio Farmer and the Toledo Blade, and it were difficult to say from the number of visitors at each, who was the more popular. Col. Harris of the Farmer or Mr. Locke of the Blade, the latter being the well-known Petroleum V. Nashy, Postmaster.

Scabby Leg in Fowls.

"G. P.," Amite, La., writes: "My fowls have been troubled in this way. We call it Gout. My remedy is turpentine, applied, say twice a week, with a small brush or swab. Whoever makes the application must be careful not to let the turpentine run down along the toes, as it is apt to make them bleed. Three weeks will be about the time required for the entire disappearance of the scab."

Underdraining Water Meadows.

—An English farmer broke up thirty acres of water meadow which produced nothing except coarse sedges, grasses and rushes. After it was thoroughly drained and laid down to grass, he was able to cut four crops of green fodder annually of the very best quality. The same thing could be done in thousands of instances in this country.

Bumble Footed Fowls.

—When heavy fowls roost high, as they always fly down, they are very apt to drive gravel stones into the soles of their feet, and to bruise them otherwise so as to cause swelling and soreness. Sometimes, also, corns appear on the soles. These troubles are much more frequent among roosters than hens because they are so much heavier. "J. C. K." describes a trouble, which is probably a corn due to the sun-burn, or possibly hereditary. Corns may sometimes be cured carefully, or looked about the sides and pulled out. Stuff plenty of lint into the cavity and bind a piece of rag on; it will heal soon if the bird is well.

The American Stud-Book.

—Lovers of the horse, and especially all in this country interested in the thoroughbred horse, should welcome with as the first volume (A to L) of the American Stud Book, prepared by Col. S. D. Bruce, of New York. This contains the pedigrees of "all the imported thoroughbred stallions and mares, with their produce, including Arabs, Barbs, and Spanish horses, from the earliest accounts to the end of the year 1867; also all the native mares and their produce." The great value and importance of correct pedigrees of breeding animals are now universally conceded. Those peculiar excellencies or defects which have become, with hardly an exception the inheritance of sire, dam, and foal, for generations following generations, mark a distinct breed and fit it for the uses to which it is ap-

plied. The question "What makes a thoroughbred?" as applied to horses, has been often discussed. If all the blood flowing in a horse's veins can be proved to flow through trained English horses from "Araby the blest," Turkey, Barbary, or Andalusia,—the horses of which countries all have a common origin—all agree that the animal is thoroughbred. If, however, the fact cannot be proved, would it be any less a fact? Then a horse may be a thoroughbred and universally acknowledged as such, and yet the proof be wanting. This, as we understand it, has induced many horse men to record horses as thoroughbreds which had pure crosses for only five generations. It is well known that some of our most famous horses have had imperfect pedigrees, yet no one doubted their thorough breeding. Such, though not showing the requisite *five crosses*, have been included in this volume. It is a handsome octavo, printed on tinted paper, with clear type, and embellished with 30 or more copper plate engravings. Published by E. B. Meyers & Co., Chicago.

Coloring Carpet Warp.

—N. S. Thomas, Painted Post, N. Y., sends the following direction for coloring carpet yarn. "Extract of Hemlock bark is the substance wanted. Wet the warp thoroughly with lime water; then boil in a strong liquor made by dissolving extract of hemlock bark in water. Use a brass, copper, or porcelain kettle (not iron or tin); this gives a tan color. For a black color use strong copperas water in place of lime water. Iron or tin vessels will answer when copperas is used. A slate color can be made by using a small quantity of the copperas water and extract liquor to a large quantity of the warp. A brown color can be made by using only a small portion of copperas with the extract. The shades of color can be changed by varying the amount and proportion of the coloring materials. A little care will enable any one to make desirable colors with these materials, and to modify the colors by using other substances with them. The extract of Hemlock bark is very extensively used by tanners for making leather, and is made at large establishments for the purpose located in or near the hemlock forests.

The Gamgee Meat Preserving Process.

—Professor Gamgee has been spending the summer at the West, preparing to put up beef, mutton and other meats for Eastern and European markets. He recently returned with a fine lot of beef, mutton, prairie chickens, etc., which was exhibited for a week or more before being packed and sent to England. The beef was in quarters, the mutton in carcasses. We partook of some of the steaks and found them most delicious and are confirmed to our good opinions heretofore expressed, and in our best wishes for the success of the process, in the hands of the Gamgee Meat Preserving Company.

Bleaching Wool on Tanned Pelts.

—"J. N.," of Trenton, a manufacturer, sends the following directions: "Put an old pot or other iron vessel in the bottom of a hogshed, and in the vessel a roll of brimstone. Fasten near the top a stick or two, to place the skin on. The wool must be wet, when hung on the sticks. Heat an old iron red hot, or take live coals to start the brimstone. When it is burning briskly cover the hogshed tight to keep the smoke in. In bleaching blankets we put them in after dinner and take them out next morning. If not white enough, repeat the process."

Cork Oaks in California.

—Mr. J. H. Lick, Lick's Mills, St. Clara Co., Cal., planted acorns of the cork oak in 1858, and now has 85 trees, from 15 to 20 feet high and from 8 to 10 inches in diameter. This would indicate that the climate of California is very favorable to the growth of this valuable tree.

Irrigation in Winter.

—"E. H. T.," Stroudsburg, Pa., "I have a brook, quite small in the summer but running full in the winter. Will it be of any service to turn it on to a meadow with a rather light sandy soil this winter?" The popular idea that irrigation is good only for growing plants is erroneous. Water has a very important action upon any soil where there is good drainage, and makes the inert matter available for plant food. In the most successful case of irrigation that has come under our notice the water is kept running through the winter. The freezing in severe weather makes a complete covering of ice, which acts as mulch. The grass starts early in the spring, and the crop is kept up to two tons to the acre without any other fertilizer than water. There is a mine of wealth in every brook that can be turned upon a dry soil, if the farmer will work it.

More Glass.

—Mr. Peter Henderson, not content with 17 green-houses, each 100 feet in length, has erected another house 300 feet long and 20 feet wide. If Mr. H.'s flower business should continue to increase as rapidly as it has done for a few years past, he will soon have a good part of South Bergen under glass.

Fish Ponds.—"S. E." Alexanderville, Ohio. Trout will flourish in ponds supplied with spring water, and lime stone soil will not injure the water for their use. There are persons who make a business of selling fertilized eggs, and young fish, especially trout, which are most in demand. They would do well to advertise their stock. The eggs of trout are hatched during the winter, and the young fry are usually forwarded in the spring. They should be kept in a pond by themselves for at least a year, to prevent their destruction by other fish. Persons who make a business of raising trout for the market usually allow no other fish in the ponds, and turn in trout of the same age, so that they may not devoured another. This is the better course, for they are as easily raised as other fish, and always bear a much higher price. Yellow perch, black bass, and pickered, are all good fish for ponds, and live together in the most amiable way, preying alike upon their own, and their neighbors' young. T. Norris has just published a work on American Fish Culture, which contains the latest information upon the subject. For sale by Orange Judd & Co. Price \$1.75.

English Sparrows.—"H. G." Providence, R. I. "Are the English sparrows a good investment for cities?" Judging from their history in New York they are. They are wonderfully prolific, and clear out most of the smaller kinds of insects. Four pairs of these birds came to Union Square in the spring of 1866 and built their nests. The measuring worms soon disappeared from the trees, so that it was a pleasure to walk under them. In one season they had become a flock of 70, and they are now said to number over 600, besides the multitudes that have gone to the country. They are found now 40 miles from the city. They will eat the farmer's grain, but do they not earn it in the multitude of insects they destroy? A city whose parks are infested with worms cannot do a better thing than to introduce these birds. If provided with houses, and fed and watered, they will abide through the winter, and make the streets cheerful with their incessant twitter and chatter.

Breachy Cows.—"F. C." Hampton, N. J. "I have two cows that I find it difficult to confine in any pasture. Pokes and other contrivances do not prevent them from throwing down fences and leading the whole herd into mischief. Is there any remedy?" If they are good milkers it will pay to sell them or to tether them; if they are not, probably the best remedy is the beef barrel. We have never known this to fail in the most obstinate cases.

Fattening Cattle in Winter.—"L. D. H." Sutton, Mass. "Will it pay to stall feed cattle for market at the present prices of grain?" We think not in the Eastern States. Most of the beef that supplies our markets is made from grass in regions remote from market. Your grain will pay better fed to other animals, or sold, if you will buy manure with the money.

Garget and Bloody Milk.—"The use of Tincture of Arnica in cases of garget, caked bag, and bloody milk, has repeatedly been stated in the *Agriculturist*. These ailments are very prevalent, especially at calving time, and many an excellent cow dies of milk fever, or loses one quarter of her bag for lack of timely attention and a little of this drug. It is in accordance with our principles to give "line upon line," and so we publish a note received from J. E. Morrill, of Hampshire Co., Mass., who thus writes: "I keep a drug store in this town. A gentleman who has purchased a great deal of Tincture of Arnica of me said a day or two since, 'Do you know that Tincture of Arnica is the best thing in the world for garget in cows? I keep twenty-two, and by giving them a teaspoonful of the Tincture in bran, three times a day, and bathing the bag thoroughly with it as often, they are always cured in a very short time.'"

Treatment of Calves.—"A. N. R." Gaines, N. Y. "What is the best winter treatment for calves, to make good milkers?" A plenty of good feed and shelter. The practice of keeping them at the stock yard on the poorest fare to fatten them is unprofitable. Put them up early, feed and water regularly, and if the hay be of poor quality, supply the deficiency by corn meal, oil-cake, or roots. They should be kept constantly groomed, to bring out all their good qualities. The extra care will be certain to show itself in the pail in due time.

Sending Poultry to Market.—"Immense quantities of poultry are sent to market this month and ignorance of the proper way to do it, and sometimes a desire to overreach, causes many serious losses. First, let the birds fast 12 hours. Foolish people often let them eat their food of corn just before killing them, with the idea that they will weigh more. A fasted bird will keep

a week fresh and plump if well handled, while one that has been fed within a few hours will be sore to spoil, or become more or less tainted. One tainted bird in a case will cut the price on the whole down several cents per pound. So will one that is scrawny and looks bline and skinny, and as if it had been sick. Second, kill without dislocating the neck or making a hole in the skin. The operation is simple. When the fowls are caught, with a lad to hold, tie the legs of all, and lay them down. When ready, hang them by the legs, a few at a time, on long pins or nails; then with a sharp knife passed into the throat, cut once or twice across, letting the knife bear on each side against the back bone. This will sever the great veins of the neck, and the bird will bleed without wetting its feathers at all. Third, pick without scalding, and while the fowls are still warm. Take great care not to tear or bruise the flesh in spots by too hard fingering to get all the pin feathers out. These may be removed with a pair of pliers, if great pains is taken. Draw out the tail and wing feathers first and those of the back last. Fourth, hang all in a cool, airy place over night, and pack in clean, strong cases of a size easily handled by one man, putting 150 to 200 pounds in one case. Take the cords from the legs and lay the birds in uniform rows, heads towards the sides of the box and break up. A very little clean wheat straw may separate the layers, but it is best to use nothing. Fill the boxes so full that it will require a little pressure to force the covers down. Address to a trustworthy agent or commission dealer. It would pay any one who markets much poultry to have a modest stencil plate made to mark his boxes, and to read thus: "Poultry from A. B., well fattened, fasted 12 hours, and not scalded."

Cooking Pumpkins for Cattle.—"L. K. T." Ashfield, Mass. The utility of this practice depends somewhat upon the feed used in connection with them. Fed raw they are a valuable addition to grass or hay, and greatly increase the flow of milk. If the cows were confined to the stable and there were conveniences for steaming we should prefer to steam the pumpkins with the cut feed and meal. Steaming dry food, as hay and the grains, pays much better than steaming vegetables.

Infringing Patents.—"L. H." A man has no right to make a patented article upon his own premises, for his own use. The patentee gets his right from the government, to prevent this very thing. When his patent expires the public will have the full benefit of his invention. This probably is the best course for the public, as well as the patentee; for useful inventions are much more generally advertised and introduced through the enterprise of the discoverers, stimulated by the hope of gain, than they could be by any other method. The exclusive right enables them to command capital, which would otherwise be withheld.

Blooded Stock Among Small Farmers.—"How can they be introduced where no one has capital enough to purchase suitable breeding animals?"—"A. K." Fern, Mass. The thing can be accomplished by a joint stock company or a neighborhood effort without the formality of any organization. A half dozen farmers owning altogether fifty cows might unite in purchasing an Ayrshire or Jersey bull, and thus secure nearly all the benefits of individual ownership. If a good bull were thus secured in a neighborhood, and the superiority of his stock once established, cows of the same breed would soon be introduced, and the dairy stock be greatly improved. Fine stock, purely bred, of horses, cattle, sheep, and pigs, is now so greatly multiplied that it is within reach of every district, if farmers will unite to secure it.

Rotary Spader.—"J. K." Wyoming, Kansas, inquires for Cnutstock's Rotary Spader. We believe no satisfactory spader for horse or steam power has yet been brought before the public. Or if this be so the inventors have a very poor faculty of making the public see it. Something of the kind is very much needed, but for the present we shall have to put up with the Michigan plow, as the best implement to make a good seed bed.

Fall Plowing.—"There are several advantages in plowing at this season. The soil, if left in a rough, loose state, is thoroughly exposed to the weather for several months. In the repeated freezing and thawing, it undergoes chemical changes, and a larger supply of food is made available for the crops. Then if manure is spread broadcast and plowed under it is more evenly distributed, and incorporated with the soil, and the next crop receives more benefit from it. If plowing be deep, a multitude of grubs are brought to the surface and destroyed. The seeds of weeds also germinate when the plowing is early enough, and thus another enemy of the crops

is damaged by the frost. The teams are now usually in the best condition. They have had full feed in the summer pastures, and are strong for labor. In the cold, wet springs in which we are liable, it is of great advantage to have as much of the plowing done in the fall as possible. Then no time is lost in waiting for the weather, and the seed can be put in, in due season. Care must be taken not to expose land liable to wash to currents of water, as serious damage is often done to stubble land in this way. Clay soils are most benefited by fall plowing. Stubble land, to be as much exposed as possible to the changes of heat and cold, is often thrown up in ridges of two furrows turned together. These are split in the spring and harrowed, to prepare for grain or potatoes.

Small vs. Large Potatoes for Seed.—"I. G." Thomaston, Me. "Has it been decided which is the better practice?" Perhaps not fully, but many good cultivators have decided and practice accordingly, some with large potatoes, and some with small. We have tried both, and think the result depends much more upon the quality of the soil and the cultivation than upon the size of the seed. We generally plant potatoes about one inch in diameter, on good soil, and give thorough cultivation. The yield is satisfactory. Dr. Hexamer's experiments show an excess of large potatoes from large seed. See volume 25, (March, 1866), page 98.

Burdock Patches.—"N. T." Riverhead, L. I. "I have several plots of burdocks that grow with more uniformity than any garden crop. I have fought them ten years and 'they still live.' Is there any remedy?"—Your patches are probably well stocked with seeds, and it will take several years to eradicate them. Cut off the plants just below the surface of the ground with a sharp hoe in the fall, and burn the tops, and you will destroy the present season's growth of burrs. If you follow this a few years and you will conquer. If the patches are enclosed, and can be cultivated, they can be destroyed much sooner.

Value of Immigration.—"We have an average of over 200,000 people coming to us from Europe every year. The statistics show that they bring with them an average of \$20 per head, and they are estimated to add \$1000 each to the producing power of the country. This is an addition of over 200 millions of dollars to our capital. Most of them are in the prime of life, and they proceed at once to the cheap lands of the West, where they carve out homes in the forest and upon the prairie.

The Canada Fair and the Fair of the N. Y. State Agt Society.—A visit to the Provincial Fair at Hamilton, and the week after, to the N. Y. State Fair at Rochester, suggests this comparison. The first thing that strikes a visitor from the State is a certain English cast in the implements. The plows are frequently made of iron, have almost invariably long handles, the point long with a narrow wing, a very convex moldboard set so narrow that while it is about twice as long as many American plows, it does not turn nearly as wide a furrow. Next we notice a dozen or so different patterns of double moldboard plows for making ridges for turnips, all modeled after those used in England. The harrows are frequently made of iron, and sets of four harrows that would take a wide sweep are not uncommon. The cultivators have narrower and longer teeth, and strike the ground less abruptly than those in the States. Sometimes, too, they have two sets of teeth, that can be changed, one flat and wide for cutting up weeds, and the other narrow for merely stirring the ground to a considerable depth. Turnip drills with rollers for sowing the seed on ridges are another feature.

At Hamilton, as at Rochester, the horses were boxed up in a way admirably adapted to keep visitors from seeing them. We should judge, however, that the tendency in Canada is for powerful, active horses, adapted for the heaviest kind of farm work, while ours run more to style and speed. In cattle the show in Canada was, on the whole, far superior, both in number and quality. For the Prince of Wales Prize, for the best herd of five cows and one bull of any breed, there were six entries—three Short-horns, two Herefords, and one Galloway. They were shown in a large ring, where they could be seen to good advantage by thousands of interested farmers. We have rarely, if ever, seen as fine a lot of cattle together in one ring. At Rochester, leaving out the herds brought from Canada, we had a very slim show. The Short-horn Vanderbilt, of Geneva, James O. Sheldon, did not exhibit, as he has already taken all the honors. Hon. A. B. Conger and Hon. Ezra Cornell showed excellent Short-horns, and the Hon. Mr. Campbell, of New York Mills, as fine a herd of Ayrshires as can be desired. W. B. Dismore, and others, made a good show of Alderneys, and there were some good lots of Devons. But on the whole the display would not compare with that at

Hamilton. The same is true of sheep. We expected to see a grand display of Cotswolds, Leicesters, and South down sheep in Canada, and were not disappointed, but there were actually more "American Merinos" shown at Hamilton than at Rochester. The sheep fever was not as high in Canada as here, and the reaction is not so severe. There was a magnificent display of Long Wools, and also of the different varieties of Downs—Sussex, Hampshire, Oxford, and Shropshire; but the former, there as here, are apparently more popular on account of their larger size and of the demand for combing wool.

In thoroughbred pigs there was a miserable show at Rochester, and a capital one at Hamilton. Our State Society does nothing to encourage the raising or importation of thoroughbred swine, while in Canada much attention is devoted to these useful animals. Any pig imported during the year, if it takes a prize, is awarded a premium of double the ordinary amount. Accordingly there were several pens shown that had been recently imported. At Rochester there was not one. There were one or two pens of Yorkshire and Essex, and it may be of Suffolks. The rest of the swine on exhibition were Cheshires or grades, that should have been shown as such.

In wheat, barley, oats, peas, and vetches, the competition was far greater than with us. The farmers take an interest in the matter, and the bags were constantly surrounded, and their contents examined and discussed. At Rochester there was the best display of grains we have had for years, but the barrels were all headed up, and so far as the public good was concerned, they might as well have been in the barn at home. In corn, beans, and potatoes, the show was superior to that at Hamilton: so it was in fruits and flowers, and perhaps in garden vegetables; but in roots for stock, such as Swedes, carrots, parsnips, and mangel wurzels, we "cannot hold a candle" to the Canadians. At Rochester there was a great display of agricultural implements and machines, and an excellent one also at Hamilton, but in this department we need not fear comparison. We had several excellent ditching machines, that did good work. There was one in operation on the grounds at Hamilton that was not worth a "Yankee shipplaster." We had three good machines for husking corn, a dozen or so of potato diggers, some of much promise, a good steamer for cooking food, scores of good plows, cultivators, etc., churns, butter workers, wringers and washing machines without number, and for visitors as grand a company of intelligent men and women as can be found in any country.

Spring Barley.

The following is from a farmer in Western N. Y. "Spring barley requires richer land than winter wheat. The roots do not extend half as far, and the crop grows so rapidly, especially in this climate, that it is necessary to have a liberal supply of food in the ground. Fifty bushels of barley take no more plant-food from the soil than forty bushels of wheat, but we need more plant-food in the soil because the roots have not time to push out far in search of it, as is the case with winter wheat. For this reason I am inclined to think it will be well to summer-fallow good, strong land for barley, and follow it with wheat. We should in this way get rid of red-root.* Of course we need not break up the land as early as for wheat. Plow, say in August, and harrow well, and then after we are through wheat sowing, plow again a little deeper; and if there is time, and the weather favorable, plow it again the middle of November, and leave it rough for the winter. The barley might be put in early in the spring, simply by harrowing or cultivating. In this way we divide up the work better. Summer-fallow one field for wheat and another for barley. If the whole is summer-fallowed for wheat there is little for the teams to do after the middle of September, when they are better able to stand hard work than during the heat of summer. Autumn is the time to work land."

PAINT IN THE TOOL ROOM.—Paint pots and brushes are among the good investments upon the farm. They are suggestive of carefulness and of thrift. The essential materials in a good paint are Linseed oil and white lead. Coloring

matter is cheap, and not much of it is needed to give any desired shade. Not much skill is required in the mixing, and any farmer can soon learn to paint his own buildings, tools, vehicles, and fences. Tools last much longer if their woodwork is kept well painted or oiled. Linseed oil, well boiled, without the lead, makes an excellent protection for axe helves, and the handles of all tools that are much exposed to the weather. The painting and oiling of tools is good wet weather work, and there are always leisure days after the harvests are gathered, when the fences and farm buildings can be cleaned up and painted. Cheap paints are usually poor investments, except as they may be useful for specific purposes.

Steamer or Mill?

Cooking grain for cattle and swine is certainly the best substitute for grinding it, and the steam apparatus has a much wider application than the farm mill. So that for a farmer engaged in common mixed husbandry, there can be no question which he had better buy, a farm mill or a steam apparatus. With a steam boiler, in which steam may be economically raised, all kinds of grain, roots, root-tops, cabbages, hay, in fact any kind of hog or cattle feed, may be profitably cooked, even if fuel is not cheap. The question of the profit of having his corn ground if a farmer has a good steamer or boiler, we cannot now answer, but from what facts we now have, we are induced to think cooking preferable. We know very well that ground corn will go a great deal farther in fattening pork or beef than whole corn, and that cooked meal will go further still. We know also that cooked whole corn is of a much higher feeding value than raw, that it is more easily digestible, and more palatable. Who can give us the figures by which we can compare the feeding qualities of simply cooked and simply ground corn?

How and When to Milk.

As a general rule, farm men dislike to milk, and consequently seldom do it well. In the dairy districts, where milking is one of the most important labors on the farm, it is not difficult to get good milkers, but in the grain districts it is easier to get ten men who are good teamsters than one who can milk rapidly and clean.

It is not so important to milk rapidly as it is to keep up a steady flow. To milk fast one day and slow the next is injurious. If the milker becomes tired, it is better to rest when he has finished one cow and before beginning another, than to rest or lag during the operation. An irregular milker will soon spoil a cow. She will not give down her milk steadily. On the other hand, a cow that is milked steadily will give down her milk freely and with a steady flow. Such a cow can be milked in five minutes. We have a cow that gives about 10 quarts at a milking, that we have milked in 4½ minutes. After letting a poor hand milk her a few weeks we could not milk her clean under seven minutes. We have little doubt that a poor milker, although he strip the cow clean, will cause her to give less milk. This is the general opinion of dairymen, and is doubtless correct. It is certain, if a cow is not milked clean she will gradually fail in her milk. And it is equally certain that the last drawn milk is much richer than the first drawn. Experiments show that the strippings contain four or five times as much

cream as the rest of the milk. As a check on careless milkers, it is best to have a member of the family or some trustworthy person go over all the cows after the milking is finished, and strip every drop of milk from the udders. With an empty pail this is little trouble. Some object to the practice on the ground that "the cow should be milked clean at once." This is true, but it will be found that when the practice of stripping is regularly adopted, the cows will be milked much cleaner than where a perverse or careless milker knows he is in little danger of being detected. We have known a good and usually reliable man to leave four quarts of milk in the udder! In milking it will be found that "even the best of men are none the worse for a little watching."

It is not easy to describe the operation of milking. It can be learned only from example and practice. Our own method is to have a three-legged stool, as being firmer than the one-legged kind sometimes used, and to hold the pail up from the ground firmly between the knees. We do not like to see a man stick his head against the side of the cow. There is no advantage in the practice, and the position is not as good for the free action of the muscles of the arms and hands as to sit upright. Grasp the teats firmly, with all the fingers, if possible, and close the upper finger a shade earlier than the lower ones, in order to keep the milk from being forced back into the udder. The principal work will be done by the three lower fingers. Some good milkers pull down on the teats, but this is unnecessary. A steady contraction of the fingers is all that is required; the pressure forces out the milk, and when they are opened, the elasticity of the teat forms a vacuum, and a fresh supply rushes in, which is forced out as before. This is all there is to milking. It is one of the simplest and pleasantest of operations, and we can but think that the reason so many farm men object to it is based on prejudice and perversity.

Where but few cows are kept it is seldom convenient to milk at the same hour at night as in the morning. As a general rule, cows are milked before breakfast, say from half past four to half past five; and at night from half past six to half past seven. At night, therefore, we get the milk from 14 hours, and in the morning from only 10 hours. Prof. S. W. Johnson, in his "Notes on Recent Progress in Agricultural Science" in the Am. Agricultural Annual for 1868, gives the results of some experiments, which show that the milk after an interval of

10 hours contained4.36	per cent fat.
11 "4.31	" "
12 "3.97	" "
13 "3.97	" "
14 "3.51	" "

When the above system is adopted, therefore, the night's milk would, other things being equal, be about 20 per cent poorer in butter than the morning's milk. Dr. Voelcker, in his admirable article on Milk, in the Journal of the Royal Agricultural Society, says: "The popular opinion ascribes to morning's milk better quality than that obtained in the evening. My results do not favor this all but generally received opinion. As far as my experience goes, the result depends on the quality and quantity of the food which is given to the cows four or five hours before milking. If the supply of food given in the day-time be good and plentiful, and that furnished in the evening be unwholesome and scanty, the evening's milk is of the better quality. On the other hand, when the cows get a good supply of rich food in the evening, and are stunted or fed upon very watery food during the day-time, the evening

milk is the poorer. * * * Out of 32 samples taken in the morning and the evening of the same day, I found in 8 cases the morning milk poorer than that of the evening; in 4 cases, richer; whilst in 4 there was no perceptible difference."

The fact is not mentioned, but the probabilities are that the cows were milked at the same hour morning and evening. Where, as in this country, they are milked later at night than in the morning, the "popular opinion" that the morning's milk is richer is correct, as shown by the above experiments quoted by Prof. Johnson.

The composition of morning and evening milk, says Prof. J., "exhibits a constant, though slight difference, which, in general, consists simply in containing *half a per cent* more fat at night than in the morning. In the morning milk this fat is replaced by almost precisely the same quantity of water." These cows were milked at 6½ to 7½ A. M., and 5½ to 6½ P. M.

In other words, an hour later in the morning than at night, and consequently the night's milk was the richer in butter. That the milk contains a less percentage of butter when the milking is delayed an hour or two seems to be proved.

In the dairy districts, there is no difficulty in milking at the same hour night and morning. It is a regular and important part of the daily work; but where only a few cows are kept it is not so easy. During harvest, for instance, we have known cows not milked until 8 o'clock in the evening. That this is an injury to the cow and a loss to the farmer cannot be doubted. Our own practice is to attend to the horses and feed the pigs, etc., before breakfast, and milk immediately after breakfast—say 6 o'clock; and at night to milk as soon as the teams can be put in the stable and fed—say 6½. This makes only half an hour's difference.

It is also essential to treat the cows with the greatest gentleness. Never suffer a harsh word to be used or permit loud talking. To kick a cow should be an indictable offence. A cow is susceptible to kindness, and will surely repay it. Women make the best milkers, and a cow will give more milk when habitually milked by a woman than by a man. If our barn-yards were kept as clean as they should be, we should see more farmers' wives and daughters drawing rapidly and gently the rich milk from our generous cows. Where dairying is not the special branch of farming, let the good wife have all the butter money, and do not borrow from her and forget to pay.

The Value of Grade Cattle.

The author of "Walks and Talks" writes: "Our Agricultural Societies make a mistake in not offering more liberal prizes for grade animals. It is all very well to offer prizes for the best Short-horns or Devons, but farmers have comparatively little interest in the matter. The raising of thoroughbred stock will be, and must be, confined to professional breeders. Farmers who keep cattle simply for meat or milk do not want a herd of pedigree animals. 'If you raise Short-horns,' said the herdsman of one of our well-known breeders, 'you must raise them as Short-horns.' In other words, give the calf the milk of at least one cow all summer, with what oil cake, grass, etc., it will eat in addition. Now this is all very well and perfectly proper. It is the only way in which to develop that tendency to lay on flesh, for which the breed is celebrated. Keep up the system from generation to generation, and the tendency to consume large quantities of food and convert it into large

quantities of beef becomes established, and this desirable quality is imparted to the offspring. But we cannot afford to raise stock for ordinary purposes in this way. It is the province of the breeder and not of the farmer. The value of the Short-horn consists in its ability to impart its qualities to common stock—to give us grades that have little offal, and that will convert a large quantity of food into beef or milk. It is the grades that we want, and it is the grades that should be shown. John Johnston once said to me, 'I don't care for pedigree. Let me put my hand on an animal and that is all I ask.' This is true in the sense in which he intended it. His own experience proves, however, all that the most enthusiastic advocates of thoroughbred animals claim. He is a neighbor of Mr. James O. Sheldon, who has Short-horns second to none in the world, and Mr. S. allowed Mr. Johnston to send a favorite cow to one of his best pedigree animals. Mr. J. gave the calf the same treatment he would any other calf, and nothing more. He never starves any animal, and did not starve this one. But it was not stuffed or forced. It had no grain and received only ordinary treatment. Perhaps I should take that back, for, as Mr. Cornell once remarked, 'ordinary treatment' consists in keeping a calf so that it shall lose in the winter half what it gains in the summer. The calf received good, ordinary treatment, and nothing more—such treatment as any farmer can afford to give. Well, when I was there the calf had grown to be a steer, and was 26 months old. A butcher came along and offered Mr. Johnston 10 cents a lb. live weight, and take him at 1,400 lbs., or \$140. He would not sell him, though thinking that he overestimated the weight. Mr. J. wanted me to see him weighed, and I did so the next morning. After fasting all night, he weighed 1,360 lbs. So much for pedigree. Now it is just such animals that I want to see exhibited. I cannot go into raising thoroughbreds; I have not money enough. But I can afford to raise good grades. All that we need is thoroughbred bulls. And it is so with sheep, and with pigs, and I presume with poultry also. Let us see what the use of thoroughbred males will do when crossed on common stock. Let us have a good show of grade animals at our fairs.

"I have some thoroughbred Essex pigs. And I have also some grade Essex. That is to say, pigs from a common sow, crossed with a thoroughbred Essex. The thoroughbreds and the grades have the same treatment, but the grades, of the same age, are decidedly ahead. The grades have all the symmetry, fineness of bone, and tendency to fatten, of the thoroughbreds, and have the vigor and hardness of the sow. To exhibit the thoroughbreds does little good; but an exhibition of grades, fit for the butcher, would show farmers the advantage of using thoroughbred males, even with common sows."

A Settled Policy on the Farm.

The whole secret of the successful farmer often lies in his having a fixed plan of operations. Multitudes have no plan but to meet their immediate necessities and make money by the easiest and seemingly shortest methods. If wool brings high prices, they will gradually give up dairying and work into sheep, with the expectation of making their fortunes. If wool and mutton raising for a time does not pay, they sell their flocks at a great sacrifice. If hops are sixty cents a pound, they invest in hop poles and kilns for drying, and expect sudden

wealth. If, when their yards come into full bearing, the prices fall off one-half or more, they are disgusted, and ready to plow up their yards, concluding the business will not pay. There are men who are always taking up a good thing a little too late to make money by it. The farmer cannot afford this continual change. His business is less speculative than any other, and, after providing for the wants of his family and stock, he should give his attention steadily to the production of a few animals, crops, or other products, on which he can rely to raise money. Any branch of farm industry, steadily followed, will be found profitable. Dairying, in a year of short grass, might not pay very well. But the years of drought are exceptions, and the man who makes first-rate butter or cheese will find them a reliable source of income. Where a specialty is made of some one crop, it is particularly important that he should follow it steadily. The raising of hops or of tobacco requires fixtures that are useless in any other branch of farming, and the change of crops involves a considerable loss of capital. Besides, we are always learning in a business to which we give habitual attention, and this knowledge is as much a part of our capital as the money invested in tools and buildings. If a man should make potatoes his leading crop, he would study to lessen the cost of production, and would resort to devices in the preparation of the seed and the soil, in the use of manures, and in cultivation, quite unknown to the farmer who pursues a careless style of husbandry. He could raise potatoes cheaper than his neighbors, by means of his improved methods, and if he sold at the same price, make more money. Whatever branch of farming you follow, stick to it, if it is moderately profitable. Lay your plans far ahead, and be prepared for the exceptional years, when large profits come from high prices, or losses from unfavorable seasons. A mixed husbandry is always the safest, and is not at all inconsistent with the cultivation of commercial crops, as tobacco, hops, flax, onion seed, or vegetable seed of any kind, garden vegetables for market, fruits, etc. The introduction of these requires close calculation, definite plans, and thorough business management, if success be attained.

Burning Straw at the West.

This practice, which prevails so generally in the new settlements, is exceedingly wasteful. No sight is more common than immense piles of straw left to rot in the fields, or given to the torch, as the quickest method of riddance. The ashes, indeed, are restored to the earth, but not to the soil. The few square rods on which they lie are scarcely benefited. All the organic part of the plant is dissipated and lost by the burning. It will be said, in justification of the practice, that there is no market for the straw, and it is an incumbrance upon the soil, and perhaps, also, that the land is rich enough without it. Every farm should have a good home market for straw. Great use is made of a portion of it for fodder by our best farmers, and the manure from the extra stock thus kept is returned to the soil. It is largely used for bedding, and the cattle yards are kept thickly covered with it. It would pay better to spread it upon the soil where it grows, and plow it in, than to burn it. It helps make a cheap and warm hovel for cattle, before the settler has time to build his barn. Save the straw, for even the virgin soil will soon need it to keep up its fertility.

Dairy Cattle—Ayrshires.

It is not a great many years since the breeders of Great Britain discovered a beautiful breed of cattle, having great excellences and strong characteristics, among the lowland Scotch, in a district where but a few years before, a very undesirable native breed had existed. It appears that the chief improvements in the cattle of the district of which the county of Ayr comprises the principal part, were made by the introduction of Dutch and Short-horn blood, for the purpose of increasing milk-giving and feeding qualities. There is little doubt, however, that good breeding and judicious selection have done quite as much as foreign blood towards the formation of the breed. Even during the past fifteen years the Ayrshires have changed notably, improving in form and uniformity of characteristics. Recent importations are an improvement upon the old, and yet they indicate but little, if any, more rapid advance than has occurred among the herds of our most intelligent breeders.

The Ayrshires have been bred for milk in a country where quantity and quality were both desirable, where the pastures are only moderately rich, and where rapid fattening for the shambles was also a desideratum. The result is a breed of no more than medium size, many being decidedly small, hardy, easy keepers, yielding a large quantity of excellent milk, rich both in butter and cheese. The claim set forth for the cows is that they will give more and better milk on the same fare than cows of any other breed. This, we believe, is not disputed, certainly not by the champions of any British breed. They also are good feeders. Ayrshires have been known in this country since 1822, when we believe the first importation was made. The stock

was kept pure, however, but a few generations, as it became blended with the Short-horns. These animals were recorded as Short-horns in the first volume of the *Am. Short-horn Herd Book*, edited by Mr. L. F. Allen, and it would be interesting to trace their blood, if perchance it may not now flow in some of our noted

Short-horn herds. In 1831 other animals were imported, and ever since that time the breed has grown in favor. Its characteristics are strongly marked. In some respects the breed closely resembles the Short-horn, particularly in general form, the shape of the head and horns, and the delicacy of the limbs. The animals are pre-

excellently liberal feeders. She is characterized by a very fine neck, small bones, a delicate tail, large, broad udder, and immense milk veins. The local colors of the body prevent these veins from showing at all in the photograph, from which we have not departed in the engraving. This cow is grand dam of several of the fine

young animals offered by the Publishers as premiums to canvassers for the *American Agriculturist*. The imported cow "Flora" is the property of Mr. William Birnie, of Springfield, Mass. This cow was the winner of the first prize and also of the sweepstakes prize of the New England Ag'l Society, at Brattleboro, Vt., in 1866. The larger apparent size of the animal, as compared with Dolly's, is through an oversight, as she is not a larger cow. That the Ayrshires are a harder race of cattle than the so-called natives is the

concurrent testimony of those breeders who have given both a fair trial. Their record stands unrivaled as milk producers. The yield of butter varies, but the milk is almost always rich, and that of butter correspondingly large—fully as great as that of the Jersey, though lacking the peculiar Jersey color. The milk is besides very rich in cheese-forming constituents, which gives the cows a high value in the dairy districts both of Great Britain and America. In regard

to the first introduction of Ayrshires into this country we are surprised to notice the importation above alluded to, (which was made by Mr. H. W. Hills, a New York merchant, who sent the bull and cow imported to Mr. Hezekiah Hills, of Windsor, Conn., in the year 1822,) entirely ignored by Mr. Allen, in his recent work on American cattle. This importation has been made the subject of investigation, from the fact that the animals were called Short-horns; and we wonder that it is thus overlooked. These ani-

mals, "Jenny" and "Eclipse," were bought of Mr. John Fifer, an Ayrshire breeder, whose estate was in the immediate vicinity of Glasgow, Scotland. Some of their descendants were famous milkers; one a half Short-horn cow, called "Old Cream Pot," gave 36 quarts of milk per day, and made 18 pounds of butter per week.

Fig. 1.—AYRSHIRE COW "DOLLY 3RD."

vailing of medium size. The cows have great digestive capacity, as indicated by their deep, full bodies. They are almost uniformly large milkers, and excel all the points looked for in judging of the milking capacities of cows. The colors are usually red, spotted with white, the spots being very well defined, often fine, and sprinkled over the body in patches. Animals, more or less brown or black, occasionally occur. We present portraits of two very superior

Fig. 2.—IMPORTED AYRSHIRE COW "FLORA."

cows of this breed. "Dolly 3d," (No. 55 of *Am. Ayrshire Herd Book*), is the property of S. M. & D. Wells, of Wethersfield, Conn. She gave by actual measurement from March 25th, 1866, to Dec. 31st, 1867, inclusive, 10,000 quarts of milk, on no better feed than the rest of the herd of which she is a member; but her owners are

Walks and Talks on the Farm—No. 59.

Three years ago we cut an underdrain through a field that is now in clover, and I observed that the clover seed on the drain was at least twice as good as on the rest of the field. It was not owing to the influence of the drain, or it would have extended for a rod or more on each side. It was just the width of the drain, say a narrow strip of about fifteen inches. The clover was as high again, thicker, heavier, and better everywhere, distinctly marking the whole length of the drain. It can be owing to nothing but deeper tillage. The fact has satisfied me that we do not plow deep enough on my farm, whatever may be the case on others, and henceforth in the fall of the year, I shall aim to put three horses on the plow, and go an inch or two deeper than the land has ever been plowed before. We do not now plow more than six inches deep, on the average, fairly measured. Such plowing was, perhaps, all very well when the country was new and the soil full of "natural manure," derived from the decay of leaves, and the ashes of trees; but on the old fields this source of fertility is nearly exhausted, and we depend now on the decomposition of the soil itself. When the surface soil was full of manure, there was little advantage in turning up two or three additional inches of raw subsoil; but now the subsoil is often much richer than the six inches of surface soil that has been worked for years, and an additional two or three inches brought to the surface in the fall of the year, and left where Jack Frost can tear it to pieces, will soon make capital land. The Deacon put down his new Ward jointer plow ten inches deep in plowing this spring for oats. The subsoil, he had always supposed, was a stiff, raw clay, but he says that this fall, in working this deep plowed land for wheat, he was surprised to find that the three or four inches of new clay that he turned up was gone, and a rich looking, mellow loam left in its place. On my own farm I find that what the men call "clay spots" are not clay at all. Underdrain them, plow them well when dry, work them thoroughly, and they become the best wheat and barley land on the farm, and I think in a few years they will also produce good corn.

The Doctor spent his vacation in Vermont, with some old friends who are farmers. "They all take the *Agriculturist*," he said, "and read the Walks and Talks, and they would like them better if you had more to say about dairying. They charged me to ask you what was the best way to renovate their old meadows and pastures. On one farm there was a wet strip of land in a meadow that produced little but tall, coarse grass, and rushes, and I finally induced the son to dig a ditch through it, and the day I left he went to Rutland for tiles to lay it with. No land could lie better for draining. There is abundance of fall, and yet there are acres and acres, and that of the richest land, that are unproductive, for want of a few ditches. I tried to persuade the young men that it would be far better to stay at home and improve the old farms than to go West, as so many are doing."

When there is much low, rich land on the farms, the way to renovate the meadows and pastures is to drain this rich, but now useless land, and with the large crops which it would afterwards produce, make manure for the poorer portions of the farm. This is the first step, and when once taken the rest is easy. You can make double the quantity of manure. The next step is to improve the *quality* of the manure—

to make one load worth as much as two or three. This can be done by feeding more grain or bran or oil-cake to the cows, and using means to prevent the manure from running to waste. With plenty of rich manure it is an easy matter to renovate the old pastures and meadows. A good pasture ought to support a cow to the acre, with perhaps a little green corn fodder during the dry weather in August. If it would not, I would try hard to make it. Drain every low spot, irrigate wherever it is possible, make the yard or stable manure into piles, and mix with it, at the rate of 500 lbs. per acre, some good bone-dust, or 200 lbs. per acre of Peruvian guano, or perhaps better still, 400 lbs. per acre of some good fish manure, and turn over the pile two or three times, until it is well decomposed, and then top-dress the pasture with it in the fall or early spring, and my word for it the land in a year or two will carry double the stock. "But will it pay?" At present prices of cheese and butter and beef, nothing will pay better. Suppose a man has a 200-acre farm, worth \$100 an acre, that now keeps 50 cows, and he buys 200 acres more for \$20,000, and then keeps 100 cows; on the other hand, suppose instead of paying \$20,000 for the additional 200 acres, he can succeed in making his old farm keep 100 cows, he would have just as large an income, with less taxes, less fences, less roads, and less expenses generally. If the expense of renovating the old farm was \$20,000, he would be just as well off as if he bought 200 acres more land. But it can be done for half the money, and have \$10,000 to buy additional stock and put up new barns.

"What! spend \$10,000 in draining and manuring the old farm, and \$10,000 in additional buildings and stock?"—Why not? But I know it is useless to propose such a thing. It seems easier for a farmer to find \$1,000 to buy more land than to raise fifty to spend in draining and manuring. Farmers have capital enough—many of them, at least—but they have not faith enough in improved farming to use it in enriching their land. As I have said, in the case supposed, it would pay to spend \$20,000 in draining and manuring a 200-acre farm, quite as well as to lay it out in buying a new farm. But of course it would cost no such money. Let a young farmer use \$2,000 for this purpose, and in the course of a few years the old farm would produce double what it does now. In other words, he makes \$2,000 go as far as \$20,000. He would keep as much stock on the 200 acres as on the 400 acres, make as much manure and be able to put on double the quantity per acre, and thus permanently enrich the land.

The Doctor believes in small farms, well tilled, and I knew this kind of reasoning would please him. "The small farms," he said, "are being bought up by the larger farmers in Vermont, and they tear down the old houses, and this makes it difficult to support schools and churches."

The same tendency exists here, and it is useless to argue against it. If the large farmers have capital enough, and are all able and willing to employ it to the best advantage, no great harm will be done. This kind of farming will be more attractive to young men of energy, intelligence, and ambition, and they will be less likely to leave the farm for the excitements of city life. Some of our agricultural writers and speakers complain that the proportion of producers to consumers is rapidly decreasing, and they argue that this is an unhealthy state of things. Perhaps it is, but it is rather strange that farmers should complain of it. Who ever heard a grocer or a dry goods merchant complain that his competitors were leaving the bus-

iness? Do manufacturers complain that the demand for their products is increasing faster than the supply? It looks now as though farmers were about to receive ample compensation for all the skill, intelligence, and enterprise they can bring to their business. Good farming will now pay as it has never paid before. Owing to the high prices, even a poor farmer, if he has a large farm, and is out of debt, manages to make a living, though much of his profits is more apparent than real. A neglected corn crop may pay \$100, and injure the land for future crops to double the amount. But let us figure what a good farmer can do with 400 acres of choice land, every acre capable of yielding large crops, and selling nothing except butter, cheese, meat, wheat, barley, potatoes, and clover seed.

80 acres Wheat, 40 bushels per acre, @ \$2.50	\$2,000
80 " Barley, 50 " " @ \$1.65	\$1,320
80 " Potatoes, 300 " " @ \$1.00	\$800
80 " Clover seed, (2d crop) 4 bus., @ \$8.00	\$2,560
80 " Pasture, keeping 80 cows, @ \$5.00	\$4,000
40 " Corn, roots, &c.	
80 " First crop clover, say equal 100 tons hay.	
1,000 sheep fattened in winter, gain say, \$5.00	\$5,000
	\$26,560

The straw from the wheat, barley, and clover seed, with stalks from 40 acres of corn or roots, with 160 tons of hay, or its equivalent in green food for soiling, and the corn from 40 acres, say 80 bushels per acre, or 3,200 bushels shelled corn, with say 50 tons of oil-cake, would support the stock named and the necessary horses.

The expenses may be estimated at:

Labor, \$12.50 per acre	\$5,000
50 tons oil-cake, @ \$5.00	\$2,500
Artificial manures	\$1,500
Incidental expenses	\$2,560
	\$12,560
Profit.	\$24,000

This is a profit of \$60 per acre, and you will observe that I have said nothing about sundry little perquisites, such as pork, poultry, eggs, etc. These, where so much grain is raised, and so much stock is kept, would amount to quite a little sum. Cannot such results be attained? I know of more than one farmer whose wheat sold this year for \$1.00 per bushel, and on my poor farm I raised on one field 50 bushels of barley per acre, and sold it for \$1.65½ per bushel. It is not a difficult matter to raise 200 bushels of potatoes per acre, and they are now selling at \$1.00 per bushel. With the aid of guano, 300 bushels might be obtained on good land, enriched with manure a year or two previous. The clover seed is a little uncertain on account of the weather. On land as rich, and clear, and mellow, and deep as it should be, drought would seldom be injurious, but in a wet season the growth might be so great that the heads would not fill well. But in this case there would be a splendid second crop of hay, with seed enough in it to much more than pay for thrashing. A good cow, with liberal feeding in winter and summer, will make from 500 to 600 lbs. of cheese in the season, worth now from 17c. to 18c. per lb.—say \$85 to \$108 per cow, so that the above estimate of \$80 is moderate. If we may judge from past experience it is safe to estimate that a good sheep, costing, say \$4.00 in the fall, will be worth, if well fattened, at least \$9.00 in the spring. And in fact, at current rates, the food will cost \$5.00 a head. All the above estimates, therefore, are quite within the bounds of probability. And it is equally sure that a farm once capable of producing such crops can be maintained at this high state of fertility. There will be consumed on the farm, say:

100 Tons Wheat straw.	50 Tons Oil-cake.
100 Tons Barley straw.	90 Tons Corn meal (3,300 bushels).
80 Tons Corn stalks.	
160 Tons Clover hay.	
60 Tons Clover seed hay.	160 Tons.

This would make from 1,500 to 2,000 loads of good manure, which in connection with \$2,500

worth of guano, bones, or other fertilizers, would keep up (and in fact, greatly increase) the fertility of the land—especially of the pastures.

This is what may be. Let us look at what is. Here is a naturally good, but somewhat run-down, farm of 400 acres, on which "me and my boys, with two hired men and a couple of extra hands in harvest, do all the work." There are:

40 acres of Wheat,	12 bush. per acre.	@ \$2.10...	\$1,008
20 " " Oats,	40 " "	@ .65...	520
20 " " Barley,	20 " "	@ \$1.50...	300
25 " " Corn,	40 " "	@ \$1.00...	550
10 " " Potatoes,	80 " "	@ \$1.00...	800
20 " " Buckwheat,	15 " "	@ .90...	370
14 Cows,	100 lbs. @ 25c.		35
11 Calves sold to the butcher @ \$7.			77
10 Hogs, 370 lbs. @ 10c.			37
300 Sheep, shearing 4 lbs. wool @ 55c.			165
60 Lambs sold to the butcher @ \$2.50.			150
80 Acres hay, 15 cwt. per acre, @ \$15 per ton.			900
40 Acres Clover hay, 1 ton per acre, @ \$10.			400
40 Acres Clover seed, 1 bush. per acre, @ \$5.			200
3 Acres apples and cider.			600

\$7,035

Expenses.

"Me and two boys," say.....	\$ 750.00
2 Men, 8 months and board.....	600.00
Extra help, thrashing, etc.....	400.00
Half of the hay, corn, and oats, fed to horses, pigs, etc., on the farm.....	1,335.00
Incidental expenses, repairs, etc.....	1,500.00
Seed, 80 bushels Wheat @ \$2.10.....	168.00
50 bushels Oats, @ .65.....	32.50
40 bushels Barley, @ \$1.50.....	60.00
100 bushels Potatoes, @ \$1.00.....	100.00
7 bushels Corn, @ \$1.00.....	7.00
10 bushels Buckwheat, @ .90.....	9.00
10 bushels Clover, @ \$5.00.....	50.00
10 bushels Timothy, @ \$3.00.....	30.00

\$1,971.50

Profit.....\$2,651.50

This is apparently quite a respectable profit, but the farm is getting worse and worse every year. Land in the neighborhood is worth \$150 an acre, naturally no better than this. This farm would be dear at \$100, and if "me and my boys" continue to sell the hay and let what little manure there is made run to waste, how long will it be before it is worth less than \$75? This man thinks I am ruining myself because I spend nearly \$8.00 an acre every year on my farm for labor, and perhaps I am; but my land is getting that much better every year, and his is getting that much worse. It is desirable to get along with as little manual labor as possible, but it certainly will not pay to neglect the land and let the weeds get full possession, as they now threaten to do on many farms. Let us drain the land, cultivate it thoroughly, make plenty of rich manure, and farming will pay. If we cannot do this on a large farm, let us sell and buy a smaller one, until we have the capital required to manage the farm to the best advantage.

One of our nurserymen sent a man to Michigan to buy sheep to fatten this winter. He bought 400 good wethers, three and four year-old, that average about 95 lbs. each, at a cost here of \$3.10. His object is to make manure. He gets about a load of manure to a sheep, worth \$4.00 or \$5.00. He has adopted this plan three or four years, and his land already shows the effect. He thinks it far better manure than that which he draws from the city. I told him if he would use oil-cake instead of corn the manure would be richer still. There will be a great many damaged beans this year, which, if not mouldy, can be fed to sheep with advantage. And the manure from beans or peas is nearly as rich as that from oil-cake.

We have not had such bad weather for harvesting beans for four years. I have usually pulled the beans and placed them in small heaps on the ground, and if we have dry weather, this answers very well. I did so this year, and the day after we finished pulling, it commenced to rain, and rained more or less nearly every day for a week. We turned the beans as often as possible, but many of them moulded and rotted, and not a few sprouted. Had I

adopted the plan recommended in the September *Agriculturist*, it would have been a hundred dollars in my pocket. Some of my neighbors did so, and the beans kept perfectly safe. Mine will have to be hand-picked, at an expense, say of 25 cents per bushel, or \$5.00 an acre. Two dollars an acre would have covered the whole expense of stacking them, and I should have saved all the fodder, which is now worthless.

Deep and Shallow Culture.

There are many soils in the world which yield fairly remunerative crops, for an indefinite number of years, (say 99), without manure of any kind, and with only a modicum of tillage. The reason is found in the fact that these soils decompose very uniformly, by the action of plows, harrows, and weather, combined, and so furnish just about as much plant-food each year as the crops require. Some of the Black Sea wheat lands are said to be of this character. Here wheat has been raised for hundreds of years without manure; the yield is very uniform and remunerative, though small. All tolerable soils contain in great abundance all the ingredients requisite to make good crops of grain, but they are not all available. By tillage, by mixing decomposing substances with the soil, and by exposing it to the action of the weather, sunlight, heat, dryness, freezing, and moisture, combine to influence the decomposition and disintegration of all parts of the soil. Some soils are much more susceptible to these influences than others, and so require less tillage and less manure to produce the effects seen in other soils. The more thoroughly and the deeper the soil is stirred and exposed to the action of the weather and of manure, the more available plant-food will be annually produced from its disintegration. Manure, besides, supplies any deficiency which may exist, and enables us to obtain much more nearly maximum crops. Were the supply of ammonia which is obtained from the air abundant, a sufficient amount of ash-ingredients could be obtained from almost any fair soil, by a sufficient amount of cultivation. The problem for the farmer is, what amount of tillage he can profitably apply for any series of crops.

Tillage is really of two kinds, deep tillage and surface culture. As a rule, the deeper the soil is stirred, the more will it be exposed to the action of the elements, and the more plant-food will be formed. In poor soils this is diffused through great masses, and for this reason available to but few plants. For such as feed near the surface, (wheat, for instance), surface cultivation and manuring are usually imperative.

Very fair plowing is six inches deep, which is deep enough to plow for small grains. In plowing for other crops, if manure is abundant, or the soil rich, the soil may be gradually deepened until we reach the ordinary limit of plowing—about 10 inches. We go below this with the subsoil plow, and simply loosen and let the air into the soil below, when it is plowed, which is an exceedingly beneficial operation, and equally advantageous upon shallow and deep-plowed land. Where deep, thorough drainage is practised, which virtually extends some of the effects sought by tillage (namely, exposure of the soil to the action of the air) to a depth of several feet, the plants quickly respond. The effects of tillage, however, go on most rapidly on the surface, and here it is that it is desirable to do the most work. For surface culture we have the harrow, in all its varieties, adapted to pulverizing and stirring the ground

to a depth of about three inches. In this country our assortment of scarifiers is small, but in Great Britain and upon the Continent, many different kinds are used, under the name of cultivators, scarifiers, clod crushers, harrows, etc., which are used in bare fields. The variety of surface workers, (horse-hoes, cultivators, etc.) to be used among the growing crops, is well-nigh endless. These obviously serve a double purpose, and not only stir the soil, but kill weeds and give fresh earth to the plants, to some extent.

Deep and shallow tillage are not incompatible on the same land. In fact, the only really thorough culture consists of both; and where the soil is in a fair state of fertility, and will bear good crops of clover or corn, the system followed should always be *deep breaking and shallow after tillage*, with surface manuring when small grains and grass form part of the rotation.

Experiments in Wheat Culture.—Drilling, and Horse-Hoeing.

The Secretary of the Goodline Farmers' Club, of Minnesota, communicates to the *American Agriculturist* the following interesting statement in regard to some experiments in wheat culture made by one of the members of the Club.

Field No. 1.—Two bushels to the acre was sown with the broadest sower and cultivator combined, and the seed was planted at all depths from the surface, to 3 or 4 inches deep.

Field No. 2.—Was sown with a common wheat drill, east and west, one and a quarter bushels being used to the acre, planted about 2½ inches deep.

Field No. 3.—Three pecks of seed were drilled in, east and west, 2½ inches deep, and 18 inches apart. It was cultivated but once when about a foot high, with a 5-toothed walking cultivator, at an expense of \$1 per acre.

The results are thus stated: "No. 1 was good wheat, not damaged by heat, head medium in length, well filled, stood thick upon the ground. Was unequal, some straws 5 and 6 feet in length, and some only 2 feet. Some heads were very green while others were ripe. The yield is estimated at from 20 to 25 bushels per acre. No. 2 was of a better color during growth than No. 1. Very even in straw and degree of ripeness. Heads about even, of extra length. Bundles very heavy, and the yield is estimated at 30 bushels per acre. No. 3 was extra at all times. Its unusual deep green color and broad leaves attracted much attention. No one supposed it the same kind of grain as lots 1 and 2. It stood out much more than either Nos. 1 or 2. It was uniform in length of straw and degree of ripeness. The heads would average one-third larger than No. 1, and the largest and heaviest wheat we ever saw. Strangers here picked for the smallest heads, and then shelled from 60 to 80 kernels from each head. Our binders (and we had some from other States who had had much experience), said they never saw such large heads or such heavy wheat of this kind, namely, China Tea. The yield is estimated at 35 or 40 bushels per acre."

The Club arrives at the conclusion that they have been in the habit of using too much seed for spring wheat; that wheat needs cultivating; that if half a bushel of seed were used per acre, and sowed in drills 15 inches apart, and thoroughly cultivated, the average crop of Wisconsin might be doubled. They recommend, moreover, the expenditure of the price of the seed saved in giving the land a more thorough harrowing. In this they are wise; there is nothing

to which wheat so quickly responds as thorough tillage, and it may be a question whether this should be done previous to sowing or after the grain is up. There are other interesting subjects for investigation before any one can speak with authority. The exact amount of seed per acre, though depending in a measure upon the kind of wheat and the character of the soil, may be nearly approximated. The distance apart of the drills is another subject for experiment; 20 inches has been recommended. It is difficult to cultivate between those which are much nearer, and no doubt the roots will fill the ground between them at this distance.

Shelter for Manure.

The difference in value between sheltered and unsheltered manure is sometimes immense, and

Fig. 1.—DIAGRAM SHOWING MANURE PIT.

sometimes not very great. That which is suffered to become dry, very rapidly deteriorates, while that which is constantly moist or wet, (yet is never washed), and frequently receiving additions upon its surface, loses but a little, if any, part of its value. It is, in fact, under cover. Still, there is always a surface portion liable to become dry after fermentation and decay have taken place and ammonia is formed, in which case it would deteriorate. It is not alone to preserve animal manure that agriculturists advise that it be kept in cellars or under cover in some way. It rots faster, its decay is more easily regulated, and it is more easily composted and mixed with vegetable matter, and the fermentation which it induces in the mass is much more uniform. Besides, it becomes the breeding place and food of fewer maggots, etc.

Old-fashioned barns all over the country may be seen disfigured by the dark (or light) stains of the regular winter dung heaps, which, year after year, have accumulated under the windows

of the *Agriculturist*, and we are frequently inquired of how they may be conveniently modified, and how the manure may be kept to best advantage outside of them. We suggest three ways. The barn may be raised 2 to 6 feet, and a cellar dug beneath, which would require the moving of 2 to 5 feet of earth to give a cellar 7 feet high in the clear, which is low enough.

To illustrate another way we have introduced a diagram, fig. 1, representing the cross section of an old-fashioned barn with cattle stables (*a a*) on each side of the floor. The floor is raised away; its place is indicated by the dotted line, *b*. A new floor (*c*) is placed some 5 feet above the old one, new posts being set, if necessary, to support the timbers. Under the floor a pit (*m*) is dug for manure. The cattle are faced to the outside and foddered from the floor above. A raised approach is made for reaching the thrashing floor, and under it, or at the opposite end of the barn, is a passage gradually sloping to the bottom of the manure pit. The raising of the barn floor may necessitate the removal of the cross beams (*d*) above, and if this be done it may be desirable to brace the center posts in some way, as indicated by the dotted lines at *e, e*.

Another, and the cheapest, and yet an efficient way is to build lean-to sheds along the sides of the barn, over a manure pit. This is shown in figs. 2 and 3. The old stains are seen on the sides of the building under the windows. The pit is 4 feet deep, 12 feet wide, and as long as the barn. A slanting passage-way for carts in and out, to save high pitching, is provided at one end. The pit walls are laid in cement, and the bottom is a substantial grouting of stones and cement. In the middle near the outside a hole is made about three feet wide, by two deep, which is cemented also, and covered with a stone. The floor slopes toward this, and if there is water anywhere it will find its way here, and may be

Fig. 3.—SECTION OF MANURE PIT.

pumped up and spread upon the heap. The sides of the shed may be boarded down to prevent snow and rain blowing in, but it is usually the case that a moderate supply of water from within is needed, and must be added in some way.

Winter Care of Fowls.

Poultry keeping is one of the most fascinating of all employments to one who will devote his best thoughts to the business, and really love his fowls, and geese, and ducks, and whatever else his yards may have. All varieties of barn-door fowls are more or less tender; they freeze their combs and feet, and if not in sound health, often freeze to death. In severe weather all their natural forces are directed towards keeping warm; growth ceases, egg laying and fattening cease, and of course the profit of keeping hens ceases also, so long as severe weather lasts, if we do not give sufficient protection. Good poultry houses have been repeatedly described in the *American Agriculturist*, and double walls filled with sawdust or tanbark, great greenhouse windows on the south or south-east side, arrangements for ventilation, and several of the most desirable appointments, as nest boxes, water fountains, roosts, etc., recommended.

As winter comes on, we ought to be beforehand in preparing comfortable winter quarters for our fowls. The old houses, if, as is usually

the case, they are only frames boarded on the outside, should be lathed and plastered, or lined with matched boards, and the spaces filled with planing-mill shavings, sawdust, swamp hay, or some similar substance. The floor should be covered with several inches of dry sand, and

Fig. 1.—PLAN OF FOWL-HOUSE.

the ventilating holes near the roof should be partly stopped, or shutters arranged so as to close most of them in very cold weather. Nothing is more important to the health of fowls than pure air. Birds breathe with great rapidity, and maintain a corresponding degree of heat in their bodies; hence they vitiate great quantities of air. It frequently happens when persons suppose they have taken the best possible care of their fowls, but have neglected ventilation, that fine birds are found dead under the perches, when no cause can be assigned. The fowls on the upper perches become oppressed with the carbonic acid in the air, finally lose consciousness, and as soon as the muscles relax, they drop from their roosts in this condition, and are frequently stone dead or too far gone to recover. On this account it is well to have all the roosts rather low. For very heavy fowls, like Brahmas or Cochins, they should not be over 3 feet high. The feet of fowls never freeze when they roost on broad perches, for then the feathers of the body cover the feet completely.

Fires in poultry houses are not so absurd as they may appear at first thought. When eggs are 5 or 6 cents apiece, it will pay to take some pains to have plenty. They may usually be secured by having the hens in warm quarters, but in unheated houses three or four very cold days and nights will so chill the fowls that but few if any more eggs will be laid for a week or two. This may be entirely obviated by having a stove in the chicken house, in which fire is made on very cold nights. Fig. 1 is the ground plan of a fowl house, in size 20 x 12 feet, divided by a lattice work partition into two rooms, 12 x 14 and 6 x 12 feet. The plan supposes two large windows on the south, roosts on the east, a feeding floor under the windows, and nest boxes on the north side. The little room is for entrance, store-room, fire-room, and hatching

Fig. 2.—SECTION OF FOWL-HOUSE.

apartment for very early chickens. A pit to contain a small stove is dug 3 x 4 x 4 feet, and entered by three steps. The pipe is of common glazed drain tiles, and passes underground

Fig. 2.—LEAN-TO MANURE PIT.

of both cattle and horse stables. No doubt thousands of such barns are owned by readers

nearly to the floor beneath the roosts, and then up, as shown in fig. 2. This pipe is covered with about a foot of dry sand, and the warmth is diffused into the sand on all sides. It is important that there should be no moisture in the soil or sand which forms the floor of the house, and it would be well to cement the floor and the trench in which the pipe is laid. But, though the ground around the sides of the house may freeze, and so be made moist and muddy by an underground fire, yet we are confident such an arrangement of floors as we have indicated would prevent any difficulty from this source. The object of placing the stove underground is to have a diffused warmth, lasting long after the fire goes out. We have repeatedly made use of underground fires and flues, but not for this purpose, yet recommend them with confidence. A mass of moderately heated sand remains warm a very long time, and diffuses a mild and agreeable warmth. The same end may be accomplished by a brick stove, or any stove enclosed in a double wall and arch of bricks.

Growing Interest in Blooded Stock.

Hardly any thing can rejoice the intelligent agriculturist more than evidence that the farmers are taking increasing interest in raising pure and grade stock. We have often said, and say now again, that no sensible farmer, if he can help it, will use a grade, or mongrel bull, as a sire for stock he expects to raise. The use of thoroughbred bulls pays, even if the calves be slaughtered for veal; and it is a hundred times more important if they are to be raised. The question is asked us very often, "What sort of a blood bull ought I to buy?" We only help each man to decide this question for himself.

Short-horns are preëminently a beef race; still, among the cows, large milkers are frequently found. The grades usually make deep milkers, but the milk is generally not rich. They require good feeding all the time, and when fed for market, feed very economically. They reach maturity earlier than any other breed.

The *Devons* are very different. They are an ancient race, and though somewhat improved in beef points, have changed little in the historic period. They are red, with long, white horns, beautiful heads, short limbs, long bodies, and straight backs. They will pick up a good living on rough pastures, in the woods, or cane-brakes, where *Short-horns* would almost starve. They give good milk, which is lacking chiefly in water (and this may be added, if desired). The calves are small; the bulls reach maturity and full size at 5 or 6 years of age, and the cows and steers at 4 or 5, perhaps. As working cattle, *Devons* and *Devon* grades are unsurpassed, on account, chiefly, of their compact, muscular frames, intelligence, and sprightliness.

The *Ayrshires* are the cattle for milk and cheese dairies. See article on another page.

The *Jerscys*, or *Alderneys*, are noted for their very yellow milk, cream, and butter, as we have stated in several recent numbers of the *Agriculturist*. The oxen of neither of these breeds are worth much, but both make superior beef.

These hints will serve as a guide to those of our readers who may wish to select a premium from our live stock list. The *Devons* do well at the South, *Short-horns* do not, as a general rule at least, and we do not know whether *Ayrshires* and *Jerscys* have done well or not. At the North, the last two are reputed to be very hardy, and the same is true of the *Devons*.

Fig. 1.—GETTING OUT MUCK WITH A CRANE.

Getting Out Muck.

Most muck-swamps, or peat-bogs, are accessible in winter, and the common practice is, first to dig ditches that will carry off the bulk of the water down to the lowest possible level; then to throw out the muck upon the surface, and cart it off in winter, when all is frozen hard.

As we go South, however, and in tide-water swamps, the reliance to be placed on a frozen surface diminishes, and it is likely to prove a pitfall and a snare. A "Sunny South" correspondent, who is in straits, sends a sketch of a crane and scoop, with which he proposes to scoop out muck by horse power, where the team will have no footing. Such a plan will not work, but a horse or ox scoop may be easily employed in the following manner: Provide a strong rope, with two simple pulley-blocks. (The rope must be more than four times as long as from where the muck is to be dug to solid ground.) One pulley is fastened upon the firm ground, and the other to a rail or other anchorage in the muck-bed, just half as far from the first pulley as the rope is long. The rope is rove through both pulley-blocks, and a common ox-scoop, or scoop-shovel, is made fast to it, both ends being attached to the bail. Now, if a horse or pair of cattle be attached to any part of this rope, and pull on the line of it, the scoop will be moved forward or backward. If the team start off when the shovel is loaded, and at the farthest point from solid ground, and walk towards the pulley on shore, by the time it is reached the scoop should have reached the land, where the muck may be dumped; and the team, being faced about, will draw the scoop back to the starting point. If the swamp be a narrow one, two teams, attached to the end of a straight rope, alternately pulling and returning, may be made to move a scoop back and forth in the same way, the scoop taking a load from the middle of the swamp, each way, to the shore. We have never seen this done, but it is obviously

Fig. 2.—BUCKET.

quite as practicable as the method with two pulleys, which is sometimes employed in getting out harbor mud, at low water along the coast.

A simple home-made crane for getting out muck, if the distance to firm ground is not over about 50 feet, and equally good, or better, for other purposes, is shown in the engraving, fig. 1. This consists of an upright pole, or mast, say about a foot in diameter, and 25 feet long, pointed, and "stepped" in timber resting upon planks, so that it may have a firm base even on the soft muck, and held in position by three guy ropes. Attached to this is a second pole, or spar, 6 or 8 inches in diameter, and nearly as long. One end of this is made fast to the mast by a simple sling, shown in fig. 2, and the other end is supported at the desired elevation by a rope passing from it to a pulley-block at the top of the mast and down to a belaying block. A bucket, made of half an oil cask, or larger cask, with a bail attached in the manner shown in fig. 3, or in some similar way, is attached to a rope which passes through a block in the upper end of the spar and down its length to the windlass or spool attached to the mast. The bucket is filled by hand, swung round by means of a rope attached to it, or to the crane, and managed by the driver of the team, and its contents dumped into a cart, or it may be, in a heap. The use of this crane, in a nearly horizontal position, is shown in fig. 1, by phantom lines. The extreme reach of the crane is something more than its simple sweep. The simpler methods of direct carting, scooping, or moving out by means of wheelbarrows run upon a plank track, bridging brooks, etc., are much more inexpensive and are preferable, when they can be employed.

Fig. 2.

Tim Bunker on Farmers Getting Rich.

MR. EDITOR.—That Ohio man's letter you sent me touches on a point that a good many folks are thinking about, and I may as well give your big family the benefit of our Hookertown experience. It is fair to let him state the case in his own language. He says: "You had an article last month on the American disease of 'munchness of land,' in which you forgot to mention how those European's live who support their families, and get rich on 5 acres of land. We want to know how as we are very anxious to get rich, and not willing to wait if we can do better. Are their tables loaded with sweetmeats? Do they ride in a splendid carriage with a spotted dog under it, and all the necessary accompaniments of pumpkin seed bonnets and kamel hair shorls, &c.? Have they parlors with costly carpets and furniture, with the company to correspond? Do they drink tea, eat tobacco, and buy out of the grocery the prencipal part of their living? Please to explain the whole thing, and not give us a part of the truth only. This subject of economy is fearfully overlooked, and if you fear your popularity would be compromised by so unpopular a subject, please hand it over to Tim Bunker. I think he will not shrink from the task."

I am often called upon for advice by my neighbors besides what I give in Justice's Court, but it is rather new to have a man from so far out West wanting to know my views. So I had

to take this case to the Farmers' Club, where we get all the Hookertown wisdom boiled down. The topic for discussion, as printed in the Gazette, was, "How can farmers get forehanded?" It called out a full meeting. Deacon Smith, who is about the richest man we have in Hookertown, said the cultivation of special crops was one of the best ways he knew of to make money. "I did not get ahead much as long as I undertook to raise a little of every thing. But when I gave the most of my attention to fruit growing, I found it paid, and I have kept cultivating more and more that which paid best. I always mean to raise what I want for my family on the farm, as far as I can, and then put all the rest of my force upon raising some one thing that will bring in money in a pile. It pays me a great deal better to raise 4 acres of strawberries and get \$2,000 for them clear, than it does to run over 100 acres of land, and get the same amount of money in a dozen different crops."

Jake Frink said: "I hain't got any clear notions on this subject. I've been trying to get forehanded this thirty years, and could never bring it about. I started in debt, and I never could get out. Sometimes the folks have been sick, and doctors' bills eat up all the profits, and sometimes the cattle disease was ragin', and then there want any profits to eat up. Now if any boddy can tell a feller how to git ahead I should like to be a scholar and laru."

Seth Twiggs said he had noticed "that a drinking disease kept a good many folks behindhand. As long as a man has a crook in his elbow he is sartin' to have crooks in other places and he won't see to go straight any where."

George Washington Tucker said: "That sounded a good deal like twitting on facts. I admit I take a drink occasionally with a friend, but as long as I pay for it, I don't see as it's any body's business. The trouble with me is I never could get any land of my own to work. I have always been helping raise other folks' corn and potatoes. A man must have land if he is gwine to git ahead any. As long as rich folks buy up all the land, there ain't any chance for the poor. They talk about ten acres enough. If I could git one acre and a house on to it, I should be as rich as a prince."

So you see, Mr. Editor, Hookertown is not a unit on the way to get rich. Every man has his theory, except Jake Frink, who is all in a muddle, like a good many other people who own much land and don't work it. The secret of getting rich, I take it, all lies in a nutshell; "Spend less than you earn." A man who sees to it that he does that, at the end of every week, month, and year, will be sure to get ahead. It was on this principle that Sally and I begun housekeeping, and every year has seen a little progress, until we have got things fixed up pretty much to suit us. By a fixed habit, we live within our means, and this makes a rich man in Hookertown, or in your city, no matter what his bank account is. We didn't have any carpets on the floors, at first, because I thought the land wanted a carpet of manure a great deal the most. We had sheep, and it wa'n't long before Sally managed to weave a rag carpet, and she didn't have to pay out money for any thing but the dye stuff. By the time this was worn out the money that I kept laying out on the land began to come back so fast that we could have a Brussels carpet in the parlor without running in debt for it. It was rather a proud day when that roll of carpeting was brought into the house. Sally had waited for it a dozen years, and every thread of it came out of her own

bones, as much as if she had spun and wove it all herself. "Every thing that comes into the house must be marked paid" was the motto she started with, and she has stuck to it like a true woman ever since. If a man begins farming with a small capital he must go upon this principle in his housekeeping. All he can afford to run in debt for is his stock in trade, tools, manure, seed, and animals. These pay a big interest, while millinery and furniture, pianos and bronze clocks, cost considerable to keep them agoing. The Europeans of whom that Western man speaks, adopt this principle, if they thrive. The average Irishman or German comes over here with very little money, and no credit. Almost his whole capital is in his person. He works a few years, and saves his money. When he has a few hundred dollars ahead he buys a few acres in the outskirts of the village, puts up a small, plain house, marries a prudent woman, and goes to housekeeping. She does not indulge in carpets, or pumpkin seed bonnets and things to match, but she works as steadily as her husband, and pays her way. She is ready for any kind of woman's work, and is not afraid to use the hoe and spade in the garden. She almost supports the family herself, with her washing, her eggs and milk, and garden truck, while Patrick saves his dollars and invests in more cows, a horse and cart, and more land. In a few years he is done with working other folks' land, and hires men to work his own. He is a tidy farmer, his house and barns are enlarged, his stock increased, his children are well educated and well dressed, and they smell so strong of Plymouth Rock that the old Hookertown families intermarry with them. Now, what is there in an average Yankee that he should not pursue the same course, and pay for what he enjoys in his home before he comes into possession? If he can have a carpet without taking another man's money to pay for it, let him have it. But if he cannot afford it, bare floors will not hurt honest men's feet. Let him keep a carriage if he can afford it, but if he cannot, then drive the box wagon to mill and to meeting. The grist and the sermon will digest just as well. His pride may suffer a little, but his credit won't. "Pay as you go" was the good old maxim of our fathers, and by it they bought and paid for their homes. It would be better if more of their sons and daughters walked in their footsteps. No! my Ohio friend, there is no short, easy road to riches for common folks. You can't do any better than to work right on, and wait for the millinery you can't pay for to-day. You might run in debt for pumpkin seed if you cannot get them in any other way. But the pumpkin seed bonnet will ruin you if you agree to pay for it to-morrow.

Yours to command,

TIMOTHY BUNKER, ESQ.,

Hookertown, Conn., Sept. 15, 1868.

Carting Out Manure in the Fall.

Our springs are often so wet that the planting season is crowded into a very few days, and it greatly helps the hurried labors of seed sowing to have the manure upon the ground. Some of our best farmers cart out the most of their summer-made manure in the fall and early winter, and if the heaps are properly protected the value of the manure will be increased. The advantage of making manure under cover is not that it is kept from moisture, but that the degree of moisture can be regulated, there being neither too much nor too little in any part of the mass.

The compost heap needs water to regulate its fermentation. If it can be so constructed that it will receive just water enough, and so that the surface will not dry, nothing will be lost. The heaps should have six or eight cords of manure each, should be made four or five feet high, well trodden down, with sides sloping at an angle of 45 degrees, to shed a part of the rain, and both top and sides should be covered with a few inches of surface soil or muck. The fermentation will go on through the winter, and when the compost is forked over in the spring previous to spreading, as it should be, it will be found very "short," and better than if it had lain in the open yard all winter. Most farmers have not room enough in their cellars and yards to store all the manure their stock is capable of making, and it is a great advantage to clean out all their accumulations in autumn, as well as spring, and furnish a new supply of muck, loam, or straw, for the winter. A much larger quantity of manure is made by this course. If concentrated manures are used in addition to those made upon the place, they may often be mixed with the yard manure in these compost heaps with good results. The danger of burning the seed, which so often occurs when these artificial manures are applied in the hill in the undiluted state, would be avoided, and if the combined manure be used for spring grain a more even distribution is effected.

In a Bog.—An Agricultural Problem.

Our friend, Titus Oaks, Esq., of Westchester County, occasionally comes in with an agricultural problem, which he thinks will puzzle editors and others. There is a twinkle in his eye, as he half exultingly asks what he'd better do. This is his last statement:

"I am in a bog. Will you help me out? Eight years ago, I bought a piece of land, in the centre of which was a bog-swamp of about 4 acres, with springy land around it. We cut a ditch through it, 14 feet wide, throwing the muck on each side; then cut ditches four feet wide by four feet deep, at right angles, once in four rods. After carting off the muck, the bogs were cut off with sharp spades. We carted on common earth, and a little stable manure, and sowed with Timothy, clover, and red-top. The first year after, we had a fair crop of very good hay. The next, the grass was extra good, the Timothy, in some places, being 5 feet high. I mowed it two or three times a year, and kept the cattle off for five years; but the water grasses gained on the upland grass, starting sooner in the spring and growing later in the fall. For the last three years I have mowed it but once a year, and have turned my cows in to eat the after-growth. Now it is one-half reeds and rushes. The muck was from 3 to 6 feet deep; it has settled 1½ to 2 feet. The muck is more compact, and the water does not drain through, as at first. Tile-draining does well around the swamp, in the gravelly land, but not in the muck, except directly over the drain."

We have here a soft, pasty peat, which is made more and more compact the more water it loses. It is clear no half-way treatment will answer. The drains were deep; they are now 1½ to 2 feet shallower than at first. If, by very deep plowing, sand or upland soil could be mingled with the upper foot of soil, it would not cure the difficulty, though it would help matters. If new drains, 4 feet deep, were dug half way between the others, the relief would only be very local. Paring and burning the

surface might help a little, but not much; besides, the surface was covered with a dressing of common earth, which might interfere with burning. Subsoiling would help a little also, but the trouble is deeper seated than any subsoil plow will run. If tile-drains will not work, we would advise brush drains, of no less depth than the main drains were originally, and that the old drains should be deepened; then, with more earth liberally put on, deep plowing and subsoiling, we think we might almost warrant good crops of corn and grass for five years more. Open drains, for some reason, never do so effective work as covered ones—probably because the sides dry and become partly impervious to water. It would be better to lay tile-drains, two rods apart, (laying the tiles on strips of board would secure a true grade and stability), and it is a matter to be looked closely into whether it would not pay to lay a tile-drain all around the swamp, to keep the water of rains and springs from flowing into the low ground. By all means stop grazing, for the tramping of cattle makes the soil compact, and is one source of the increased difficulty of drainage noticed in our correspondent's statement. We have never had to deal with just such a piece of ground, and if any of our readers have, their experience would doubtless be of value to Squire Oaks, as well as many other readers of the *American Agriculturist*.

Accurate Knowledge on the Farm.

In a recent talk with Squire Oldschool, he advocated the stacking of hay and the winter feeding of cattle at the stack-yard,—two heresies that we have always opposed. His idea was, that it saved labor in storing the hay, in foddering, and in spreading the manure. Had he ever tried any experiments to ascertain how much the hay wasted in value by exposure in the stack, how much more it took to support an animal unsilenced, and how much of the manure dropped around the yard was wasted? He confessed his ignorance on all these points, but thought his animals came out about as well in the spring as any of his neighbors', who put everything in the barn, and he was quite sure he saved one-half the labor. Now these, and a great many other disputed points in husbandry can be definitely settled by the scales. Weigh four bullocks on the 1st of December, and feed them at the stack sixty days, weighing the hay they consume and the animals at the close of the trial. Put four others in a good barn, well ventilated, and give them the same daily allowance of hay, and water at the barn temperature, and weigh them at the close of the same period. The amount of flesh gained in the two cases would be a pretty good indication of the respective value of the two practices. If two pounds of hay in the barn made as much flesh as three pounds out of it, the advantage of shelter would be clearly indicated. If, on the other hand, the out-door feeding showed the better results, that would be a good reason for the continuance of the old, and, we may add, the still prevailing practice. Feed equal quantities of stack hay and barn-cured hay to the same animals, for the same periods, and ascertain the flesh made in the two cases, and you will have some reliable basis for an opinion of the respective values of hay cured by the two processes. The manure of the four animals fed at the stack might be confined to a half acre, and that made in the barn, from the other bullocks, using the same amount of fodder, might be spread upon

another half acre of land, in equally good condition. If the sheltered manure showed crops twice as large, we should gain some definite knowledge of the waste of manures at the stack-yard. These experiments, of course, involve some painstaking and expense, but, if fairly made, they would determine something, and lead to better husbandry. They would prove a much better investment than more land, or more railroad stock. We want more accurate knowledge, ascertained from careful experiments. This kind of knowledge—the personal experience of practical men—we are most anxious to secure and spread before our readers. The doctrine is certainly true, and has been demonstrated again and again. That which convinces our substantial, old-school farmers, is what they can prove for themselves.

Make More Butter.

Butter is very high, and it is desirable to increase the supply of an article in such general use.

There is but one way of doing this. We cannot increase the number of cows so as to meet the demand this fall and winter, but we can by liberal feeding enable the cows that we have to give more milk, or at least we can get milk containing from one-third to one-half more butter. That liberal feeding will do this there can be no question. What extra food to give depends on circumstances. The quality of the grass at this season is apt to deteriorate, and even when there is an abundance of it, a little richer food can be given to the cows with great advantage. When grass is short, there is still greater necessity for, and advantage in, providing extra food. In many sections there is much corn imperfectly cared, and there can be no better way of disposing of it than to feed it out, stalks and all, to milk cows. This will save husking. If well cured and put in small stacks, or in a barn, with layers of straw between the corn, very few of the soft ears will mould. A liberal supply of such fodder will keep up the flow of milk until Christmas, and if the cows are provided with warm stables, butter may be made nearly all winter.

When there is no fodder of this kind on the farm, feed ordinary corn stalks, or hay and straw, with a liberal allowance of some kind of grain or of oil-cake. Probably corn meal is the cheapest food that can be used, and so far as the writer's experience extends, he has never found any trouble in using it. Four quarts a day to each cow have been used with great advantage, and at the present price of butter such feeding is quite profitable. Some dairymen prefer to feed half corn meal and half bran. When peas can be obtained at about the same price as corn, a mixture of equal parts of corn and pea-meal is perhaps the very best food that can be given to a cow. If wheat bran was cheap, say but a little higher than hay, we would feed that also.

But our object is not so much to say which is the best grain to feed milk cows, as to urge farmers to feed grain of some kind. It does not so much matter what,—only give the cows a liberal supply of food, and they will return a liberal supply of butter. The kind of grain and the way of feeding is left to the judgment and good sense of the readers. When it is convenient it is better to "slop" the cows, but if not convenient the fodder may be chaffed and moistened with water, and a due proportion of meal mixed with it, care being taken that the mangers are so constructed as to avoid waste. With a good supply of food, regularity in feeding, comfortable stables cleaned out daily, prop-

er ventilation, and water easily accessible, there is no trouble in doubling the ordinary quantity of butter from now until mid-winter or later.

Wood Ashes as a Fertilizer.

This is one of the most valuable fertilizers within reach of the farmer. The unleached article has the more potash, but the leached is thought to be quite as valuable. In leaching they shrink a good deal, and lime is usually added, which increases their value. They are generally sold, too, at a less price. Ashes are well suited to all farm crops, and are very beneficial in the fruit yard and orchard. Most farmers still sell wood in the cities and villages, and rather than go home empty, they should carry back ashes and other fertilizers, to replace the potash, lime, and phosphoric acid that have been carried off in the crops and animals sold. Ashes show immediate effects from their application, and at the same time last long in the soil. They are very highly appreciated in the onion growing districts, but may be applied with equal advantage to ordinary farm crops. They should be kept as near the surface as possible, spread and harrowed into the seed bed, or applied directly to the growing crops. Make a business of saving, buying, and storing ashes during the winter for the next season's operations.

A Defect in the Pennsylvania Rotation.

The presence of daisies, flea bane, and other weeds so generally visible in the districts where the Pennsylvania rotation prevails, leads us to doubt its perfection. This system embraces, 1st, corn upon a limed sod; 2d, oats or fallow; 3d, wheat upon well manured stubble or fallow; 4th, clover; 5th, Timothy, one or two years. The system is, on the whole, an excellent one, and the fact that it is so generally adopted, and keeps up the fertility of the soil, is the best testimony we could have to its utility. But the result is weeds, very largely mixed with the clover and Timothy, damaging their quality and frequently rendering the clover and hay seed from these districts a very bad bargain to the purchaser, at any price. The rotation, it will be seen, provides for but one hoed crop, and the cultivation of this is almost exclusively by horse-power. Frequently the rows run but one way, and the cultivator fails to cover or destroy the weeds that grow between the corn. They mature their seeds, and make work for future years. The meadows grow increasingly foul, and the hay is of poorer quality, however abundant it may be. We are not aware that liming has anything to do with the multiplying of these weeds, except as it increases the fertility of the soil. They grow abundantly in land that has never been limed. It is impossible to clean the meadows with a single cultivated crop in the rotation, even with the most careful tillage. It wants two or three seasons of cultivation under hoed crops, and this may be had with corn, which should have manure, or by improving the fallow, which sometimes takes the place of the oat crop to exterminate the weeds. The latter would be the more effectual. By starting early in the season, 8 or 10 crops of weeds could be killed, simply by harrowing the land, after the first plowing, before it would be time to sow wheat. Then, if absolutely clean clover and grass seed were sown, the meadows would present a much more inviting appearance, and the big barns would be filled with a much better quality of hay, and more of it.

[COPYRIGHT SECURED.]

PINNATED GROUSE, OR PRAIRIE CHICKENS. — *Drawn and Engraved for the American Agriculturist.*

This beautiful game bird, now very rare east of the Alleghany Mountains, and only found in New England on Martha's Vineyard and some of the adjacent islands, was once doubtless abundant over all the northern United States. Even now it is more common upon the prairies of the Interior and Western States, than even our domestic fowls. Still it is gradually becoming rare, and the time is not far distant when it will, like the wild turkey, be found only in secluded retreats. This bird is placed by naturalists in a different genus from the Ruffed Grouse, or Partridge, which it resembles in many respects, and is called *Cupidonia cupido*. The bird is about 16½ inches long, and the plumage is barred with whitish brown and brownish yellow, in different degrees of intensity, darker above and of an ashen color beneath. The legs are feathered, or rather clothed with an hair-like covering; and on each side of the neck, covering

a bare spot, is a tuft of slender pointed feathers. When the cocks strut, as they do in the pairing time, like a turkey gobbler, these tufts are expanded and form a sort of half ruffle, and the bare spots of the neck swell out with wind so that in some cases they are said to resemble oranges. The males utter a peculiar note, called tooting, which may be heard a long distance. Prairie chickens frequent the dry prairie, avoiding moisture and thick woods. They breed freely, bear severe winters tolerably well, living upon acorns, berries, buds, and grass seed, when they cannot get grain. During the cold weather they are exceedingly abundant, even in our most eastern markets. Their flesh is brown, more juicy than that of the Partridge, and very well flavored, and will be more and more esteemed. This grouse is not migratory, except as it wanders in the autumn or winter in search of food. At these seasons it is almost invariably

found in companies of ten to twenty, but these separate as the pairing season approaches. Young birds are easily domesticated, at least so as to be perfectly tame, if partially confined; but we have no knowledge of the experiment of their thorough domestication being carried out. It is highly probable that they might become so tame as to lose their desire to stray, and adapt their manners to man's desires and necessities as thoroughly as the wild turkey. The female lays about a dozen eggs, sharply ovoid in shape, and of a dusky drab or grayish color, dotted with brown. The nests are well concealed, and more frequently found by the ruinous tread of a careless foot than by the eye. Those who have tamed them, report that they never drink as other birds do, but take the drops of rain and dew — and this should not be forgotten by those who try to domesticate them, for they doubtless need water like other poultry.

The Virgin's Bower.

After the leaves have fallen there will often be seen in thickets and among the bushes along the roadsides large tufts which look like wool. These, upon examination, will be found attached to a vine, which is our most common species of *Clematis*, (*C. Virginiana*). This vine, being a native, is not often seen in cultivation, but it has merits which give it a claim to a place in the garden. The leaves are three-parted, and like other climbing species of *Clematis*, twist their stalks around other objects and thus serve as tendrils to support the plant. The vine is valuable for its late blooming; the flowers, which appear in July and August, are white, and borne in clusters. The plant is a free flowerer, but some specimens are more showy than others, from the fact that it is sometimes dioecious, and the pistillate flowers make less display than those which bear stamens. Not only is the plant pleasing in flower, but it is quite striking in fruit, on account of the woolly tufts before spoken of. These tufts are made up of the long, hairy tails to the small, seed-like fruits. The engraving gives a small tuft of this woolly fruit, and at one side a few of the fruits separate. The leaf and flower are also shown. Besides the fanciful name of Virgin's Bower, it is sometimes called Traveler's Joy. It is readily transplanted from its native localities. The European Sweet Virgin's Bower, *Clematis Flammula*, has much the habit of our species; the foliage is more delicate, and the flowers delightfully fragrant. Three other native species of *Clematis* are found southward and westward, having larger flowers, which are not in clusters, but solitary, and one, *C. Verticillaris* (formerly *Atragene*), is one of the rarer plants of the northernmost States. None of these, however, equal in beauty the elegant species and varieties with which Japan and China have enriched our collections. Some of these have flowers six inches across, which present various shades of color from white to the richest purple. Great improvement has been made of late by crossing and hybridizing the *Clematis*, and each year some new and attractive varieties are brought out.

The Scuppernong Grape.

Of late, almost every Southern agricultural journal has strongly advocated the cultivation of the Scuppernong grape, and it is claimed that the manufacture of its wine is to become an important branch of industry in those States in which the climate admits of its growth. The grape is a variety of the Bull, or Bullace, grape

of the South, which is botanically the *Vitis vulpina* of Linnaeus, and has also been called *V. rotundifolia* by later authors. The bark does not separate as in other species; the leaves are

which the first named is the best known and most cultivated. The berries of the Scuppernong are from three-fourths of an inch to one inch and a fourth in diameter, and in clusters of

from two to twenty. The engraving is of the natural size, taken from a specimen sent by M. T. Garrett, Halifax Co., N. C. The fruit drops from the cluster when ripe, and is collected by placing sheets on the ground, and shaking or beating the vines. Though what is called a white grape, it is of a greenish yellow color, marked with small brown dots. The skin is very thick and leathery, containing an abundant, rather pleasant juice, with a tough pulp. It has been described as having a "fine musky aroma," but to our notion it is a marked foxiness, a little less disagreeable than that of the Northern Fox-grape. The vine is trained upon horizontal arbors, and is not shortened in by pruning, but allowed to spread over a large space. The fruit is said to be produced on spurs two or more years old, and not, as is the case with other varieties, upon the shoots of the current season. The vines throw out numerous aerial roots a foot or more in length, which, though often injured by winter, are renewed again. In vineyards the vines are planted 20 feet apart each way, or at even

VIRGIN'S BOWER—(*Clematis Virginiana*.)

round heart-shaped, coarsely-toothed, both surfaces smooth, with the lower more shining than the upper; berries few, large, and purple.

greater distances. Vines ten years old are said to yield thirty bushels of fruit, and a single vine is reported as having produced two hundred and fifty bushels at a crop. In the earlier accounts of Scuppernong wine, sugar, and brandy, or whiskey, were considered important additions. Of late, it is claimed that a good wine can be made by the use of one and three-fourths of a pound of sugar to a gallon of juice, and probably when the matter becomes better understood a good article will be produced from the simple juice. The vine is said to flourish from the Potomac southward, and its cultivation is rapidly extending. We notice in the Southern papers the publication of a work by J. Van Buren, of Ga., devoted entirely to the culture of the Scuppernong, but it has not yet reached us. Not having seen the vine in fruit, we have condensed the above account, in part, from the forthcoming Gardening for the South, to which Mr. Van Buren contributed the article on grapes. . . . Since the foregoing was in type, a gentleman who was present at the recent grape exhibition at Hammondsport, N. Y., informs us that the Scuppernong must stood lower than that of any other grape tested. If this be the case, this variety cannot rank among the wine grapes, as no grape can be placed in this class with a must so weak as to make the addition of sugar necessary.

SCUPPERNONG GRAPE.

Parasitic Plants.—The Dodders

The Dodders are so striking in appearance that they naturally attract attention, and a num-

Fig. 1.—COMMON DODDER.

ber of specimens have been sent for the purpose of learning what they were. Not only this, they sometimes injure cultivated plants; one species is a well-known enemy to the flax grower, and we recently had an instance of the appearance of another upon nursery stocks. In France, a Dodder is seriously detrimental to the growth of clover. The Dodders are all true parasites, deriving their sustenance from the plants to which they attach themselves. There are some sixty species enumerated as inhabiting different parts of the world, of which nine are found in the Northern United States. The characters which distinguish our species are for the most part minute, and all that the general reader will care to know are the habits common to the whole. The botanical name of the genus of Dodder is *Cuscuta*, which is of uncertain origin. Starting from the seed, we have a minute, thread-like embryo, which germinates in or on the ground. The little thread uncoils, and soon attaches itself to some other plant by means of a small projection from its surface.

Fig. 2.

live entirely by stealing, the Dodders are without leaves, but have a few minute scales to show where they might be; the color of the plants is yellow or reddish. In figure 1, a small portion of our commonest species, *Cuscuta Gronovii*, is shown of the natural size. The flowers, which appear in late summer or in autumn, are minute, but often in such dense clusters as to be conspicuous in the mass. A single magnified flow-

er is seen in the figure. The Dodders are placed in the Convolvulus Family, as they have some points in common with the Morning-Glory. The little pod which succeeds the flower has four small seeds. In figure 2 we have another species, *Cuscuta compacta*, in which the flowers are densely clustered. This species attacks the Compass plant and other tall Composite plants of the West, and as the stems soon die away and leave only these white cords upon the plant, it is still more puzzling to those unacquainted with it than the others.

While some Dodders show preference for particular plants, others seem to be indiscriminate in their attachments. It is not probable that any of our native species will become troublesome to cultivated plants, the nursery case above referred to being the only one we recollect to have seen; but should the native or foreign ones make an invasion, the only known remedy is to pull up the plants to which they are attached. As the thread-like stems of the Dodders are to be seen long before they flower, it cannot be difficult for those who know the character of the plant to keep it in check.

The Longworth Grape Prize.

The *Agriculturist* has at various times expressed its opinion that there could be no one variety of fruit of any kind, which would suit the whole United States. The Longworth Wine House, of Cincinnati, offered magnificent premiums for wine and table grapes, to be awarded at the Autumn Fair of the Cincinnati Horticultural Society. That any award could be made which would give satisfaction from Maine to California was not to be expected, and had our advice been asked, we should have counseled the Longworth Wine House not to make any such offer. The premiums were offered, the terms published, and the beautiful plate which was to go to the successful competitors, made. When the Committee of Award met, it was found that the Hon. Marshall P. Wilder and Solon Robinson, who were appointed to represent the East, were unable to attend, and the writer was named to fill a vacancy. He accepted the office in full view of the dissatisfaction that the award, however it might go, would bring, and took it in part for his friendly regard for Capt. W. P. Anderson, who has done so much for horticulture in Cincinnati, and also from a desire that the East should be represented on such an important committee. He asks those who dissent from the award, to read its conditions. The Ives was judged to be the best wine grape. We know that there are those who will oppose this verdict. Our answer to these is, that John E. Mottier, known as the veteran wine maker of America, and as a man whose judgment in such matters has always carried the greatest weight, was the most enthusiastic supporter of the Ives. Without other comment we append the report of the Committee. To Capt. W. P. Anderson, Proprietor of Longworth Wine House, Cincinnati, O.:

DEAR SIR—The Committee appointed to decide upon the best Wine Grape of our whole country, the best Wine Grape of the State of Ohio, and the best Table Grape for our whole country, and to distribute your very munificent premiums therefor, beg leave to report that they have examined all the samples of grapes and wine presented to them, carefully and critically, and, after much discussion and deliberation, have made the following decision and award:

For the best Wine Grape for the whole coun-

try—Ives Seedling; and the first premium—silver-plate of the value of \$350—awarded to Lewis Finch, of Plainville, Ohio, he having the best display of that variety present.

For the best Wine Grape for Ohio, the Concord was agreed upon, and the second premium—a silver goblet of the value of \$100—awarded to E. A. Thompson, of Cincinnati, for the best display of that variety.

For the best Table Grape for our whole country, the Concord was agreed upon, and the third premium—a silver cup of the value of \$50—awarded to Frank Murphy, of Cedar Avenue, Ohio, for the second best display of that variety.

Your Committee would also make honorable mention of A. E. Mottier, and others also competing for these premiums, for the fine display of grapes and wine.

Your Committee, aware of the great difficulty of selecting a wine or table grape for the entire country, embracing many degrees of latitude, entered upon the discharge of their duties with many misgivings; they were also restricted by the generous donor in this, "that the plants, when generally cultivated, shall be perfectly healthy, hardy, and productive in all sections of the country," and after a thorough canvass of all the varieties, became satisfied that, although there are better varieties of table grape, yet they are sectional, and will only mature their fruit on certain soils and in certain locations, and that the Ives and Concord are the only known varieties that fulfill the restrictions imposed upon your Committee.

C. W. SPALDING, Missouri,
GEORGE THURBER, New York City,
JOHN E. MOTTIER, Pennsylvania,
GEORGE GRAHAM, Cincinnati,
E. A. THOMPSON, Cincinnati, Chairman,
Committee.

The premium received by Mr. Finch was a silver pitcher, two goblets and a waiter, all of them richly chased and of elegant and appropriate design. The goblet awarded to Mr. Thompson and cup received by Mr. Murphy are both of beautiful proportions and tasteful finish, and bear the emblems of the vine.

Apples for the Southern States.

Not only are our choice Northern varieties unsuited to the Southern States, but it is found that even in the West and Southwest the majority of the best apples are of Southern origin.

Fig. 1.—JULIEN.

We give here a select list of varieties suited to the Southern States, by Mr. J. Van Buren, the

pomologist who has done so much to make known new seedlings of Southern origin, and

Fig. 2.—AROMATIC CAROLINA.

who prepared the article on apples for White's Gardening for the South, now just published.

SUMMER VARIETIES. AUTUMN VARIETIES.

Early Harvest.	Buckingham.
Red June.	Disharoon.
Julien.	Myer's Nonpareil.
Aromatic Carolina.	Autumn Wine.
Sweet Bough.	Rome Beauty.
Red Astrachan.	Meigs.
Toccoa.	Chestatee.

WINTER VARIETIES.

Summerour.	Camak's Sweet.
Van Buren.	Great Unknown.
Mangum.	Webb's Winter.
Cedar Falls.	Mountain Belle.
Elarkee.	Gladney's Red.

Figures and descriptions of some of the varieties above enumerated are appended.

JULIEN.—Fruit, medium size, roundish, tapering somewhat to the eye; calyx, small, in a narrow basin; stem, short, in a moderate cavity; skin, thin, yellowish white, beautifully striped and marbled with carmine; the fruit is of a delicate, waxy appearance; flesh, white, tender, juicy, and fine flavored. The best summer apple known; tree, a fine grower and very productive. The fruit, which ripens the middle of July, is very rarely affected by worms.

AROMATIC CAROLINA.—Fruit, large size; oblate in form, tapering to the eye; stalk, short

Fig. 3.—ELARKEE.

and fleshy, in a deep, wide cavity; calyx, in a wide, shallow basin; color, green, striped with dull crimson, and covered with a white bloom;

juicy, and of a fine aromatic flavor. Tree, a vigorous grower, and very productive. Ripens from the 15th July to the 1st August.

ELARKEE.—Size medium; form conical; color dark red on a yellow ground; flesh yellowish, hard, and with sufficient juice; acid when first gathered, but becomes of pleasant flavor in March and April. Tree thrifty and very hardy. Originated in Macon County, North Carolina.

CHESTATEE.—Medium to large; slightly conical; calyx in a hollow basin; stem short and slender, in a deep cavity, with spots and small specks of black; flesh white and juicy, rather too acid for a dessert fruit, but good for cooking. Ripens in September, and keeps until December.

CAMAK'S SWEET.—Fruit medium to large; nearly round; dull whitish green, mottled with green russet, the patches of which are made up with small dots, with a dull bluish cheek upon the side toward the sun; stem short and slender; cavity and basin broad; calyx closed; flesh firm and tender, scarcely sweet; juicy and fine flavored; best. Keeps sound until February.

Fig. 4.—CHESTATEE.

MOUNTAIN BELLE.—Size medium to large; oblate and conical; color, an orange ground, shaded and striped with red; stem short, in a wide, deep cavity; calyx in a moderate sized, smooth basin; flesh white, hard, and juicy, a little tough in texture, and of a fair sub-acid flavor. Ripens November to May. Fruit of second quality, but a famous keeper. A native of Habersham County, Georgia, found in an old Indian field by J. Van Buren.

EARLY MAY.—Fruit, small, round; skin, thin, yellowish green, when ripe, with sometimes a brownish red cheek; stem, short, in a shallow cavity; calyx, small, closed, in a shallow basin; flesh, yellowish white; flavor, mild acid, but rather astringent; begins to ripen from the 10th to the 20th of May.

VAN BUREN.—Size medium to large; globular, and a little conical in form; color, yellow ground, shaded with dark red, with specks and patches of russet; stem short and fleshy, in a narrow, medium sized cavity; calyx small, and closed in a shallow basin; flesh yellow, juicy, and quite tender for a good keeper. Ripens in October, and keeps until April. A new and

first rate winter apple, found and named by Elijah Sutton, Esq., Habersham County, Ga.

Notes on Grapes and Grape Culture.

Some remarks about pruning intended for this place must go in a condensed form in our customary notes about work. So, also, such notes as we have made on the conduct of the older varieties this season must be postponed in favor of those upon the newer or less known candidates for public favor. Grape-growers generally will be interested in the report of the Committee awarding the Longworth Prize, given in another column. An engraving and description of the Ives grape will be found in the American Horticultural Annual for 1867.

MOTTLED.—This is a seedling about which less has been said than its merits seem to warrant. We hear good accounts of it wherever it has been fruited, and have this year seen bunches which for perfection of form and excellence of fruit, entitle it to a higher rank than it heretofore held. It is "mottled" only when partly ripe.

MOUNT HOPE SEEDLINGS.—Messrs. Ellwanger & Barry, some years ago, raised a large number of seedlings, only one of which, we think, has thus far been considered worthy of exhibition.

It was unfortunate that biped robbers, with or without feathers, took almost the whole crop of their favorite seedling, just before the exhibitions. While they have some twenty or more seedlings, which in other hands might be considered worth propagation, they, with a careful discrimination, reject almost the whole, if not all but one.

UNDERHILL'S SEEDLINGS.—Mr. Stephen Underhill, Croton Point, N. Y., has been engaged in hybridizing our native grapes with foreign pollen. From a last year's review of those that were exhibited at Whitlock's Grape Show, we should say that there were too many of a similar character. Now-a-days, a new grape must have some positive quality, to distinguish it, and while we think Mr. U. has reason to feel encouraged by his experiments we hope he will not follow the example of Mr. Rogers, and put out a series of grapes that are mainly to be distinguished by their labels.

EUAMELAN.—It is a matter of regret that Dr. Grant should have exhibited the Euamelan this season, as the fruit from old vines recently transplanted do not fairly represent the grape. We saw the fruit before the stock of vines was purchased by Dr. G., and regard it as an excellent and very early sort, with more character than is usually to be found in early grapes.

WALTER.—This grape has been sparingly exhibited, but no general estimate can be made of its value until it comes into general cultivation. It has a small bunch, with a very sweet berry, of medium size, and a firm, tough skin.

WYOMING RED.—Exhibited by Dr. S. J. Parker, of Ithaca, N. Y., and we believe a seedling of his. We have not seen it, but it is reported as bearing so strong a resemblance to the Walter as to be liable to be confounded with that variety.

DIANA HAMBURG was on the tables on the first day of the N. Y. State Fair, but was for some reason removed, and we were unable to inspect it. The vine, though strongly foreign in character, has for two years done well in N. Y. City, and promises to retain a place on the amateur list, at least. A large, handsome bunch.

SALEM.—This we have only seen grown in a cold house, where it proved a good bearer, with a decided foreign and very pleasant flavor.

A Neglected Ornamental Tree.—The *Kelreuteria*.

It is curious to see how old and really meritorious plants become crowded out by newer introductions, and are quite lost sight of. Amongst ornamental trees the *Kelreuteria* affords an instance of this neglect. The tree was introduced into England from China, over a century ago, and has been for a long time in this country, yet it is only rarely that we meet with a specimen. Some time ago Mr. Wm. L. Orange, of Edwards Co., Ill., sent us a specimen for a name, and in his accompanying letter of July 6th describes it so well that we quote his account of the tree.

"It certainly is one of the handsomest trees that I have ever seen. The largest one that I have is about 35 ft. high, and has been covered with bloom like a yellow cloud for the last three weeks. The tree makes its growth by the first of June, and from the end of the new wood sends out the flower cluster, which is from 18 inches to 2 feet in length, which branches until each head is from 1 to 2 feet across. The seed pods are shaped somewhat like a grain of buckwheat, and grow about 2 inches long, and become so thick that the stem cannot be seen. The pod is first red, then yellow, and then brown. The trees are very easily raised from seed, and bloom when 3 or 4 years old; they are among the first to put out in the spring, are very hardy, and I never knew anything to eat the leaves. I regard it as the best shade tree that I know of."

The engraving shows the leaf, flower, and fruit, all very much reduced in size. The leaves are of a deep brilliant green, which in autumn turns to a fine yellow. The trees are priced in the nursery catalogues at 50 cents each. Seeds ripen abundantly, but we do not find them in the catalogues of dealers.

A Useful Insect.—The Wheel-Bug.

Some knowledge of insects is desirable for the farmer and gardener, if he be only to enable him to distinguish his friends from his enemies. There are many insects which are beneficial besides those yielding honey and silk, and they are useful from the fact that they are carnivorous. During a recent visit to a pomologist in Delaware, we saw numbers of the Wheel-bugs,

FIG. 1.—WHEEL-BUG—MALE.

Reduvius noenarius, which are so useful in destroying caterpillars, that our friend protects them with great care. The insect is striking in appearance, as will be seen from the engravings, of which figure 1 is the male, and fig. 2 is the female. The singular form of the insect, together with the curious semicircular ridge upon its back, will enable any one to recognize it. This ridge is marked with protuberances, and gives to the insect the common name of Wheel-bug. The eggs are deposited upon the bark of trees, fences, etc., in a more or less perfectly hexagonal cluster, as shown in figure 3. The proboscis is long and sharp, and when not in use, is fold-

ed, as seen in the figures. The movements of the insect are curious to watch; it moves its long legs and feelers with the greatest caution in approaching its prey, which it despatches with a thrust of its formidable weapon. It

KELREUTERIA.

should be handled with caution, as upon provocation it will sting and produce more pain than a bee. Prof. Glover, of the Agricultural Department, says: "It is constantly employed from the moment it hatches from the egg in destroying caterpillars and other insects, by first piercing them and then sucking out the juices. * * * The young ones when first hatched are of a red color, and while they are young their food is plant-lice and other small insects, and when they are not doing nothing else they destroy each other. As they grow larger, they shed their skin, and their food is then large caterpillars, or indeed any insect that they can overpower. A dozen of these insects, if placed near one of the web nests of the caterpillar, so destructive to fruit and shade trees, will destroy almost every caterpillar in it, as each one is able to kill and devour several daily." Having given the amiable qualities of the Wheel-bug, we must mention one very disagreeable one. When disturbed it gives off a most repulsive odor, similar to, and quite as potent, as that of the common squash-bug (*Coris tricolor*). For this, however, it may be excused, for though scientifically related to that disgusting insect, it is a vastly more useful one in orchards and gardens.

Make Poudrette for the Garden.

It is in the power of every family to supply its kitchen garden with a great abundance of manure, at the expense of a little attention and very little labor. The fact that dry earth is a complete deodorizer of the most offensive sub-

stances has been known and employed practically for hundreds of years. Of late great attention has been given to the subject of dry earth closets in England, and to this allusion has been repeatedly made in these pages. This is a most

valuable application of the disinfecting and absorbent qualities of well-dried earth, and is in this wise: Common soil is raked over, to pulverize it, run through a screen, to free it from stones, sticks, etc., then spread in the sun or under cover on boards to dry. In dry weather it is barrelled or placed in bins, and stored for use. It is used thus: The privies or earth-closets are arranged in various ways, but all so as to admit of half a pound or more of the dry earth being thrown into them whenever used, and of all the contents being occasionally thoroughly commingled. It requires about a pound and a half of earth per day for each individual who uses the closet, to cause complete disinfection and deodorization. The contents become slightly moist, and when the box, drawer, or other receptacle, becomes full, they are removed, and exposed to the sun or dry air for desiccation. When dry the earth is again made use of, and so employed four or five times, or perhaps more, before it loses perceptibly its purifying qualities. We shall undoubtedly have, before long, any number of patented contrivances for earth-closets to be used in dwellings, in sick chambers, and similar places. There is, however, no occasion for our readers to wait for these patented articles to be put upon the market before they avail themselves of the properties of dry earth. Nothing is simpler than to arrange a privy with a good-sized drawer, sixteen or eighteen inches deep, and to procure a

supply of earth to last during the cold weather. Of course the earth need not be used twice if it is more convenient to provide a constantly fresh supply than to re-dry that once employed. If the contents be mingled by a hoe or shovel once a week or oftener, if the family be large, it will be all-sufficient; the poudrette will be made, and all offensiveness prevented, summer or winter. If the location be such that the contents of the drawer freeze solid in extreme

FIG. 3. EGGS.

FIG. 2.—WHEEL-BUG—FEMALE.

weather, no harm will occur, though the commingling of the ingredients will be prevented.

A great many village gardens languish from the lack of manure. Really good, well-rotted manure is hard to get, and it is often costly; so guano, superphosphate, and other commercial fertilizers are employed. At first they do well, but after a while things do not flourish as if they had good liberal dressings of barn-yard manure. Poudrette, saved in the way proposed, will take the place of the best stable or yard manure.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Sea-side Fare.—Scallops.

Scallop shells are the sea shells that are best known to those who live far inland, as their beauty of form

to. Scallops are stewed much in the same way as oysters, but as they have no liquor of their own, milk, or milk and water is added. They require to be cooked slowly for about 10 minutes, or until opaque white to the center. Season with butter, pepper, and salt. They need much more salt than oysters. To fry, cover the scallops with Indian meal, or finely powdered cracker, as for oysters,

then cook in plenty of fat, to a rich brown. While they must be cooked quite through, they should not be shrunken. Baked scallops are done in a dish the bottom of which is first covered with a thin layer of fine bread crumbs, then a layer of scallops, another of crumbs, and so on; when the dish is filled, cover with thin slices of bread, well buttered; use salt and pepper as the materials are put in. Bake in a moderate oven 20 to 30 minutes. Large scallop shells are sometimes used as dishes in which to cook oysters and other things in a fancy

way; hence we have "scalloped" oysters, chicken, etc. In England they have scalloped scallops. The scallops are first stewed, then chopped, mixed with bread crumbs, seasoned and buttered, put into the shells, and placed in an oven until browned.

About Pickles.

Although "Aunt Hattie" had a great deal to say about pickles last month, it seems from the inquiries we have had that she did not touch all the points, and we will endeavor to answer a number of correspondents in a sort of mixed pickle article, in which each must pick out his or her own answer.

Almost any vegetable used as food will make pickles; if it has no character itself, one can be imparted by the use of spices. In pickling it seems to be necessary that the vegetable should, as a general thing, first be placed in salt and water. Most things put directly into vinegar do not make good pickles. A pound of salt to two quarts of water is the average strength, and in this the article to be pickled may remain a few hours, or over night; then drain and add hot or cold vinegar, plain or spiced, as may be. Articles for pickles that have been put down in salt for keeping need a great deal of soaking, in order to freshen and plump them. The water should be repeatedly changed, until the pickles are fresh enough, and the process is hastened if warm water be used. Complaint is made that stores will not buy "home made" pickles, but send a long distance for those put up in factories. Store-keepers buy what will sell. Most people purchase an article that is attractive in appearance in preference to one that is not so. Pickles put up in whiskey vinegar look better than those in cider vinegar, and consequently sell more readily. Good cider vinegar gives the best flavor. Many ask us about the clear vinegar with which the bottled pickles are prepared. This is whiskey vinegar; when good, it is perfectly wholesome, and being colorless, pickles made with it look well, but they lack the aroma of those made with cider vinegar. This whiskey vinegar is sold under the name of white-wine vinegar. Pickles are always best kept in glass jars or in wooden vessels. In boiling the vinegar, use a glazed kettle or a tin one; in the latter case, let it remain as short a time as possible. If the pickles are green, all right, but do not trouble about the color, if they only taste well. They can be made green by the use of copper vessels—but don't do it. A kind of pickle is imported under the name of Picallily, Chowchow, etc., which consists of cucumbers, cauliflowers, onions, beans, etc., in a thick, rich, yellow pickle. One English concern is celebrated for the manufacture of this, and we have had several in-

quiries for directions to prepare it. We have tried several recipes without producing an article equal to the imported. We give the last recipe we have received for Picallily from an English source. "Take a pound each of ginger root, garlic, black pepper, and mustard seed, $\frac{3}{4}$ oz. Tumeric root, some cayenne pepper, and one quart of vinegar. Soak the ginger in salt and water one night, and slice it; peel the garlic, slice it, salt for three days, and drain it dry; bruise the Tumeric, black pepper, and mustard, put all together into a jar, and pour the boiling vinegar over them. Keep the pickle for a month, and then put into it cucumbers, cauliflowers, or any other vegetable that has been previously salted." We have not tried this.

Toast.—How to Make it.

Did the reader ever ask for toast at a hotel? If so, he probably was served with a piece of fresh bread, burned before the fire, the charcoal mostly scraped off, and served under the name of toast. Now there is a little science involved in making toast. It should always be made of stale bread; the heat drives off whatever acids may have formed in the loaf, but more than that, the starch of the flour is more or less converted by the heat into a more digestible substance, dextrine. By nicely toasting a slice of bread we save the digestive organs a certain amount of labor; hence toast is usually acceptable to invalids and those of impaired digestion. So much for the philosophy of the thing; now for the practice. Make the toast from a stale home-made loaf. Bakers' bread will make an imitation of toast, but not the thing itself. Slice moderately thin, and place on the toasting fork, or in some of the wire toasters, and hold it near the fire until it is well warmed through. Then—here comes the rub—bring it near the fire where it will quickly become of a light brown, or rather of a deep golden yellow, turn and treat the other side the same, and serve. If buttered toast is desired, apply butter in moderate quantity while hot. Toast should not be piled upon a plate, as in that case the crispness is lost. If there is no toasting rack, lay the slices lapping over one another, shingle fashion, so that the moisture of the lower slices may escape, and not be absorbed by the others.

A Foot Rest.

In the "sanctum" of a friend we saw an odd looking piece of furniture, the use of which was not easy to conjecture. It consisted of two hardwood boards, each 16 inches long and 12 inches wide, put together as shown in the engraving, the horizontal piece being fastened 3 inches below the top of the upright one, and braced by semicircular pieces let in at the edges. It is not an easy matter

FOOT REST.

to warm or dry the feet by a stove, where the fire is at a distance from the floor, and the ordinary way is to rest them upon a chair. Our friend finds this rest to be much more comfortable and convenient, as it accommodates itself readily to any slight movement or change of the position of the body.

Fig. 1.—SCALLOP SHELL.

brings them in use for various kinds of ornamental work. The appearance of the shell is shown in figure 1, which represents one of medium size. For most ornamental purposes much smaller ones are used, while those sent to market are usually much larger. To see the animal in its greatest beauty it should be in an aquarium or other vessel of sea-water. When all is quiet it will open its shells as far as the connecting "mantle" will allow, and this will be seen to be studded with brilliant spots which glow like purple jewels. The scallops inhabit deep water, and during severe storms are thrown upon the beach in large numbers, where they may be picked up; but they are mostly taken by dredging in deep water. In the New York market they are rarely to be found in the shells, but in other sea-board cities it is common to find them so. The scallop, as seen out of the shell, is a short, white cylinder, and it puzzles many to see how this can be a "shell-fish." The only eatable portion is the large and strong muscle that holds the shell together. This is shown in figure 2, in place, one of the shells and all the rest of the animal being removed. This muscle corresponds to the one called the "eye," in the oyster, but it is much larger in proportion to the size of the animal, and it has a similar fibrous structure. It has a remarkably sweet taste, much like that of the flesh of crabs, and is highly relished by many, though not considered as particularly digestible.

Fig. 2.—EATABLE PORTION OF SCALLOP.

Scallops may be opened by placing them in a pot over a fire, and boiling them as directed for clams. When the shells open, the eatable portion is readily picked out, or they may be opened with a knife, and all but the part described rejected. Having shown which the eatable portion is, in speaking of the methods of cooking that part alone is referred

Mending a Rag Carpet.

Mrs. H. M. R., of Columbia Co., Pa., sends a number of suggestions in matters relating to economy in the household, of which we at present give the following: "One morning last winter as Henry took some hot coals out of the sitting-room stove to start a fire in the kitchen, he dropped nearly half of them on my new rag carpet, and burned seven or eight holes from one to two inches in diameter. At first I did not know what to do, but soon made up my mind to try to mend them, and I think I succeeded admirably, for when they were done they could not be seen half way across the room, and they would never be noticed by anyone unless his attention was called to it. I first cut both rags and warp out as far as they were the least bit tender with the heat, then went to the rag drawer and selected rags as near the color of those burned as possible, and carefully joined every rag burned with one of its own size and color. I was lucky enough to have yarn like the warp, for I made the carpet myself. Then I served the warp the same way, weaving it in the rags with a darning needle. It is rather difficult getting the warp just right, unless you know how. Begin by putting in every alternate thread; this brings them all over and under the same rags, the first going over. Then commence and put in those skipped, taking every other one left the first time over, and so on until all are in. It is better to pull some of the warp out a little further than it was burned, so that the knots may not all come in one place. This is easier done while the carpet is tacked on the floor than at any other time. It will be found rather trying work at first, but all that is necessary to accomplish it satisfactorily is a little patience and perseverance. Where there are many holes it is better not to try to mend more than one or two at a time. But I think it decidedly pays on a new carpet. Whether it will on an old one each one must judge for herself after she has tried it."

Economy in Coal Hods or Buckets.

Coal hods—called variously scuttles and buckets—will wear out, and the bottom is the place which first yields to wear and rust, this portion often failing when the rest is good. Mr. Frank Lee, of Ky., says: "My plan is: fit an oak board $1\frac{1}{4}$ inches thick in the rim of the bucket bottom, and nail it there through the rim. A bucket treated thus will last years longer than it otherwise would. If the wooden bottom should be put in when new, but if the bottom is broken and partly worn out it will do to put it in then. I have in use two buckets that became worthless, and I was about throwing them away when the idea occurred to try a wooden bottom, which I did, and they are now worth more than when I bought them."

More Variety in Food Wanted.

The farmer raises food for other people, but oftentimes does not enter wisely for himself. There is much just reflection upon farm life in that old miserly maxim first uttered as a sarcasm—"Sell what you can; what you cannot sell, eat; what you cannot eat, give to the pigs." We do not believe thrift lies in this direction. The producers of food are entitled to the best their farms afford, and in the long run this is the true economy. One secret of the strong drift of our farming population toward the city lies in the farmer's table. Children crave a variety of good, wholesome food, and enough of it, and any stint of it is certain to be remembered when they come to shift for themselves. The citizen always has a variety of food within his reach, and nothing but poverty prevents him from enjoying all that the farm sends to market. He has all the fruits and vegetables in their season, and in the best condition in which he can get them. He has fish and flesh in great variety, and his appetite is never cloyed. But upon the farm, where the best of every thing is produced, salted meats are too often the staple provisions the year round, and corn

meal cooked in some form is a perpetual feast. Now, there is no reason in the world why the farmer should not be the best fed man in the community. He ought to be, as an advertisement of his business. A tailor, of all men, cannot afford to dress shabbily. Coarse, ill-fitting boots are a bad card for a shoemaker. The producers of food should show us how to cook and enjoy it. Many farmers we know do give us this advertisement of their business. Their guests sometimes forget to come away, when their visits are finished. But this is a less evil than a hospitality which one is ashamed to offer, and which no one accepts a second time. The physical man should be kept in the best condition by a varied and generous diet, and the glory of the farm be made to culminate in the fine specimens of men and women it produces.

Sandwiches.

Francis Grosse, author of a dictionary of English local words, thus defines Sandwich: "Two pieces of bread and butter, with a thin slice of ham or other salt meat between them; said to have been a favorite dish with the Earl of Sandwich." Whatever great deeds the Earl may have done, his only recorded monument is two pieces of bread and butter with a slice of meat between them. The name, at all events, is enduring, but the monument disappears pretty rapidly, as every one likes sandwiches. They are in place at lunch, at tea, or at evening entertainments; they are most acceptable to travelers and hunters, and are good as a "bite" at any time when one is hungry. Sandwiches may be made off-hand, as they are eaten, or with more care, to be served at the table. For a hasty lunch, take two good slices of bread, well buttered, of a thickness proportioned to the appetite, and place between them slices of ham, tongue, corned or roast beef, or any other cold meat. Cold chicken or turkey, having a very thin bit of ham with it, makes a most excellent sandwich. The meat should always be cut very thin, and it is better to lay on several delicate slices than one thick one. Salt as required, and use mustard if it is liked. In putting up sandwiches for travelers, or hunters and fishermen, be generous, as they are apt to have consuming appetites. With sandwiches for the table, for parties, fairs, etc., more care should be used. For bread, a good, home-made loaf, baked in a square tin, will cut to the best advantage. It should be old enough to cut smoothly, and be sliced moderately thin with a sharp knife. Butter, and place the thinly cut slices of meat between; lay the sandwiches on a clean table, place a board on them, and press them just sufficiently to make them hold together; trim the edges square, stack on a plate, and cover with a damp napkin or cloth until served. Have the meat always very tender and thinly sliced, as it is exceedingly annoying to be obliged to "tug" at a sandwich. The best we have ever eaten were made of potted ham. The boiled ham is first chopped and then put into a wooden mortar and pounded until it becomes a smooth paste. This, spread upon a slice of bread and butter and covered with another, makes a sandwich more delicate than the Earl ever knew of.

Apple Pie as it Should Be.

A lady writes: "I have just been reading an article upon apples, written by George William Curtis. Speaking of apples and apple pie, he says: 'If you choose to slice and dry them,—it is not their natural end,—but even then they will return you good for evil in pies that might persuade any pagan to be a Christian. Not doughy, clammy, fatty pies, which are a device of Satan, but those triumphs which have no bottom crust, and in which the spoon sinks and sinks!—Schla!' "

For pies proper no condemnation can be severe enough. It is one of the alarming signs that we are getting to be a pie-eating nation. (Getting to be?) Pies are the staple food at all the taverns in the land. The rural kitchen is full of pies. The

railroad stations are piled with pies. The catting-booths in Fulton Market are lined with pies. It is the popular form of taking dyspepsia and ruining the health. The smart Sala, who hired himself to the London Telegraph to ridicule this country, sparkled when he wrote of pies; and the worst of his wit was that it was true. It is a prostitution of any fruit, an injury, a crime, to bury it in a pie. But against the venerable and august apple it is a peculiar infamy.—'Thus,' continues Mr. Curtis, 'nothing is so improper as a pie proper. But there are preparations called pie which are truly delightful; and chief among them that which slices the apple without making a mush of it, and after it slices it, spices it, and then bakes it under a firm, light, thoroughly browned, and dry crust.'

Now I do not agree with him in regard to all fruit being spoiled when put between two crusts, for pies made of rich preserve in this manner are delicious. But I do think with him that pies made of apple sauce might have originated from the source which he affirms. The manner of making the delightful pie to which he alludes is as follows: Take a deep dish, invert a teacup in the middle and slice around it some juicy, tart, high-flavored apples; then add a little water, sugar, and nutmeg, cover with a good, rich, light crust, and bake until nicely browned and the apples thoroughly cooked."

The Aetna.

The Aetna is an ingenious contrivance for heating liquids, or cooking small messes on short notice, without the trouble or expense of kindling a large fire. Two flanges are put on at the bottom of the vessel, as shown in the figure, the one to elevate it a little above the table on which it stands, and the

other, inverted, to make a gutter for the alcohol, which is the article used as fuel. The alcohol when lighted makes a blaze on all sides of the cup, and heats it very rapidly. A teaspoonful will warm a pint of beef tea sufficiently for drinking, or cook the same quantity of arrowroot or

other food. This vessel is a very great convenience in the sick room, especially in the warm months, when a fire is oppressive. It can be had at the furnishing stores, or any tin worker can readily make it. It should have a wooden handle.

CHILDREN'S SWINGS.—In a recent letter "Aunt Mattie" says: For a time we had only one swing, and the vexation and annoyance the one caused cannot be calculated. Every few minutes Willie would be in to complain that Lizzie had swung enough, and that it was his turn, or Lizzie would cry because Bobbie had it, or would not push, etc., etc., until finally Edward and I compromised the matter by having a swing made for each one, even the two-year-old baby being accommodated with a chair suspended securely to a branch of the tree. You would be astonished to see how differently things go under the new arrangement. Baby will swing by the hour, and often goes to sleep in his "little rock," as he calls it. I think a great deal of fretting and crying among children, and scolding among parents, too, might be prevented by the exercise of a little care and ingenuity.

THE HEALTH OF GOLD FISH.—These pets of the glass globe die early, like other beautiful things, as some of our fair correspondents complain. They are careful to change the water, and keep them clean, but forget that the carp is a voracious animal with a sharp appetite, and as much in danger of starving to death in his narrow quarters as a land animal. In confinement, however, it is best to give them animal food, such as worms, only occasionally, and let their principal fare be of pellets of stiff dough, made of flour and water only. Always remove all the food that remains uneaten.

BOYS & GIRLS' COLUMNS.

Fearful Convulsions.

A few months since we gave in the *American Agriculturist* a brief account of some of the most remarkable earthquakes on record, and the great destruction caused by them. The world has just been startled by reports of the greatest convulsion of this kind known in modern times; in some respects perhaps the most remarkable known to man. A district of country on the west coast of South America, 800 miles long, and from 200 to 300 miles wide, was shaken with fearful violence. Whole cities were thrown down in ruins, and thousands of the unfortunate inhabitants destroyed. In many places the earth opened, and smoke, steam, hot water or mud, were vomited forth in immense volumes. The force of the shock drove the waters of the Pacific away from the coast, and soon they came rolling back in an immense wave, fifty feet high, sweeping every thing before them. The Chincha Islands on the coast of Peru, from which the largest supplies of guano are derived, were entirely devastated by this fearful tide, and a great number of vessels were overwhelmed or wrecked on the shore. Recent accounts mention a startling phenomenon connected with the same great convulsion, now going on in Hawaii, one of the Sandwich Islands. This island, which covers an area of some 4,000 square miles, is apparently slowly settling into the sea, a change of several feet in the coast level having been noticed within a few months. These exhibitions of almost immeasurable power give some idea of the untold forces still at work within the earth, and which may yet entirely change its whole surface.

The Revolution in Spain.

Recent accounts from Europe inform us of a revolution in Spain, by which Isabella II, the reigning queen, has been deposed. The event is full of interest to the world, showing the advancement of right ideas of government. Instead of the people being the servants for the support and glorification of the monarch, the American idea of the people being sovereign and the government their servants is rapidly advancing. Queen Isabella II is the last of the Bourbon family, long noted as tyrannical and profligate monarchs. She was proclaimed queen in 1833, while only three years old. Until she became of age, the government was administered by the queen's mother, and afterward by General Espartero. By an ancient law no female could become sovereign, but Isabella's father, Ferdinand VII, had abolished the law by his simple proclamation, thus excluding his brother, Don Carlos, from his rightful succession to the throne. Don Carlos enlisted a large party in his favor, and for years waged civil war, known as the Carlist war, against the adherents of Isabella, but he was overpowered and driven from the country. Isabella was made reigning queen eleven months before she actually became of age. Her life has been marked by flagrant violations of right and even common decency. She was married to her cousin in 1846, but was notoriously unfaithful to him, and chose her favorite lovers as her prime ministers in the government. Fearful of rivalry, and lusted by her ministers, she drove her own mother, her sister, and brother-in-law from the country, and also a large number of the most distinguished nobles and officers. Her reign has been almost a constant scene of turbulence, anarchy, violence, and bloodshed. At last retribution has come, and her kingdom is lost; let us hope never to be disgraced by her restoration. It is yet undecided what form of government will be adopted there; some are in favor of a republic, but they are probably in a minority, and some other family may furnish a head for the burden of a crown for a while longer, until the people shall have been educated to obtain and enjoy complete political freedom. Progress in this direction is very rapid all over Europe, and a few years may make very surprising changes in all the existing governments, and thus add much to history.

A Squirrel Hunt.

A large number of young ladies were gathered in the parlor of a boarding academy in Massachusetts, after dinner, when a red squirrel ran into the room. In an instant all was confusion. Some screamed with fright and sprang upon chairs, others ran from the room, while others closed the doors that they might capture him. After chasing him a moment or two he suddenly disappeared, and could be found nowhere, neither could any possible place of escape be detected. Soon after, as the ladies gathered at the tea-table, and were about to commence the evening meal, one of them uttered a piercing shriek. On examination the squirrel was found snugly stowed away in the folds of her skirt at the waist.

Suggestive Biography.—A dilapidated individual was overheard saying to himself: "I began the world with nothing, and I have held my own ever since."

A Sun-power Engine.

Mr. Ericsson, the inventor, best known as the originator of the Monitor during the late war, has completed an engine to be driven by *sun* power. His apparatus has not yet been publicly described, but must partly consist of some arrangement for collecting the rays of the sun, as is done by a burning glass, and using the heat to make steam or expand air. It is estimated by him that the heat derived from the sunshine on a surface 10 feet square (100 square feet) equals one horse-power. If this be correct, then the sunshine upon a moderate sized barn would give power enough to drive the thrashing machine, thrash out all the grain, cut all the wood, pump all the water needed, and perhaps do most of the chores, besides warming the boys' fingers in cold weather, and boiling the pork for dinner. Seriously, it is not impossible that a large portion of the work heretofore done by engines burning wood and coal may be accomplished by the mere use of the sun's rays. In fact, the sun has already supplied power for all our steam engines. Its rays imparted power to the growing forests. In ages gone by forests were buried in the earth and changed to coal. When coal is burned, it gives out the power which was stored up in the wood, changing water to the steam which drives the engine and the machinery attached to it. So that, after all, Mr. Ericsson has not invented or discovered a new power, but gone to the sun, the fountain head, for it, instead of drawing it from the reserved stores already contained in the earth. If this new arrangement can be successfully applied, it will work wonderful changes. The boy may now be living who will yet harness his balloon to a sunbeam and explore the ocean of air above us.

a storm of ridicule, and it remains to be decided whether fashion is strong enough to prevail against common sense and wit combined.

New Puzzles to be Answered.

No. 330. *Enigma*.—A certain article seldom shines, yet gives more light than the sun. It can be bought for a few cents, yet when spread in a certain way, is worth thousands of dollars. It has made thousands happy, broken many hearts, been concerned in innumerable business transactions, preserved the peace of nations, and caused many wars. Whoever looks carefully will see it now before his eyes. What is it?

No. 331. *Illustrated Idios.*—A very sad fact.

Answers to Problems and Puzzles.

The following are answers to the puzzles, etc., in the October number, page 373. No. 326. *Metagram*.—Blow, Glow, Flow, Slow.... No. 327. *Law Question*.—Not guilty. By looking carefully you will see that Brown killed 13 *Books*, which certainly was not manslaughter.... No. 328. *Illustrated Idios.*—Laziness begins in cowbells and ends in chains.... No. 329. *Enigma*.—A pump. The following have sent in correct answers to puzzles. Samuel Freed, Frank Bryant, Hubert S. Hixon, H. J. Crist, J. A. King, J. Milton Snyder, H. Dameron, P. J. Unsted, W. L. Pettit, Minnie Bailey, "X. Y. Z.," Hattie E. Hawley.

Practical Questions in Arithmetic.

No. 1. How many pages of reading may be accomplished in ten years, by devoting one hour a day to it? Try the experiment a few days, young friends, not to see how much can be got over, but how much can be thoroughly read so as to be understood and the leading ideas remembered. When it is known how many pages can be thus mastered per hour, it will be easy to calculate how much will be accomplished in ten years. Perhaps in ciphering it out, the total will prove so important that some thoughtful boys and girls will take the hint and score the benefit of a valuable fund of information. Of course it is understood that instructive books, — travels, history, biography, works on natural science, etc., — shall be selected. No. 2.—What amount of self-control, real will-power, may be cultivated in ten years, by persistent and resolute self-denial, in some one particular, each day? The proper subjects to exercise in are those where one is in doubt whether they are right or best. Indulgence of the palate, of vanity, pride, and especially of anger, and its expressions, including all profanity, will give plenty of opportunities to exercise self-denial. Estimating by the rule given by the Wise Man, that "He who ruleth his spirit is better than he who taketh a city," ten years such practice would make a mighty man. It is a well-known fact in the lives of the great that self-mastery is the strongest element in mastering others.

Origin of the "Grecian Bend."

During a few months past the high fashionable world has given to the rest of mankind an exhibition of first class folly, called the "Grecian Bend." Our artist gives a pretty correct representation of an unfortunate female afflicted with it, and as he has been reading Darwin's works, he adds his ideas of how the curious monstrosity may have been brought about by "gradual development." It is one of the unexplainable mysteries how any one, with or without brains, could fancy the stoop and hump style to be graceful or attractive. It has justly provoked

(COPYRIGHT SECURED.)

AN UNEXPECTED COLLISION. — Drawn and Engraved for the American Agriculturist.

Here is trouble enough for the youngsters who were having such a grand ride with their four-goat team. Their handsome, well-trained animals have been set upon by a lot of untamed, ill-bred street goats, the harness is broken, and the pets are suffering severely from the cowardly attack. We can all sympathize with the plucky fellow who rushes to the rescue, and belabors the vicious brute with his tiny umbrella. What could have provoked such a fierce attack? We have seen something like it among boys. The well-dressed and well-behaved are disliked by the ragged and the vulgar, who do not enjoy seeing others have what they do not possess. This is the hateful spirit of envy, that would drag others down to one's own level. Instead of striving to rise to theirs. It is at the bottom of many of the quarrels and much of the mischief in the world. In a goat it may be less hateful, although even there it entitles the trespasser to a sound beating; but in a boy or girl, it is difficult to find any excuse for it. The best way to overcome it is by trying to bring one's self up to a desired position; this is praiseworthy ambition, one of the noblest motives that can inspire the soul.

Curious Work of Bees.

Some of the insects mentioned in the following account taken from Merry's Museum are very common in this country. Sharpen your eyes and spy them out while at work. "The poppy bee makes her nest in the ground, burrowing down about three inches. At the bottom she makes a large round hole, and lines it splendidly with the scarlet leaves of the wild poppy. She cuts and fits the pretty tapestry, till it is thick, and soft, and warm, then partly fills the cell with honey, lays an egg, folds down

the red blankets, and closes up the hole, so that it cannot be distinguished; and there, in its rosy cradle, with food to eat, and a safe nook to rest in, she leaves her baby bee to take care of itself. The leaf cutting bee makes her cells of green leaves, shaping them like thimbles. These little jars she half fills with rose colored paste of honey and pollen from thistles, lays her eggs, and covers the pots with round leaf lids that fit exactly. The mason bee makes its nest of mud or mortar. It looks like a bit of dirt sticking to a wall, but has little cells within. The mother bee does all the work, sticking little grains of sand and earth together with her own glue. The carpenter bee bores in posts, and makes its cells of sawdust and glue. The carding bees live in holes, among stones and roots, making nests of moss, lined with wax, to keep the wet out, with a long gallery by which to enter. They find a bit of moss, and several bees place themselves in a row, with their backs toward the nest; then the foremost lays hold of the moss and pulls it up with her jaws, and drives it with her fore feet under her body as far towards the nest as possible. The second does the same; and in this way heaps of prepared moss are got to the nest; others weave it into shape."

Agricultural Jokes.—It is desirable that farmers should increase the growth of useful plants, but it is poor policy to prop-a-gate with old rails and boards.—Although a man who attends sheep is properly called a shepherd, it does not follow that one who keeps cows is a coward, or that one who feds steers is a good steersman.—Knowledge is favorable to prosperity; even the swine will in most instances thrive best that nose the most.

Precision in Business.

Haney's Journal relates the following: On a certain Saturday night the clerks of the bank of England could not make the balance come out right by just one hundred pounds. This is a serious matter in that establishment—not the cash, but the discrepancy, however slight. An error in the balancing has been known to keep a delegation of clerks from each department at work sometimes through the whole night. A hne and cry therefore was made after this one hundred pounds, as if the old lady in Threadneedle street would be in the Gazette as an insolvent for the want of it. Luckily on the Sunday morning following, the clerk—in the middle of the sermon, perhaps—felt a suspicion of the truth dash through his mind quicker than a lightning flash. He told the chief cashier on Monday morning that perhaps the mistake might have occurred in packing some boxes of specie for the West Indies, which had been sent to Southampton for shipment. The suggestion was immediately acted upon. Here was a race—lightning against steam, and steam with a start of forty-eight hours. Instantly the wires asked if such a vessel had "left the harbor." "Just weighing anchor," was the reply. "Stop her," frantically shouted the telegraph. It was done. "Have up on deck certain boxes, marked so and so, and weigh them carefully." They were weighed; and one, the delinquent, was found heavier by one hundred sovereigns than it ought to be. "Let her go," says the telegraph. The West India folks were debited with one hundred pounds more, and the error was corrected by the help of lightning, without looking into the boxes, or delaying the sailing of the vessel an hour.

OUR YOUNG FOLKS:

THE BEST JUVENILE MAGAZINE IN THE COUNTRY.

What it Has Been.

Our YOUNG FOLKS has, from the appearance of the first number in January, 1893, maintained the highest rank among the Juvenile Magazines of the world. It has blended instruction and entertainment so as to make it a welcome visitor in many thousands of American homes, gladdening the young, and affording most efficient aid to parents in the instruction and healthy diversion of their children. Prominent Educators, distinguished Clergymen of all denominations, and the Press generally, have commended it in the highest terms. It is filled with attractive Stories, Sketches, and Poems, by writers whose names are a passport to the affections of all youthful readers; and it is profusely illustrated by the best American Artists. Full page Illustrations are given in every number. An ample Department of Evening Entertainment and Correspondence makes OUR YOUNG FOLKS a Household Delight.

The rich and attractive character of its literary contents is shown in the following partial statement of the writers and subjects represented in the four volumes already issued.

CONTINUED STORIES, by CHARLES DICKENS, MAYNARD REID, "OLIVER OPTIC," J. T. THORNBURGH, "CARLETON," MRS. A. D. T. WHITNEY, Dr. I. I. HAYES, ELLIOT KELLOOG, "GEORGE EAGEN."

SHORT STORIES AND BIOGRAPHICAL SKETCHES, by Mrs. H. B. STONE, Mrs. L. MARIA CROFT, Miss MARGARET TAYLOR, T. W. HIGGINS, BAYARD TAYLOR, Author of "Angel Children," Aunt Fanny, Mrs. A. M. DIAZ, MARY N. PRESCOTT, J. G. WHITTIER, Mrs. J. G. AUSTIN, HELEN C. WREES, E. STUART PHILIPS.

POEMS, by H. W. LONGFELLOW, J. G. WHITTIER, J. R. LOWELL, T. B. ALDRICH, LYNN LARCOM, ROSE TERRY, R. H. STODARD, KATE PUTNAM OSOOG, Mrs. ANNA M. WELLS, Mrs. HARRIET PRESCOTT SPOFFORD.

HISTORICAL, SCIENTIFIC AND OUT-DOOR PAPERS, by LUCRETIA P. HALE, J. H. A. BONE, CHARLES J. FOSTER, C. D. SMALLY, the Author of "Seven Little Sisters," the Author of "Ten Acres Enough."

TERMS OF OUR YOUNG FOLKS:—Single or Specimen number, 20 cents; Yearly subscription, \$2.00 in advance; Three copies, \$5.00; Five copies, \$8.00; Ten copies, \$15.00 and \$1.50 for each additional copy; Twenty copies, \$30.00, and a copy gratis to the person sending the Club, or Twenty-one copies for \$30.00.

What is said of it.

"Its contents include an attractive variety of contributions from experienced writers, who have already won distinction in other departments of literary labor, and who here show a happy faculty of catering to the tastes of youthful readers."—*N. Y. Tribune.*

"It is certainly the best magazine for young people now published in any land or language."—*Philadelphia Press.*

"We wish that we were young again, that we might have the full enjoyment of this charming periodical."—*Genesee Farmer.*

"No periodical for juvenile readers has been published within my knowledge, in this country or abroad, of nearly equal excellence for intellectual vigor and freshness, for variety and tact, for originality and good sense."—*Rev. F. D. HENNINGTON, D. D., Pastor Emmanuel (Episcopal) Church, Boston.*

"The children of my neighborhood express peculiar satisfaction in finding themselves treated in 'Our Young Folks' as reasonable beings, and addressed as such by the first masters of knowledge, wisdom, imagination and style."—*Rev. H. W. BELLOWS, D. D., Pastor All Souls' (Unitarian) Church, New York.*

"I have taken 'Our Young Folks' from the first issue. It is admirably adapted, in every respect, to its purpose."—*Rev. O. W. CLARK, Bishop Meth. Episc. Church.*

"The freshness, vigor, and variety of its pages will attract and charm young folks. Its simplicity and purity of style will refine and elevate their taste; while its high moral tone cannot fail to inspire noble thought and feeling."—*JOSEPH WHITE, Sec. Mass. Board of Education.*

"The whole community have to thank you for producing a magazine so well adapted to the class for which it is intended, and so elevating and refining in its influences."—*SAMUEL P. BATES, State Historian, Pa.*

"Our Young Folks' tried by the twofold test of interest and influence, is unquestionably the best juvenile magazine published in this country. It hits most happily the golden mean between childish insipidity and stale erudition, combining the most original, the sparkling and vivacious of youth with the wisdom of age."—*E. E. WAITE, State Sup't of Schools, Ohio.*

What it will have in 1899.

All the features which have made OUR YOUNG FOLKS so popular heretofore will be continued; while a more practical cast will be given to it, by which it will lose none of its attractive qualities, but be rendered even more instructive and useful than it has been. The following are some of the prominent features of the volume for 1899.

The principal SERIAL STORY will be contributed by Mr. T. B. ALDRICH. It is entitled "THE STORY OF BAD BOYS," and is by far the most complete and delightful. The temptations, trials, errors, failures, and final success of these boys are all touched upon in turn, and the story cannot fail to be both interesting and useful.

JAMES PARTON, the well-known and entertaining writer will contribute a number of sketches of biography and adventure from the lives of some of the most famous Navigators and Discoverers.

A series of papers upon *Familiar Science* will be furnished by an eminent writer. In these will be embodied descriptive accounts of many of the singular phenomena of the world about us, with the causes which lead to them.

Mr. J. T. TROWBRIDGE will describe some of the more important and interesting phases of human history, such as Glass-making, Ship-building, Watch-making, &c. **Declarations,** specially written for "OUR YOUNG FOLKS," will be contributed to several numbers by Rev. ELLIOT KELLOOG, Author of *Spiritism*, and *Infelix*. The first of these—"Resistant at the Altar," will appear early in the year.

Mr. ERIC SARGENT will contribute a number of entirely new **DIALOGUES**, adapted to School Exhibitions and private recitations.

Stories, Poems, and occasional articles upon *Science, Travel, Biography, and Manufactures*, will find a place in OUR YOUNG FOLKS, and with the large corps of Contributors who are already so well known to the readers of the Magazine, will be called into all such other writers as have something of the very best to offer.

THE CHILDREN'S OWN DEPARTMENTS.—"Round the Evening Lamp," and "Our Letter Box," will still be important sections of each monthly issue.

The above are only a few of the features which the Publishers of "OUR YOUNG FOLKS" will offer to its readers in the coming year. There are really no sensible or interesting everywhere felt in juvenile literature by parents and children, and it will be their constant endeavor to make "OUR YOUNG FOLKS" a means of instruction as well as entertainment.

Three copies, \$5.00; Five copies, \$8.00; Ten copies, \$15.00

TICKNOR AND FIELDS, Publishers, Boston.

The December and January numbers of the *Agriculturist* will contain, on this page, additional features and illustrations of OUR YOUNG FOLKS.

AMERICAN WALTHAM WATCHES,

In Solid Gold and Coin Silver Cases Only.

PRICES.

Coin Silver Hunting Watches, Gent's Size,\$17.00
Gold Hunting Watches, Gent's Size, 28.00
Gold Hunting Watches, Ladies' Size, 67.00
Sent to all parts of the country by express, with privilege to examine before paying.
Send for a Circular, and compare prices before purchasing elsewhere.

BENEDICT BROTHERS,

Keepers of the City Time,

171 Broadway, cor. Courtland-st., New York.

WALTHAM WATCHES.

For a few months past we have advertised the above Watches at extremely low prices, and the result has been most satisfactory. Our plan has been to sell the genuine WALTHAM WATCHES in Solid Gold and Coin Silver Cases only, and at a very small profit, giving the purchaser every opportunity of examination and comparison, and with the understanding that if the Watch does not prove satisfactory, it can be exchanged or the money refunded.

These Watches are, without exception, the most perfect specimens of the art ever produced in any country. Each and every part is made by machinery of the most delicate and elaborate construction.

Compared with foreign watches, they possess many advantages, excellent not only in principle and finish, but still more in their reliability as time-keepers. As an indication of the prices we submit the following:

Silver Hunting Watches, \$18.00
Gold Hunting Watches, 18 karat case, 80.00
Gold Hunting Watches, Ladies' size, 70.00

We often receive orders direct from our advertisement, and for that every one should send first for the descriptive price list, which explains all the different kinds, tells the weight and quality of the cases, and gives prices of each. This we will forward to any one on application, and it will be found very useful in making a selection.

Every Watch is warranted by special certificate from the American Watch Co.

We send them by express to any address, allow the purchaser to open the package and examine the Watch before paying, and if afterwards it does not prove satisfactory, it can be exchanged or the money will be cheerfully returned. Please state that you saw this in the *Agriculturist*.

Address, in full, HOWARD & CO.,

No. 619 BROADWAY, NEW YORK.

EARLY ROSE,

LOW, Send for Circular. Address J. H. FOSTER, Kirkwood, N. J., who grows 25 acres of Small Fruits.

CONTINENTAL LIFE INSURANCE CO. OF NEW YORK.

POLICIES ISSUED TO SEPT. 1, 1893, \$9,054.

INCOME OVER \$2,000,000.00.

JUSTUS LAWRENCE, PRESIDENT.
J. HILTON SCRIBNER, VICE-PRESIDENT.
J. P. ROGERS, SECRETARY.
R. C. FROST, ACTUARY.
E. D. WHEELER, M. D., MEDICAL EXAMINER.

PRINCE & COS.
OF NEW YORK.
AND MELODEONS.
43,000 now in use.
BUFFALO, N. Y. CHICAGO, ILL.

RELIABLE AND RESPONSIBLE AGENTS wanted in all parts of the country for the

Novelty \$25 Sewing Machine.

First class parties only are invited to correspond with

S. E. H. VANDYKE, Gen'l Agent,

615 Broadway, New York.

\$99 WILL BE PAID TO THE MEDICUM.
Chloroform, or ordinary mortal, who can read the Preface to BENNY C. WOOD'S New Series of the Poem, THE UPSHOT FAMILY. Sent for 25 cents. Bound in crimson and gold, 75 cents. HENRY C. WOOD, 615 Walnut-st., Philadelphia, Pa.

PENNA. STATE NORMAL SCHOOL, gives a thorough English education. Cheap, Systematic, Practical. Both sexes received. Address J. A. COOPER, Ellinboro, Pa.

RILEY'S EARLY RASPBERRY.—The earliest and best of all raspberries. Sent for 25 cents. Sent for (enclosing stamps) our "Manual of Grape and Small Fruit Culture." Address J. H. FOSTER, Kirkwood, N. J., who has the EARLY ROSE potato for sale here, and also a full stock of Small Fruits.

MOUNT LEBANON GRAPE.—A New and valuable variety. Send for our circular of Novelties, which gives history, description and testimonials. Oriented with the Society of Shakers, Mt. Lebanon, N. Y., and by them placed in our hands for propagation. Address H. FOSTER, Kirkwood, N. J. We have a complete stock of all Small Fruits. Send stamps for our "Manual of Grape and Small Fruit Culture."

PROSSER RASPBERRY.—Sometimes (but improperly) called Burlington. We rear it on stock genuine. It has all the necessary qualities to place it fully as high as the Clarke, which is the best of all raspberries. Send for our circular of Novelties. A full stock of all kinds of Small Fruits. Send stamps for our "Manual of Grape and Small Fruit Culture." Address J. H. FOSTER, Kirkwood, N. J.

WHITE CLUSTER BLACKBERRY.—A superb berry in all respects that can make up a standard fruit. Of a beautiful cream color. Perfectly hardy and vigorous. For history, description, and testimonials, send for our *Novelty Circular*. Address J. H. FOSTER, Kirkwood, N. J. Send stamps and get our *Novelty Manual of Grape and Small Fruit Culture*.

MUNSON'S COMPLETE PHONOGRAPHER.
One volume, 12mo, cloth. Price \$2.

"I received the COMPLETE PHONOGRAPHER on the 26th of April, and without teacher, or any previous knowledge of phonography, by devoting for a greater part of the time only one hour a day to the study, was able to report a sermon verbatim on the 12th of the following September." S. S. GILSON, Teacher of Theology at the Theological Seminary, Allegheny City, Penn.

Sent by mail, prepaid, on receipt of price.

OAKLEY & SARGENT, Publishers, New York.

WANTED.—Agents to sell the Lightning Trap. A new and wonderful invention. It kills Rats, Snakes, Gophers, &c., throws them away, and sets itself as quiet as its name indicates. Address LIGHTNING TRAP CO., 95 Mercer-st., New York.

EARLY ROSE POTATO.

Be Sure and Get the Genuine.

B. K. BLISS & SON,

Nos. 41 PARK ROW and 151

NASSAU ST., NEW YORK,

(LATE OFFICE OF AMERICAN
AGRICULTURIST.)

The above engraving is from a photograph taken from life of D. W. RAMSDALE, originator of the Norway Oats.

MORE TESTIMONIALS.

Light Street, Pa., Sept. 24, 1893.

I write to say that I am greatly pleased with the Norway Oats I received from you last spring. They yielded at the rate of sixty bushels to the acre, stood up well, straw good and heavy. Our common oats on same ground gave us only 30 to 35 bushels. My neighbors laughed at me for paying such a price for seed, but now the laugh is on the other side of the face. The season has been the poorest for oats I ever knew of. Send me a few of your printed histories of this grain, and I will distribute them willingly.

Truly Yours,

H. H. Brown.

W. H. Tyler, Guilford, Vermont, says:

The Norway Oats are a great improvement. They grew very heavy, with numerous stalks, and yield fifty three times as many as any oat we have ever raised in this section. I shall preserve all my seed for next season, and I am satisfied they will take the place of all others.

From J. B. Cloud, Union Village, N.

They are far superior to any I ever saw in every respect. No farmer can afford to raise any other kind if he can get this seed.

Oscar E. Sargent, Chesterfield, N. H., says:

Those Norway Oats recommend themselves to all who sow them growing. They are certainly a superior grain.

From J. C. Orne, Willoughby Lake, N.

The Norway Oats I had of you have proved to be as good as you represented them to be in every respect. They are far more profitable to raise, and all farmers will do well to procure them at the first opportunity.

From Wm. Hancock, South Barre, Vt.

Those Oats have done remarkably well. From the 100 seeds I had, it is estimated by my neighbors that I will have a yield of from six to eight quarts. They are regarded as a miracle by all who have seen them.

The Norway Oats have received the highest prize at many of the State and County Fairs throughout New England, and from the thousands of farmers who have grown them the past season, we have already received over one thousand letters of recommendation. Probably no improvement in the interest of agriculture has ever received such universal and hearty endorsement, as has been accorded to this grain. A full history will be mailed to all who desire it.

Farmers will be furnished with this seed until further notice, at the following rates:

One quart, post-paid.....	\$ 1.25
Two quarts.....	2.50
One peck, by express, charges to be paid on delivery.....	4.00
One half-bushel.....	6.00
One bushel.....	10.00
Two and one-half bushel bags.....	25.00

Sold by the standard of 32 lbs. to the bushel.

Remittances should be in checks, drafts, post office orders, or in money, by express or registered letters. In order, tag, give your post-office address, also state nearest express office, if to be sent by express.

As to our responsibility, we refer to the following well-known parties:

Messrs. HARPER & BROTHERS, New York.

G. COLLAMORE & CO., 731 Broadway, New York.

C. A. STEVENS & CO., 40 East 14th St., New York.

Write our address plainly on the envelope, and always put our box number on, as well as our place of business, as follows:

JONES & CLARK,
No. 20 Liberty Street, New York.
P. O. Box 5,699.

We offer for sale a fine stock of this valuable Potato, grown expressly for us from the original stock. The experience of the past season fully confirms all that we stated in favor of this variety when we first offered it for sale last spring. Well-ripened tubers have been exhibited, grown in eight weeks, in the open ground, and we have abundant testimony from many growers proving it to be *many times* to be *any other variety* of superior quality, and *enormously* productive, yielding from 400 to 500 bushels to the acre.

A Silver Medal has been awarded us by the Massachusetts Horticultural Society, and special prizes at various other State and County Agricultural Societies, which, with the many favorable reports received from our customers in various parts of the country, authorize us in recommending it as the *earliest*, *most productive*, and *best flavored* variety in cultivation. It is particularly recommended for culture in the Southern States, as new potatoes of this variety can be sent to the New York market as early as the more common varieties from Bermuda.

The following from a few of our correspondents will confirm what we have said.

Messrs. B. K. Bliss & Son—Gentlemen: I have this day tried on my own table, the Early Rose Potato. I find it to be of the first quality, and have no hesitation in pronouncing it one week or more earlier than the Goodrich Early, and quite as productive.

Messrs. B. K. Bliss & Son: The Early Rose Potatoes are dry, mealy, and of excellent flavor; in fact, the best early potato I have ever eaten, and I have tested most of the varieties for many years.

Messrs. B. K. Bliss & Son: I planted nearly a peck of Early Rose Potatoes this spring. They have fully answered my expectations, being large, fair, productive, early, and of good quality. I had no doubt of exact comparison with the Goodrich, but am satisfied that they are decidedly earlier.

One Pound, \$1. Three Pounds, \$3, by mail, post-paid. One Bushel, \$15.
One Peck, \$5. Half Bushel, \$8. One Barrel, \$40.—50 lbs. to the bushel, 165 lbs. to the barrel.

Cash to accompany the order. Price to the trade in larger quantities will be given upon application.

Caution.—In consequence of the great demand for this variety last spring, a spurious variety, which strongly resembles the Early Rose, is being supplied in its name. In every respect, was widely disseminated, and will doubtless be offered again this fall. Beware of spurious varieties.

In consequence of the danger from frost in spring, all potatoes designed for early planting should be ordered in the fall. Potatoes will be delivered at the Express Offices, Boats, or Railroad Depots in New York City free of charge.

We also have on hand a large stock of *Early Goodrich*, *Sweeten*, *Dykeman*, *Harison*, and other leading varieties, at lowest market prices, a Descriptive Priced List of which will be mailed to all applicants enclosing ten cents.

B. K. BLISS & SON, Box 5,712, P. O., New York City.

LILIUM AURATUM.

The Japanese Queen of Lilies.

We have a fine stock of this gorgeous Lily in splendid condition, many of which are of a larger size than any hitherto offered. A correspondent of the *London Times* has the following remarks regarding this, the most magnificent of modern floral introductions: "*Lilium auratum*—This golden-rayed Queen of Lilies is the most beautiful of the Lily family. It is perfectly hardy, and for the adornment of the Flower-garden, the Conservatory, and the Sitting-room, it is unrivalled. The whole English floral world, on its introduction, was jubilant with delight, hailing its advent as an astronomer would the discovery of a star of the first magnitude; and in every city, both in Europe and America, it has received ovations such as would have been dear to the heart of the most ambitious prima-donna or the most successful conquering hero."

Specimens were exhibited the past summer in England, 6 to 8 feet in height, with from 30 to 75 flowers. It is perfectly hardy—having stood out the past winter in Massachusetts, with a slight covering of straw. A beautiful two-page lithograph, colored true to nature, will be found in our new Bulb Catalogue—which will be mailed to all applicants enclosing ten cents.

Flowering roots securely mailed to any address upon receipt of price.

Extra size, \$3.00 each. No. 1, \$1.50 each; \$12 per dozen. No. 2, \$1.00 each; \$9.00 per dozen. A liberal discount to the trade.

B. K. BLISS & SON,

41 Park Row, & 151 Nassau-st., New York.
P. O. Address, Box 5,712 New York.

Early Rose Potatoes.

By mail, post-paid, without danger of being bruised, being carefully packed in

Wardwell's Patent Wooden Boxes. One pound, \$1; Three pounds, \$3. Having a good supply, we also send them without charge as premiums to those purchasing our garden seed in packets.

THE BEST IS THE CHEAPEST!

THE FALL CAMPAIGN OF MOORE'S

Rural New-Yorker, the Leading and Largest-Circulating Rural, LITERARY and FAMILY NEWSPAPER, commenced Oct. 3, and hence *Now is the Time to Subscribe!* Eight Large Double-Column Pages, Illustrated, with over a dozen distinct Departments, each ably conducted, the Best Talent being employed. Election will soon be over, when everybody, in both Town and Country, will want the most Progressive, Timely, Entertaining and Useful Weekly of its Class—MOORE'S RURAL. Vol. XX begins Jan. 2, 1893. Terms, \$1 a Year. The 13 Numbers of this Quarter (Oct. to Jan.) sent, *On Trial*, for Only FIFTY CENTS. Try the Trial Trip?

Address **D. D. T. MOORE,**
41 Park Row, New York, or Rochester, N. Y.

What Leading Journals Say.

The **RURAL NEW-YORKER**—one of the very best of our Agricultural weeklies—has opened an office in this city. (No. 41 Park Row), and will henceforth be published simultaneously here and at Rochester, its Editorial Mr. D. D. T. Moore, late Mayor of Rochester, has been nearly twenty years at its head, and has surrounded himself by a very able Corps of Assistants and Contributors. It is thus doing a noble work for Agriculture in the West, and is now rapidly enlarging the field of its usefulness.—*N. Y. Daily Tribune.*

MOORE'S RURAL is full of variety, original and select. We confess to a surprise at the variety and richness of its contents heartily illustrated as it is. No paper on our list comes so near our ideas of perfection, for a secular family paper. It maintains a high moral standard.—*New York Observer.*

The **RURAL** as a newspaper enterprise has no parallel. It now has a *great circulation by tens of thousands* than any other Weekly in the country, which gives prominence to agriculture and kindred branches of industry.—*Roch. Union.*

The **RURAL** is not only a favorite in the rural districts, but deservedly popular in the cities. No newspaper in any country ever ran a more prosperous career.—*Lancashire (Eng.) Journal.*

Without exception, the best Agricultural and Family Newspaper. Mr. Moore lately received a \$1000 draft for one club of new subscribers.—*Minneapolis Statesman.*

Remember the **RURAL** is not a MONTHLY of only 12 issues a year, but a Large and beautiful WEEKLY of 52 Numbers.

The Herald of Health Free.

Words from Over the Water.—

"We are glad to welcome, among our budget of monthlies, an American magazine, THE HERALD OF HEALTH. Let its own heading express its object. 'THE HERALD OF HEALTH AND JOURNAL OF PHYSIOLOGY.' It is the organ of a Higher Type of Manhood—physically, intellectually, and morally. It has quite as much claim to the title of a woman's magazine as the 'Victoria Magazine,' and is full of thoughtful, practical papers, pleasantly written—most of them by authors and authoresses of note—among whom we may mention the Rev. Henry Ward Beecher and Mrs. Horace Mann. Wives and housekeepers will find all some very useful hints in the pages of THE HERALD, and we recommend it as an excellent domestic magazine."—*Constitution, London.*

So says one of our London exchangers. \$2.00 a year; 20 cents a number. For \$3.00 we send it a year with a copy of Physical Perfection, a large, illustrated work of great value, worth \$2.00. For \$5.00 we send the **HERALD** and The New York Weekly Tribune one year for \$3.00. For \$10.00 we send the Agriculturalist one year. For 20 subscribers and \$50, we give a Wheeler & Wilson Sewing Machine, worth \$35. Those who subscribe now will get Oct., Nov., and Dec. Nos. free. Address MILLER, WOOD & CO., 15 Light-st., N. Y.

ANNOUNCEMENT!!

I take great pleasure in informing my friends and the public, that the business of All Nurseries in One, Whitlock's Horticultural Recorder and Exhibition Rooms, which I have heretofore conducted, has this day been turned into a Stock Company, under the Corporate name of

"The Whitlock Exposition and Exchange Company,"

with a capital amply sufficient for conducting the business on a scale corresponding with its rapidly growing demands. From the beginning the business has been a success. It has supplied a long felt and imperative want. It has been appreciated and liberally patronized by the public. The new arrangement will greatly increase its facilities for continued and enlarged success. The officers of the Company are as follows: L. L. WHITLOCK, President; J. A. CURTIS, Treasurer. The place and entire plan of business continues as heretofore, and the new corporation assume all its assets and liabilities.
L. L. WHITLOCK,
Oct. 5, 1893. 215 Broadway, New York.

DOTY'S WASHING MACHINE.

Lately much improved—and the new

UNIVERSAL CLOTHES WRINGER,

Improved with *Doty's Patent Double Conspirels*, and the *Patent Slop*, are now unquestionably far superior to any apparatus for washing clothes ever invented, and will save *four or twice a year*, by saving labor and clothes.

Those who have used them give testimony as follows:

"Doty's Washing Machine, which we have now used nearly four years, is the only one of the 'help' will use voluntarily."—*American Agriculturist* (October number).

"The Universal Clothes Wringer is a time-saving, strength-saving clothes-saving implement that should be in every family."—*American Agriculturist* (October number).

"We like our machine much; could not be persuaded to do without it, and with the aid of Doty, we feel that we are masters of the position."—*Rev. Bishop Scott, M. E. Church.*

"It is worth one dollar a week in my family."—*N. Y. Tribune.*

"In the Laundry of my house there is a perpetual thanksgiving on Mondays for the invention of your excellent wringer."—*Rev. Theodore L. Cuyler.*

"Every week has given it a stronger hold upon the affections of the inmates of the laundry."—*A. J. Oberster.*

"I heartily recommend it to economists of time, money and contentment."—*Rev. Dr. Bellows.*

PRICES.

Send the retail price, Washer, \$14, extra Wringer, \$9, and we will forward either or both machines, free of freight, to places where no one is selling; and so sure are we they will be liked, that we agree to refund the money if any one wishes to return the machines free of freight, after a month's trial according to directions.

Carriers with exclusive right of sale make money fast selling them.

Sold by dealers generally, to whom liberal discounts are made.

R. C. BROWNING, Gen. Agent,

33 Cortlandt-st., New York.

PATENT OFFICE

Inventors who wish to take out Letters Patent are advised to counsel with

MUNN & CO.
37 PARK ROW, N. Y.

PROPRIETORS OF THE SCIENTIFIC AMERICAN

who have prosecuted claims before the Patent Office for over Twenty Years.

Their **AMERICAN AND EUROPEAN PATENT AGENCY** is the most extensive in the world. Charges less than any other reliable agency. A Pamphlet containing full instructions to inventors, is sent gratis.

Send a handsome Bound Volume, containing 150 Mechanical engravings, and the United States Census by Counties, with Hints and Receipts for Mechanics, mailed on receipt of 25 cents. The **SCIENTIFIC AMERICAN** is the best and cheapest Weekly Technical Newspaper, devoted to Science, Art, and Mechanics, published in the world. Three dollars a year. Specimens gratis.

MUNN & CO., 37 Park Row, New York.

The Western Rural

TAKES THE LEAD in the Rural line—has the largest circulation in the West.—*Farmers' Union.*

Enclose \$3 to H. N. F. LEWIS, Publisher, Chicago, Ill., for The Western Rural, the Agricultural, Horticultural and Family Weekly, and the American Agriculturist, both one year (with tree copies to new subscribers for remainder of 1893). Regular price of both, separately, \$1 per year.

Or write for specimen copies (sent free) of The Western Rural, with full particulars of "EXTRAORDINARY PREMIUMS FOR ALL."

PARSONS & CO.

Offer in large quantities, and at reduced rates, by the hundred and thousand,

Camellia Japonica,

Of which their plants are bushy and healthy. The Double White is very largely grown, and the whole stock is worthy the attention of dealers.

Rhododendrons,

Which are well known as a special culture in their grounds, can be furnished by the hundred and thousand.

Roses,

In large variety, including the best sorts of Remontant Moss, Tea and China, can be furnished one and two years old, and at very low rates, by the thousand. It is unnecessary to recommend these to dealers, by most of whom their good quality is now well known.

Grape Vines

Have for some years been known as a specialty in this establishment. The stock is as large as usual, and special inducements can be offered to purchasers of IVES' SEEDLING, CORDON, 105A and DELAWARE.

Blackberries and Raspberries,

Including WILSON'S EARLY, KITTATINNY, CLARKE, ELLISDALE, and DAVISON'S THORNLESS, can be furnished at the lowest rates to those who wish to plant by the acre.

Chinese and Ghent Azaleas,

(Many New Shrubs.)

More than 200 Varieties of Rare

Conifers,

And all the new and well known

Planting.
Bedding.
Protection.
Bouquets.
Training.
Flower Gardens.
Lawns.
Flowering Shrubs.**

SENT POST-PAID, PRICE, \$1.75.

The Eumelan Grape.

This "Good-Black" grape is strictly like the best foreign kinds in its fruit, and fully equal to them, while in vigor and hardiness of vine it has during more than thirty years shown itself very remarkable, and unsurpassed among our most enduring natives—always ripening earlier than Hartford Profide. It is our only native kind that is able to take position by the side of the Iowa in quality, while it ripens two weeks earlier, and is more hardy and vigorous. We have had two American grapes that are fully satisfactory in quality, and equal to the best of the world, namely, Delaware and Iowa. The Eumelan makes the third. In purity, and rich, vinous spirit, it equals the Iowa—in honeyed aromatic sweetness, it exceeds it. See advertisement in *American Agriculturist*, page 38, October number. For full particulars, send stamp for Pamphlet, Price Lists, and Club-propositions. Delaware, Iowa, Israel, and other kinds, very cheap, and very good, for fall sale. Eumelan vines of surpassing quality, but the number limited.

C. W. GRANT,
Iona, near Peckskill, Westchester Co., N. Y.

GREAT INDUCEMENTS TO NURSERYMEN
AND PLANTERS, at O. F. BROWN'S NURSERY EXCHANGE, 251 Broadway, N. Y. Box 96, New York. Storms! Winds!

Rain! Snow!

Prepare for Winter!

Your Roof Leaks,

and your ceilings, furniture, &c., will be damaged to an extent of from \$2 to \$50.

It will cost you but a trifle to

Repair Your Roofs

with

Asbestos Cement

This Cement is prepared ready for use, of a proper consistency to be applied with a trowel. Owing to the peculiar nature of the indestructible fibrous mineral *Asbestos*, of which this article is made, it will not run or crack, but remains permanently where it is placed. It can be easily applied by any one, and is *absolutely* the best stop all leaks on roofs of all kinds, in connection, if required, with the

Asbestos Roof Coaling

an article of similar nature, prepared ready for use. It is applied with a brush, and will stop all small leaks which cannot be repaired in any other manner. Descriptive Circulars, Prices, and instructions for applying these materials by mail.

For sale by Hardware Dealers, and at Drug, Paint, and General Stores.

H. W. JOHNS, Sole Manufacturer,
THE AGRI-CULTURIST BUILDINGS ARE COVERED WITH THESE MATERIALS.

FLAX BRAKES.

Patented in Europe and America.

The best article in use. Break 2 to 5,000 pounds flax straw in 10 hours—requiring 65 to 75 per cent of woody matter. Will do the work better and faster than any other machine more than any other machine. Will break tangled and straight straw. A man and a boy, and one to two horse-power works them. Occupy about 5 feet square. Send for Circular.

JOHN W. QUINCY, 98 William-st., New York.

Improved Foot Lathes,

With Slide, Rest, and Fittings. Elegant, durable, cheap and will save the labor of the Artisan or Amateur Turner. Send for descriptive circular.

S. K. BALDWIN, Leicesters, N. H.

Sanford's Pat. Little Giant Horse Power

has been in use three years, and is the best. It is simple, durable, and compact. Weighs but 600 pounds, is easily loaded and moved by two men. Can be used with from one to four horses. Send for Circular. For sale by JOHN W. QUINCY, 98 William-st., New York.

DYE'S PATENT Stump Extractor & Building Remover.

Pronounced by competent judges and Agricultural Fairs to be superior to any other machine ever known or exhibited, for pulling Stumps, Trees, Rocks and Buildings. For further particulars and circulars, address

P. S. SCOVILL, Bordentown, N. J.

Drain Tile and Sewer Pipe.

Made by the Tiffany Tile Machine. Quality unequalled. CROSSMAN CLAY & MFG CO., Woodbridge, New Jersey.

Tiffany Tile Machines

Run out a continuous stream of superior Tile. Now in operation, and for sale at the works of the CROSSMAN CLAY & MFG CO., Woodbridge, New Jersey.

Sword's Brick Machine

For sale. Can be seen running at the works of CROSSMAN CLAY & MFG CO., Woodbridge, New Jersey.

MENEELY'S BELLS.

(Established in 1826.) Bells for Churches, Academies, Factories, etc., of which many have been made at this establishment than at all the other foundries in the country combined. Materials used, pure copper and tin. All Bells warranted. An Illustrated Catalogue sent free upon application to E. A. & G. H. MENEELY, West Troy, N. Y.

GUNS AND PISTOLS.

Whitney's Patent Double Bbl. Shot Gun, both muzzle-loading and breech-loading.—Whitney's Navy Revolver, 350-100 calibre, 7 1/2 inch Bbl.—Howard's Patent breech-loading Rifles and Shot Guns.—Excellent Patent breech-loading Rifle. All made of the best material, and in the most approved manner. Prices very low. Send for Circular or order samples.

WHITNEY ARMS CO., New Haven, Conn.

Winchester Repeating Rifles.

FIRING TWO SHOTS A SECOND AS A REPEATER, AND TWENTY SHOTS A MINUTE AS A SINGLE BREACH LOADER.

These powerful, accurate, and wonderfully effective weapons, carrying eighteen charges, which can be fired in nine seconds, are now ready for the market, and are for sale by all the responsible Gun Dealers throughout the country. For full information send for Circulars and Pamphlets to the

WINCHESTER REPEATING ARMS CO.,

New Haven, Conn.

THE COPPER STRIP FEED CUTTER.—If you want the cheapest, fastest, easiest working, and most durable Self-Feeding Hay, Straw, and Stalk Cutter, (not to be paid for till trials) send for Circulars to PECKSKILL PLOW WORKS, Peckskill, N. Y., or Cleveland, Ohio.

A DAVIS' IMPROVED AIR CYLINDER GRAINING MACHINE.

For Painters and Manufacturers; Graining and ornamenting in superior manner every kind of Wooden Ware, Cottage Furniture, Chairs, Collars, Bedsteads, Stairs, etc., 5-inch Machine, 6 different kinds of Bands, \$10. Every Machine warranted satisfactory. Terms net cash on delivery. Send stamp for full descriptive circular. Samples of the work may be seen at the salesroom of H. MURRAY & CO., 100 West 14th-st., N. Y.

HEATH, SMITH & CO., 100 West 14th-st., N. Y.

SWIFT'S PATENT FARM MILL for grinding feed for stock.

Efficient, durable, and low-priced. Send for Circular. LANE BROTHERS, Washington, N. Y.

Sample Rooms, 361 Pearl-st., New York.

The only Family Machine that sets up its own work, knits all sizes, widths and patterns, knits the best into the stocking, and narrows off the toe complete—producing all varieties of knit goods. It is simple, durable, easily operated, and warranted to succeed in the hands of every purchaser. Address with stamp for circular and sample stockings, JAS. D. O'NEIL, Gen'l Agent, 92 Chestnut-st., Philadelphia, Penna.

\$10 a Day for All—Stencil Tool Samples free. Address A. J. FULLAM, Springfield, Vt.

A First Class Organ for \$50.

The MASON & HAMLIN ORGAN CO., winners of seventy-five highest premiums, including the Paris Exposition Medal, for the best instrument of this class in the world, respectfully announce that their facilities are now so great that they undertake to furnish not only the best and cheapest, but the *lowest priced* first-class Organs obtainable, and they ask attention to their present scale of prices, of which the following are illustrations:

FOUR OCTAVE SINGLE REED PORTABLE ORGAN, solid Black Walnut Case, more powerful and much better than a Melodeon.....\$50.00
FOUR OCTAVE DOUBLE REED do. do. 75.00
METROPOLITAN ORGAN, STYLE C, FIVE OCTAVE, SINGLE REED, ONE STOP. (Tremulant). Solid Black Walnut Case, paneled and carved.....\$100.00
METROPOLITAN ORGAN, STYLE C, FIVE OCTAVE, DOUBLE REED, FIVE STOPS. (Viola, Diapason, Melodia, Flute and Tremulant). Solid Black Walnut Case, paneled and carved.....\$125.00
MASON & HAMLIN CABINET ORGAN, STYLE B, FIVE OCTAVE, DOUBLE REED, FIVE STOPS. (Viola, Diapason, Melodia, Flute, Vox Humana), including the new MASON & HAMLIN IMPROVED VOX HUMANA, just introduced, capable of a variety of exquisite effects. This is the *Best Organ of its capacity which we can make*; containing every improvement; these very best varieties of notes, and More than fifty other styles at corresponding prices, up to \$1,000 each. Every instrument fully warranted. Circulars with illustrations, full descriptions and prices free. Address THE MASON & HAMLIN ORGAN CO., 596 Broadway, New York, or 134 Tremont-st., BOSTON.

ASK YOUR GROCER

FOR TIEMAN'S LAUNDRY BLUE.

Small Fruit Plants in Variety.

It is not yet too late to send for a list of low prices of the best and most profitable varieties of Strawberries, Raspberries, Blackberries, Grapes, Currants, Asparagus, &c.

CHAS. COLLINS, Moorestown, N. J.

For Sale to Close the Estate.

The elegant Country Seat of the late *James V. Beach*, at *Waldenford, Conn.*, five acres land, garden, 1,500 choice fruit trees. 24 miles, 3 1/2 hours ride from New York, 12 miles, 35 minutes ride north of New Haven. For maps, plans, photographs, and full particulars, apply to either

JOHN M. MORGAN, 2 Pine-st., New York,
C. A. LINCOLN, 363 Main-st., Hartford, Ct.
GARDNER MOISE, 351 Chapel-st., New Haven, Ct.
or WM. V. BEACH, on the premises.

HORSFORD'S SELF-RISING BREAD PREPARATION.

PREPARATION makes the most wholesome and best of bread, biscuits, cakes, &c. Unlike some other yeast, it contains no POISON to cause DYSPEPSIA, and the bread may therefore be eaten with without detriment. Resolving into Phosphate of Lime and soda, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. "The Dough it does not, like other yeast, decompose flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains a full description of the use of the Preparation. Send to H. T. Love, No. 5 James Slip, New York, for "The Good Cook's Hand Book," for particular directions, to be sent you gratis, and for your share of the "Great Bread Preparation." JOHN DWIGHT & CO., Wholesale Agents, No. 11 Old Slip, New York.

HOUSEHOLD

CLOTHES

DRIER.

For families with young children, where infants or other clothing needs frequent washing and drying, or where inconvenient to use the old-fashioned clothes horse, is most useful and convenient. Occupies scarcely more room than a wash tub, when closed; open capacity, 21 feet. Hangs on the wall anywhere, put up or taken down in moments. Price \$2.00. Sole Manufacturer and Patentee, JOSHUA THORNLEY, Greenfield, Mass.

INGERSOLL'S COTTON AND WOOL PRESSES,

INGERSOLL'S HAY AND STRAW PRESSES, INGERSOLL'S RAG AND PAPEE PRESSES, INGERSOLL'S HIDE AND JIR PRESSES, BOTH HAND AND HORSE-POWER PRESSES, for baling all kinds of material, on hand and made to order. Also, a practical machine for sawing down timber. Price \$25. For price-list and information, send stamp to the manufacturers, INGERSOLL & DOUGHERTY, Greenpoint, (Brooklyn), N. Y.

"GET THE BEST."
The *Norfolk Job Printing Press*, for Circulators, Dragblasts, Merchants. Descriptive Circulars, and specimens of work mailed free. C. C. THURSTON & CO., Brooklyn, N. Y.

WILD GOOSE PLUM.—A limited number of the above trees can be furnished at the following prices: For single trees, \$1.00; per doz., \$9.00; per 100, \$90.00. Trees per dozen, \$1.00.
MANSON & WILLEY, Murfreesboro, Tenn.

Ives Seedling Vines.

The Great Premium Grape, with other varieties and Nursery Stock generally. *Grape Cuttings in quantity.* Send for the history of the Ives, & several of the Longwood Premiums, for the best grape for the whole country. Stock warranted. Price List freely. JAS. F. MARTIN, Box 113, Mt. Washington, Hamilton Co., Ohio.

NEW AND VALUABLE WORK.

HOW CROPS GROW.

A TREATISE

ON THE

Chemical Composition, Structure,
and Life of the Plant,

FOR ALL STUDENTS OF AGRICULTURE.

WITH NUMEROUS ILLUSTRATIONS AND TABLES
OF ANALYSES,

BY

SAMUEL W. JOHNSON, M. A.

PROFESSOR OF ANALYTICAL AND AGRICULTURAL CHEMISTRY IN YALE COLLEGE; CHEMIST TO THE CONN. STATE AGRICULTURAL SOCIETY; MEMBER OF THE NATIONAL ACADEMY OF SCIENCES.

This is a volume of nearly 400 pages, in which Agricultural Plants, or "Crops," are considered from three distinct, yet closely related, stand-points, as indicated by the descriptive title.

The Chemical Composition of the Plant

Is discussed in three Chapters.

1st.—*The Volatile Part.*

2d.—*The Ash—its Ingredients, their Distribution, Variation and Quantities. The Composition of the Ash of various Farm Crops, with full Tables; and the Functions of the Ash.*

3d.—*Composition of the Plant in various Stages of Growth, and the Relations subsisting among the Ingredients.*

The Structure of the Plant and the
Offices of its Organs

Is the subject of the Second Division, in which are discussed

The Primary Elements of Organic Structure.

The Vegetative Organs—Root, Stem, and Leaf, and their Functions; and

The Reproductive Organs, viz., Flowers and Fruit, and the Vitality of Seeds with their Influence on the Plants they produce.

The Life of the Plant

Forms the Third Division, under which are discussed the Phenomena of

Germination, and the conditions most favorable and unfavorable to it.

The Food of the Plant when independent of the Seed. Sap and its Motions, etc., etc.

THE APPENDIX, which consists of 12 Tables exhibiting the Composition of a great number of Plants viewed from many different stand-points, will be found of inestimable value to practical agriculturists, students, and theorists.

SENT POST-PAID.....PRICE \$1.50.

ORANGE JUDD & CO.,

245 Broadway, New York.

DARWIN'S NEW WORK.

THE VARIATION

OF

ANIMALS AND PLANTS

UNDER DOMESTICATION.

BY

CHARLES DARWIN, M.A., F.R.S., &c.

WITH A PREFACE

TO THE

AMERICAN EDITION

BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY.

IN TWO VOLUMES.

This work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, results of in-and-in breeding, crossing, etc.

It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: **PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS; FOWLS, DUCKS, GEESE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, BUD VARIATION. INHERITANCE, REVERSION OR ATAVISM, CROSSING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTER-BREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.**

Published in two Volumes of nearly 1100 pages.

FINELY ILLUSTRATED.

SENT POST-PAID.....PRICE \$6.00.

ORANGE JUDD & CO.,

245 Broadway, New York City.

A few of the notices by the Press, of Darwin's Great Work, *The Variation of Animals and Plants under Domestication*, are here given:

Mr. Darwin is not an ordinary writer, and has not been content to expand his earlier and more general statements. His recital of curious facts is enlivened and illustrated throughout by thought; his principles and arguments everywhere rest solidly upon observed fact.

The reader is frequently led up in thought, within sight and hearing, as it were, of the very workshop of Nature. Glimpes are given of wonderful prospects, passing suggestions of thoughts almost too bold for expression, or profound analogies are embodied in illustrations which might be expanded into theories.

Every chapter is full of facts. They are the substance of the whole work. No room is lost by the theories. They serve as a system for arranging the facts, of which the book seems to contain more than could possibly be compressed into the same space, if it contained nothing else.

Messrs. Judd & Co. have done justice to the work, and credit to themselves, by the elegance and accuracy of this reprint. It is as pleasant to read as the English edition, and more convenient to handle than that, which costs twice as much. [New York Evening Post.

While eminently valuable as contributions to science, these volumes will be found a source of much interest and instruction to the mere lover of nature. For example, in the case of the domestic pigeon, Mr. Darwin has described fully all the chief races, their history, the amount and nature of their differences, and the probable steps by which they have been formed. We have also the fullest discussion and information regarding domestic dogs and cats, horses and asses, pigs, cattle, sheep and goats. [Scottish American Journal.

Messrs. Orange Judd & Co. have laid the public under obligation by their prompt and handsome reprint of Darwin's last work. Whether the reader agrees or not with the peculiar views of the author upon the great problems involved, there can be no two opinions of the value of these volumes as a storehouse of the results of observations concerning our domestic animals and plants, far more elaborate and complete than can elsewhere be found. We can testify also that the work is a fascinating one for perusal.—[Congregationalist & Recorder, (Boston).

The publishers have done a great service to science in reproducing this most recent work of Darwin's in a handsome and, for so elaborate a work, a cheap form.

He (Darwin) goes where his facts lead him, and of these he has an immense, but intelligently arranged number; and has thus given to the breeder of animals, or the propagator of new varieties in the vegetable world, a treatise of great practical value, explaining all the laws of variation and selection that have thus far been definitely fixed. [Newark Advertiser.

It is a work which will command universal attention, and will be of particular value to agriculturists, whether engaged in stock-raising only, or in the cultivation of the soil in general.—[Pomeroy's (Phila.) Weekly Press.

The book presents the most remarkable collection of facts, methodically arranged, concerning our domestic animals and plants, yet brought together, and for this alone, it is of the highest value.—(St. Louis) Journal of Agriculture.

Whatever may be thought of Prof. Darwin's peculiar theories, there can be no doubt that his works form a large and important addition to human knowledge. In the present volumes his theory is connected with a vast variety of interesting and important facts, which have great practical value apart from the hypothesis they are brought forward to sustain.—[Boston Transcript.

The work is alike adapted to the wants of the practical agriculturist, and the student of natural history. The immense collection of facts which it presents in illustration of the scientific views of the writer, are of singular interest and value, irrespective of the peculiar theory of which he is the most able and earnest advocate, and in its present form, the original expounder.

Mr. Darwin's modesty is no less remarkable than his candor. He is an example of the humility which belongs to genuine science, and is the condition of high intellectual attainments. The execution of his work is in harmony with the characteristics of his mind. Written in a style of eminent simplicity, artlessness, and sincerity, free from abstruse reasonings or pedantic refinements, it must prove singularly attractive to the lovers of nature no less than to the scientific student. [New York Tribune.

NEW AND BEAUTIFUL WORK.

THE BOOK OF EVERGREENS.

BY
JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation, Description of Varieties and their Adaptability to Different Situations.

NOTICES BY THE PRESS:

A very complete and every way admirable treatise on the Coniferae, or cone-bearing plants, is *The Book of Evergreens*. Mr. Hoopes has devoted many years of labor and attention to the beautiful class of trees treated of, and his work, which is copiously illustrated, must at once become an authority. We shall be glad also, if it induces any to a closer study of trees, and to a further ornamentation of their houses with them. [Springfield Republican.

The value of this volume consists in its being both a labor of love and of duty. The author, having devoted a life to the study of trees and plants as a practical horticulturist, records here his views and experiences. Mr. Hoopes has studied all the treatises which bear on his subject, and availed himself of the assistance of many scientific friends, as well as recorded his own experience. The illustrations are numerous and excellent, and altogether the work has all the characteristics of an authority on the subject it so minutely and comprehensively treats.—[Boston Transcript.

It is a practical treatise on the Coniferae, or cone-bearing plants, describing them in all their families, and their best culture, management, and so forth, and is well illustrated. It fills a vacant niche, and every intelligent culturist of trees should have and use it. [Congregationalist & Recorder, (Boston).

The work was evidently prepared with great care and pains, and embodies the results of years of close observation and study. It is one of great value to the agriculturist and landscape gardener, and of special interest to all who care to know anything of the flora of the globe. To those who wish to raise trees, it is an indispensable hand-book.—[Liberal Christian.

It is undoubtedly the most complete American work of the kind in print. It is well illustrated and handsomely printed.—[Boston Journal.

We have examined this handsome book with a great deal of pleasure and satisfaction. The author has pursued a very desirable plan in his work, giving sufficient scientific information to meet the wants of the botanical student, and yet the work is sufficiently elementary in explaining terms and points about plant structure, and systems of classification,—in short, plain enough to meet the wants of every reader. It is printed in neat style, with thick covers and beveled edges, and a large number of very superior illustrations.—[Journal of Agriculture.

The work is now ready. 435 pp., 12mo, on fine paper. SENT POST-PAID, - - - PRICE \$3.50.

ORANGE JUDD & CO.,
245 Broadway, New York.

(Advertisements on this page, \$2.50 per Aline Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY RECEIVE THEIR TEAS BY THE CARGO FROM THE BEST TEA DISTRICTS of CHINA AND JAPAN, and sell them in quantities to suit customers AT CARGO PRICES.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American homes, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American home in China or Japan makes large profits on their sales or shipments—and some of the richest returned merchants in the country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 30 to 50 per cent in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells it to the Wholesale Tea Dealer in lots at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these EIGHT profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one centage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their tea at the same price (with the small additional expense of transportation) as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties getting Club or other orders for less than thirty dollars had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders will be forwarded by express, "to collect on delivery."

Hereafter we will send a complimentary package to the family getting the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for Clubs less than \$20.

Parties getting their Teas of us may confidently rely upon getting them pure and good, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OLONG (Black), 50c, 80c, 90c, best \$1.70 lb.
MIXED (Green and Black), 30c, 80c, 90c, best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c, 90c, \$1, \$1.10, best \$1.20 per pound.

IMPERIAL (Green), 80c, 90c, \$1, \$1.10, best \$1.25 per pound.
YOUTHFUL JAPAN (Green), 80c, 90c, \$1, \$1.10, best \$1.25 per pound.

UNOILED HIRON (Green), \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER (Green), \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUNDED COFFEE, 20c, 25c, 30c, 35c, best 40c, per pound.
Hotels, Saloons, Taverns, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant it to give perfect satisfaction. ROASTED (Unroasted), 20c, 30c, best 40c, per lb. GREEN (Unroasted), 30c, 35c, best 40c, per lb.

NOTICE OF THE PRESS.

From the American Agriculturist, N. Y. City.

"The Great American Tea Company," 31 and 33 Vesey-street, advertisement in our columns, though doing an immense business all over the country, has not even been complained of to us more than two or three times in as many years. On this account, as well as for other reasons we have previously stated, we believe general satisfaction is given to their customers. But stimulated by their success, several of the swindling fraternity have started or pretend to have started other "Tea Companies,"—some copying very nearly the advertisements, etc., of the old company. Some of these we know to be humbugs (one was noted last month) and as to others we have not evidence sufficient to warrant us in admitting their advertisements."

N. B.—INHABITANTS OF VILLAGES AND TOWNS WHERE A LARGE NUMBER RESIDE, BY CLUBBING TOGETHER, CAN REDUCE THE COST OF THEIR TEAS AND COFFEES ABOUT ONE-THIRD, (BESIDES THE EXPRESS CHARGES), BY SENDING DIRECTLY TO "THE GREAT AMERICAN TEA COMPANY."

Caution.—As some concerns, in this city and other places, imitate our name and style of advertising and doing business, it is important that our friends should be very careful to write our address in full, and also to put on the number of our Post-Office Box, as appears in this advertisement. This will prevent their orders from getting into the hands of these bogus imitators.

POST-OFFICE orders and Drafts, make payable to the order of "The Great American Tea Company." Direct letters and orders (as below, no more, no less).

Great American Tea Company,
Nos. 31 and 33 VESSEY-ST.,
Post-Office Box, 5,613, New York City.

The Cincinnati Weekly Times,

THE FAVORITE FAMILY NEWSPAPER OF THE WEST, having a bona-fide circulation of over 65,000. Has just entered its 26th Year, in an Enlarged and Improved Form, making it, without doubt, one of the Handsomest, Cheapest, and best Newspapers in the Union.

The extraordinary popularity of this Journal is attributed to the fact that it contains a great variety of Reading Matter suitable for

The Fire Side, The Counting Room, and the Work Shop.

A few reasons can be given why every person in want of a first-class Journal for the FAMILY CIRCLE, should subscribe for the Weekly Times:

1st.—Although decidedly Union and Republican in politics, yet it is subject to no oblique attacks, and will criticize, without fear or favor, the actions of both political parties.

2d.—Its entire ADAPTNESS TO THE FAMILY CIRCLE, through its instructive and entertaining stories, Lectures, Poems, Lectures,—its Household, Agricultural, Juvenile, Religious, and Miscellaneous Departments.

3d.—Its general intelligence, late news, and excellent original and selected matter, make it desirable in any reading community.

4th.—Its careful study of the AGRICULTURAL INTERESTS, and its desire to promote the good of the Farmer by giving him the experience of others, together with such information as will tend to his mental improvement and pecuniary advantage.

5th.—The entire absence of anything immoral in its columns, or in the least calculated to exert an unwholesome influence, in the young mind, and which can be found in many of the sensational weeklies now flooding the country.

6th.—It has strong friends especially among the adherents of all political parties, because it speaks plainly, honestly, and to the point, on all the leading questions of the day.

7th.—It is a Journal that can be recommended as being suitable for the Merchant, Farmer or Mechanic, to the Home Circle, the Counting Room and the Work Shop.

8th.—It contains an immense amount of choice reading, and has NEW YEAR DAY ADVERTISEMENTS.

9th.—Its REVIEW of the CINCINNATI and other leading markets of the Union, besides its Monetary News, its late Telegraphic intelligence, &c., &c.

10th.—And finally, for Completeness in all its Departments, it certainly has no superior in the United States as a Family Journal.

A Present to Every Subscriber!

The Union Hand Book and Family Diary for 1869.

This New Feature, recently introduced, and which gave such universal satisfaction to our Sixty-five Thousand Subscribers last year, will be continued this year.

As complete and interesting as our patrons pronounced the Hand Book for 1868 to be, the one for 1869 will be greatly superior. In addition to its being BEAUTIFULLY ILLUSTRATED, we propose to make several additions to it, which will render it still more complete and valuable. It will contain one hundred articles on important subjects, which Statistical Tables have been prepared with the greatest care, and the different departments will prove to be of great interest to the Family. The new Engraving of "The Giant Trees of California" will be sent to those who prefer it to the Hand Book.

Over Ten Thousand Testimonials

Have been given in favor of the Union Hand Book, a few of which only we have room for; wherever an opinion has been expressed as to its merits, it has been complimentary and decided, and no premium equal to it has since been issued.

JOHN MALONE, Danbury, Ct.—"Your Hand Book is liked by all, and is worth half the money the Times costs itself!"

A. M. DAWSON, Calcutta, Cal.—"I think I can send the club for the Weekly Times to the Hand Book appears to please the folks very much."

TERR, SKILLEN, Boston, Ct.—"The Hand Book came all right. It is everything you claim for it, and will greatly assist me in getting subscribers."

CARVER MORRIS, Ithaca, Ind.—"Your Union Hand Book gives every thing the people want. All say, the book is alone worth the money."

R. R. ARNOLD, Lester, Ill.—"As for the Union Hand Book, I can only say that it is a very valuable work. It contains good advice and instruction for all people."

J. M. HILL, Greenup Co., Ky.—"I will just state that the Hand Book gives universal satisfaction. The subscribers are well pleased."

W. J. KERR, Tusculum, Pa.—"It truly named, the Hand Book for there is scarcely a subject but on which it may be consulted with profit."

W. S. ENYER, Dallas, Pa.—"The Hand Book is a perfect success. Nearly all who saw them at the office wanted to buy one."

J. H. KINGSMAN, Colman, Wis.—"All parties are very much pleased with the Union Hand Book. I would not begin to take the subscription price for my copy."

H. S. BUTLER, DeWitt, Iowa.—"The Union Hand Book is the very thing that every person wants. I could have sold the one you sent me for one dollar three or four times; but it is not for sale."

TERMS: { Single Subscriptions, \$2.00 per year.
Clubs of Ten, 1.50 each.

FAN-TAILS.

GROUP OF FANCY PIGEONS.—Drawn and Engraved for the American Agriculturist.

In the April number is a picture of pigeons of very dissimilar forms. Those represented in the above engraving are most interesting for their variations in plumage. The *Fan-tail* stands entirely alone in its singular beauty. The tail is constantly expanded, the will of the bird influencing it but a little. In the best specimens there are upwards of 28 feathers in the tail, and 36 to 40 feathers are not unusual among high-bred birds. *Jacobins* are small pigeons, with the feathers of the neck so ruffled and reflected forwards as to give the

appearance of a monk's cowl partly thrown back. *Swallows* have the wings, the upper mandibles of the bills, and the feathers of the feet, dark, and the rest of the plumage white. Some have a white hood, or "turn-crown." *Nons* are remarkable for the brilliant contrasts of color, the head and throat, with the wings and tail, being black, while the rest of the plumage is brilliantly white. Some kinds are distinguished by a tuft, or turn-crown, rising like a shell at the back of the head. *Trumpeters* are good-sized pigeons, of various colors, having a

shell-like turn-crown, a rosette on the top of the head, and extravagantly feathered feet. The voice is peculiar, the coo being prolonged, making the name appropriate. The *Letz* resembles the foregoing in plumage somewhat, but does not trumpet. *Priests* are of different colors; black ones, with white heads and white wing-bars, are highly prized. The *Tumblers*, among the most interesting of fancy pigeons, turn summersets on the wing; one kind is marked by snow-white throat-feathers, called the *beard*; others differ in characteristics and plumage.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrolyte plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 16 to Vol. 26, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, DECEMBER, 1868.

Winter is here! short days grow shorter, cold ones colder. We seek our pleasures indoors, as a rule, and our labors, as farmers, are chiefly those incident to the season, and wherever performed, have only an indirect reference to the soil. Long evenings invite to reading and study; to the laying out maps of the farm, and plans of the labors to be undertaken next summer; of improvements to be set on foot upon the homestead, or for benefitting the public. They offer also an invaluable opportunity for looking over the labors of the past year, going over the accounts, taking an inventory of stock and property of all sorts. The farmer has a multitude of subjects to interest himself in, and it is worth a great deal to any young farmer to take up some one specially, and devote himself so thoroughly to it that his knowledge upon it will be far in advance of his neighbors'. For instance a young man may take up sheep and wool, and find in them material for a lifetime of study and experiment, and the more he knows of what other people have done and thought, the more profitable will he be able to make his own knowledge. Almost every department of farming offers similar subjects. Breeding, and feeding for milk, swine, poultry of various kinds, fish culture, and forest tree culture, are some very attractive objects of study, and a score might easily be named. There is no surer or pleasanter road to fame, and to the real respect and honor of the best men in the country than that by which a man becomes an "authority" on any important subject connected with Agriculture.

Farmers' Clubs.—If one is not in active operation in the neighborhood, it will pay to start one in most genuine farming communities. One good active young man, who knows what he wants, will generally do the work, and the whole burden of keeping up the interest will have to be sustained by half a dozen people. Hence such an undertaking goes easier and takes better if connected with some social entertainment at which the wives and daughters of the farmers may be present, or if coupled with a circulating library of books and periodicals, and with a system of exchange and distribution of choice seeds, that more may take a personal interest in it, and in having the meetings well attended.

The year now drawing to a close has been remarkable for unusually prolonged and severe cold, extending far to the southward, and doing considerable damage to some fruits, especially to the peach, blackberry, and raspberry crops, now of so much importance; for an exceedingly late and cold spring especially delaying farm work, which is usually done in May and pushing it into June; for a late, but, on the whole, propitious summer, causing crops to mature in a very short time, and giving us fair harvests of the great staple crops, and a very large yield of grass and hay. The prevalent character of the summer was, however, cold and wet over a large portion of the Union, and it has been the almost universal observation that so many weeds were never seen before. This entails additional labor upon all tillers of the soil for the coming year. The time of ripening for our cereal, Indian corn, was by the nature of the season very short, and though the summer was cold, frosts came so early as to seriously damage the crop of both grain and fodder in numerous districts. The same cause, early frosts, also blasted the prospects of an unusually favorable grape crop. The prices of agricultural produce have ruled very high, as indeed they have for several years past, and we may rejoice (not without the fear that this favorable state of things will not last), that the farmers are about as well paid as other classes of producers. The partial failure of the hay and root crops of Europe has led to the exportation, to some extent, of these articles. A remarkable and fatal murrain has been observed among our market cattle, originating among Texas droves, but affecting those chiefly which follow or associate with them.

The agriculture of the Southern States is gradu-

ally improving, and the great labor problem is undergoing solution. A condition of political anarchy is not favorable to agricultural development; nevertheless, men must be fed and clothed, and as both food and clothing are derived directly or indirectly from the field, man's necessities force upon him attention to the farming interests. We may continue to hope, therefore, that the magnificent resources of this section of the Union will before long be thoroughly developed.

Hints about Work.

Buildings.—Protect cellars against the frost, by banking up earth against exposed and thin foundation walls. Stop windows, except well-glazed ones, with straw litter, protected by stakes on the outside, to prevent lens scratching it all about. Pumps, cisterns, hydrants, and water-pipes need similar protection if exposed. Horse manure and litter is better than any other packing we know of to keep frost out of water-pipes. It is a good thing to line stables which are against the sides of old buildings, with strips of board tacked on so that swamp hay or straw can be stuffed in between them and the weather-boarding. It makes them much warmer, and saves fodder in proportion.

Ventilation.—Close stables may be warm, but without ample provision for ventilation they will be unhealthy. The stock will be found "off their feed," and ailing in various ways. With sufficient ventilation, which is easily secured, warmth and healthfulness are entirely compatible.

Chaffing, Soaking, Steaming Fodder.—The economy of the chaffing-box is very generally admitted nowadays, and with chaffing hay, and straw, and stalks, comes soaking as a matter of course. The expense of steaming fodder leads many of us who do not feel as if we could afford a Prindle's steam boiler, to devise cow-grape reasons why we and our cattle are just as well off without, while, nevertheless, all who do use steam are loud in praise of its economy. We have not come to grinding hay yet, but that will be the next step, in all probability, for its advantages have been asserted in Europe.

Roots.—Feed sliced, chopped, or mashed, in such pieces that a cow or "young critter" will not choke itself. It is rarely best to feed more than 4 quarts of carrots a day. Their highest effect is observed when fed with other roots, grain, &c. Common turnips are the first roots to be fed, as they soon grow pithy and lose much in value.

Foddering.—If any reader of the *Agriculturist* continues the wasteful practice of foddering upon the ground around stacks or in the barn-yard, we cannot him to stop it. Put up temporary racks, under cover if possible, and check this great waste.

Live Stock of all kinds should be looked to daily; they should be fed and watered with the regularity of clock-work. The earl, brush, and curry-comb will, if frequently used, not only promote health and cleanliness, but effect a great saving of fodder, while at the same time the paradox of sharpened appetites will be observed. A well-cleaned ox, whose skin has its pores thoroughly opened twice a week by the friction of the brush and card, feels well, and will eat coarser fodder with a better relish than an uncleaned one, and eat it cleaner, and it will do him more good. All kinds of stock should have salt before them, so that their natural craving may be satisfied. Salt and ashes are a good mixture, and a few sods, thrown where animals can work them over, will be mumbled and chewed off with a relish which makes it evident that it is no unnatural appetite, but that they get something which the pastures would supply in summer, and which their systems need equally in the winter.

Cows.—Do not dry off for the mere sake of saving labor. It is injurious to the milking qualities of both the cows and their female offspring. The milk-giving tendency should be encouraged to the utmost if milk is an object with the breeder. Feed well, whether cows are in milk or dry.

Green, if worked, should be kept sharp-shod, and **Young Stock** should be maintained constantly green, and not exposed to the weather, if simply

for the sake of economy of fodder and in the production of manure. We have repeatedly said, pine lumber is a great deal cheaper than hay as a means of warming stock, for fodder is little besides fuel, to maintain the internal heat in exposed animals.

Horses.—We do not believe in keeping horses as warm as other stock in the winter. Always rub down and blanket one that comes in wet or tired. Never expose a horse to drafts of air, or let him stand in the wind, if it can be helped, and if obliged to leave horses in the wind always blanket them. In the stable, pull off the blanket soon after a horse is cooled off. A horse ought to have a good portion of hay daily. High feeding without it gives him a neater barrel, but it is unnatural diet, and of course less healthful. The good grooming and regular care and exercise of city horses, and those fed in the same way, make good in a measure the defects of this diet, while farmers' horses, that live on dry hay and corn stalks the winter through, and are only brushed off a little, to get the hay seed out of their foretops, Sundays, remain healthy (if they do) on account of their more natural fare.

Swine.—As a rule, kill family pork when the weather becomes cold enough. It requires so much more feed to make a pound of pork in cold weather than when it is mild, that it will not pay to continue the fattening. Market hogs, if they have warm quarters, may be held for a short time if the markets are crowded, but it generally pays better to hold pork for a few days rather than swine, if the weather be cold, so that it will keep well.

Sheep.—Feed so as to keep them gaining; if fattening, feed pretty freely, being careful that none get too much, and none too little grain. A sheep overfed a few days is apt to get seriously off its feed and run back so that it will hardly recover its former stand all winter. Litter the yards freely.

Work in the Horticultural Departments.

By the Almanac, this month closes the year. To the horticulturist there is no such abrupt division of time; each month is linked with that which preceded it, and with that which shall follow, and at present he is much more inclined to look forwards than backwards. It is always well to look back a month or two and see if our notes do not suggest something that has been left undone—or forward a month, which will require turning to last January's number, to find if matters are not indicated there which can be more favorably done now than at any other time. While we would not disregard the lessons of our successes or our failures, we mainly look towards the New Year in our plans for work. Snows and bad weather stop out-of-door labor, and we congratulate ourselves that at this season there is time to read, and think, and discuss.

Orchard and Nursery.

Wherever the condition of the soil will allow, manure, plow, and subsoil, and prepare for planting.

Heeled-in Trees should be made all safe for winter. If there is any danger of water settling around the roots, make a ditch to carry it off, and if, in the hurry of heeling-in, the roots were not thoroughly covered, bank them up well with earth. Put no straw or other litter over the limbs, to harbor mice.

Domestic Animals often do much damage to trees, especially young ones. Good fences and well-closed gates are a preventive against these, as well as those human vandals who think it their right to disregard roads when there is snow on the ground.

Mice.—Various devices have been given to keep off these vermin—wrapping the tree with cloth or tarred paper, or surrounding it by a cylinder of tin, sheet iron, or two horse-shoe tiles, and putting a mound of earth around the tree about a foot high. If the soil of the orchard is light, clay or stiff loam is sometimes carted on for the purpose. Clear away weeds and litter of all kinds from around the tree, and if the earth protection is used, trample the snow hard after each fall.

Rabbits.—Use traps and guns. Sprinkling the

trees with blood is said to be effectual, as is the above-mentioned use of tarred paper. Laths bound on with annealed wire are also used.

Water should not stand upon the surface; open ditches to let off such accumulations.

Old Orchards are better pruned in winter than to be neglected altogether. Old and decaying limbs are to be cut out altogether, as well as those that crowd one another. Others are to be headed back to get a new growth. Where large cuts are made they should be covered with melted grafting wax.

Cions, for root-grafting this winter, or stock-grafting in the spring, may be cut wherever the wood is not frozen. Label carefully after tying in convenient bundles. Sawdust is the best material for packing. Where there are but few they will keep well in a close tin box, or tight glass jar, with no packing, if kept in a cellar or other cool place.

Manure may be applied to the orchard. Good rich compost is the best. Long or littersy manure should never be put near small trees, to harbor mice.

Frail.—Watch that in the fruit room or cellar, and as its period of ripening approaches, bring it into a warm room to finish the process. Send off fruit to market before softening begins.

Root-grafting may occupy the time when out-door work cannot be done. It is best to work at but one variety at a time, to avoid mixing.

What to Plant may well be considered in time. Get all possible neighborhood experience. During the winter, especially at the West, there will be numerous pomological meetings; attend these, if possible, hear discussions, see fruits, and talk with fruit growers. Read works on pomology, and be able to make an intelligent selection of fruits for spring planting, for home use, or for marketing.

Labels.—A good stock of these should be made during the winter months,—some notched to receive a wire by which to fasten them to trees, and others pointed at one end to enter the earth. Have one side, at least, smooth. Fine will last one season in the ground; if desired for a longer time, use cedar. Smear the place to be written on with white lead paint or linseed oil, and write with a soft pencil.

Fruit Garden.

The care of trees in the fruit garden is the same as mentioned for young trees in the orchard.

Bush and Pyramid Trees must not be allowed to become injured by accumulations of snow.

Protection is to be given to all plants requiring it. Raspberries of the tender sorts are to be covered with earth, as are grape vines where protection is needed. Cover the earth around strawberry plants, but do not cover the plants themselves too heavily. Straw, bog-hay, or corn-stalks are used for this purpose, and when it can be obtained, "Pine straw," or fallen pine leaves, answers.

Grape Vines.—Finish up the pruning in mild weather. Save snub wood as is needed for propagation. See last month's notes on pruning.

Kitchen Garden.

Crops that have been harvested should be looked after and made secure, and roots, celery, etc., in pits and trenches have a covering proportioned to the severity of the weather.

Parsnips, Horseradish, and Salsify.—A good portion of the crop of these is usually left in the ground, to be dug in early spring or during mild spells in the winter. By covering the beds with litter the freezing up may be postponed, and the season of digging prolonged.

Spinach, Kale, Leeks, and other crops left in the ground in northern localities need a covering of straw, leaves, or some other similar matter.

Cabbages.—Cover the inserted heads with earth, if not already done. The earth should be about six inches deep over the heads, and the edges pointed and smoothed with a spade so as to shed rain.

Cold Frames must not on mild days be allowed to become hot frames. There will be but few days on which the plants will not need air, and many on which the sash may be kept off until night.

Tools.—Many conveniences of the garden may be made during the winter. Arrange for a tool-house in some convenient place, if there is not one already.

Manure is the gardener's main care in winter. Every town and village allows valuable fertilizers to go to waste, as does almost every farm. Have an eye to the various factories, breweries, and the like, in the neighborhood, and see what their waste products are. It often happens that good fertilizers may be had for the expense of carting.

Seeds.—If any are not put away, thrash or rub out, label, and put in a safe place. Overhaul old stock, and keep none, the vitality or identity of which is doubtful. Those who purchase largely should be prepared to order early, as some kinds, seedsman inform us, are likely to be very scarce.

Flower Garden and Lawn.

There is usually more or less clearing up to be done of the remains of those vines and herbaceous plants which, after a long struggle, have at last yielded to heavy frosts. Take timely care of

Trellises, and all supports of a movable character. They should be put under cover, and permanent ones repaired and painted, if they require it.

Bulb Beds, whether new or old, if not already covered, should be protected by coarse manure.

Protection, with a covering of earth, will enable many half-hardy Roses, Wistarias, etc., to winter safely much further north than they would if left exposed upon the trellises.

Herbaceous Perennials, such as Peonies, Phloxes, Dicentras, and the like, come out all the better in spring for a forkful of manure as a winter blanket.

Half-hardy Shrubs, deciduous as well as evergreen, do much better with some cedar boughs tied or stuck around them, than in the old way of bundling them in straw, and with less trouble.

Snow will often break down or bend out of shape evergreens and dense masses of shrubbery. Shake out the snow before it becomes lay.

Rustic Work affords pleasant occupation for the winter. Seats for the garden should be solid and substantial. Vases and baskets ought to display taste without being painfully elaborate in design.

Cold Frames, in which Roses, Verbenas, and other half-hardy plants are stored for the winter, will need careful management. These plants will endure a low temperature, and even a slight freezing, provided they are perfectly dormant. Endeavor to preserve an uniformly low temperature, by airing by day and covering at night.

Chrysanthemums that have been potted for house-blooming should be cut back when they have passed out of flower, and the pots stored in a cellar or shed, if it is desirable to preserve the roots for spring propagation. They are easily multiplied.

Green and Hot-Houses.

Heat, air, water, and insects, are the principal things to be managed in this department.

Heat must of course be governed by the nature of the plants. Amateurs are apt to keep the house too warm, especially at night. There should be about 15° difference between the day and night temperature, the change being gradual.

Air is to be given whenever the outside temperature will allow the ventilators to be opened.

Water.—The frequency with which this will be required will depend upon the temperature. Where the house is large enough to warrant it, a force pump and hose will save much labor in watering.

Insects.—Tobacco smoke is the main reliance to kill the green fly, and the red spider has a horror of showering. The thumb and finger will do much.

Bulbs in pots should be brought from their cool quarters, a few at a time, for a succession.

Sods.—The basis of good potting soil is well-decomposed sods. These may be collected now in a mild spell, and stacked up, laying the grass sides together, to decay. This is a stock of which one can hardly have too much, and the heap of it should be increased at every favorable opportunity.

AMERICAN AGRICULTURIST.

ORANGE Judd & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.25 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

A Genuine "Gift Enterprise."

Eighty Thousand Valuable Articles.

Worth from \$5 to \$650 Each,

OFFERED TO OUR SUBSCRIBERS.

FREE OF CHARGE.

The above, if unexplained, would appear a little startling, in a journal that constantly exposes the frauds of "Gift Enterprises," but this is a genuine affair, meaning just what is announced, as explained below. Please examine it carefully.

Our circulation is so large, and the cost of providing an office, editors, engravers, printers, stereotypers, and of collecting information, etc., etc., is divided among so many, that we can furnish a paper unequaled for size, beauty, and real value, at a very low price. Then, the great circulation makes our advertising pages so valuable that we have a large surplus to give in good premiums to those who aid in keeping up and increasing the number of subscribers from year to year. There are tens of thousands of people who gladly subscribe for a journal of this kind, when saved the trouble of annually writing and remitting money for it, by some one who acts as "agent."

We therefore wish, in some way, to remunerate one or more persons at *every post-office* for collecting and forwarding the names and money of old subscribers and enlisting new ones. To save immense correspondence, and obviate inquiry about the responsibility of local agents, we simply offer definite premiums, open to all alike, so that everybody desiring to do so can gather a list of names where he or she is acquainted, and thus secure the premiums. By large cash purchases, at wholesale prices or less, and

by special advertising arrangements, we are able to select first-class articles, such as are everywhere wanted, and offer far *larger* remuneration than we could possibly pay in cash, while the premiums are equal to cash. Many persons canvass as a business, receive and sell the premiums at the regular price, and thus obtain much higher wages or salary than they could obtain in any other way. Some persons (including several ladies) have thus realized \$200 to \$800 each, during the past three months! There is abundant room for many thousands of others to engage in the same business, though our general aim is to enlist one to five residents near each post-office, who will work from year to year, and receive some premium article each year that may be a useful keepsake. So much for the general aim and results of our premium scheme.

Now about the heading of this article: There are over 30,000 post-offices within the bounds of our circulation in the United States and Territories, the Dominion, etc., having around them an average of about 200 families each, some much more, and others much less than this. At many of these offices we have two, three, four, and five premium clubs, numbering from a dozen to five hundred in a club, and averaging about thirty. From our premium books we estimate that one premium club of a dozen or more could easily be gathered at every one of the 30,000 post-offices. There is that number of families or persons who would be benefited by the paper far beyond its cost, and who would take it if properly presented by a home canvasser. Judging from what has been done in many places, which are fair examples of all others, there can be two premium clubs, at one-sixth of these offices; at another sixth, three clubs; at another sixth, four clubs; and at another sixth, five such clubs, leaving 10,000 to have only one club each. This gives a total of 80,000 premium lists to be easily gathered, if enterprising persons simply take the work in hand. (This, at an

average of thirty to a club, would supply less than one family in six with the paper.) Now we offer one of our premiums for every club that shall be forwarded, even up to 80,000! Our premiums are standard articles, of which any required supply can be furnished (excepting only the animals), and we have the facilities for giving 80, or 80,000 premiums, or more!

Well, friends, the object of the above is to show that there is an almost unlimited field for us and for *you*. One-half of all our present subscribers, on an average, may *each* get a premium. We are ready to do our part *well* and promptly. It gives us great pleasure to send off load after load of these fine premium articles, and, as we know by thousands of letters from those who have had them, they give great satisfaction and pleasure on their arrival. We have been sending them off daily for nearly three months past, in return for subscribers sent in for next year. This month of

DECEMBER

is a Harvest Month—the best of the year for raising large as well as small premium lists *rapidly*. The Editors are hard at work getting up a valuable and beautiful number for January 1st, and those whose names come in soon will have it in hand before New Year's Day. Send names in as fast as secured, so that the paper may be promptly received by each, and *at any time* within six months, (when the list is as large as you can make it), choose the premium and it will be promptly sent. The Table of Premiums and notes accompanying, give all needed particulars. For full description of each Premium, see October number, with additions in November; or send for an extra copy of the Descriptive List, which is furnished free to any one desiring it.

Now, Friends, one and all, we respectfully solicit your earnest and immediate co-operation in swelling our roll of readers, far beyond all former years, not only for the good the paper will do those who receive and read it, but for the pleasure

it will give us to send and *you* to receive

One of the very valuable **Breeding Animals**;
Or a pair of the very beautiful **Poultry**;
Or a choice Parcel of excellent **Seeds**;
Or \$30 worth of reliable **Nursery Stock**;
Or a choice from the best **Sewing Machines**;
Or the best Clothes **Washer or Wringer**;
Or Some of Hart's **Extra Plated Ware**;
Or Patterson's unsurpassed **Cutlery**;
Or one of Prince's melodious **Melodeons**;
Or Steiway's **Superb Piano**; or a **Collibri**;
Or a genuine **American Watch**;
Or one of those excellent **Guns**, (two kinds);
Or a valuable Chest of **A No. 1 Tools**;
Or a good **Gold Pen**, "nigher than a sword,"
Or a Woodruff's most valuable **Barometer**;
Or a **Mowing Machine** that is a Mower;
Or a **Valuable Plow** (two kinds offered);
Or a **Hand Engine** of great convenience;
Or a "Just Weight and Balance," (**Fairbanks**).
Or a Box of Crandall's **Blocks** for Little Folks;
Or an "Open and Shut" **Pocket Lantern**;
Or a Magnificent Library (in the **Cyclopedia**);
Or a Great and Valuable **Dictionary**;
Or a Set of our fine **Back Volumes**;
Or your choice of the best **BOOKS**.

Choose one or more things, and get them *this year*, and then others next year, and so on. A **Premium Club** now will open the way for a *larger* one next year. *Determination and perseverance will secure it.* What thousands of others have done successfully, *you can do.* And it may as well be done now, as next week. "Push things," and you will have the Premiums secured in "Double Quick time." Let us have the first instalment of names on your Premium List, the first week in December.

Read and carefully note the following: (a) Get subscribers anywhere; all sent by one person sent together, though from one or a dozen different Post-Offices. But... (b) Say with each name or list of names sent, that it is for a premium list, and we will so record it. (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. Any time, from one to six months, will be allowed, to fill up your list as large as you may desire. The premium will be paid *whenever* you call for it.... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts.... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get those that we offer the premiums.... (f) Specimen Numbers, Cards, and Show-bills, will be supplied free as needed by canvassers, but they should be used carefully and economically, for every extra copy of the paper costs, with the 3c, prepaid postage, about 12 cents.... (g) Remit money in Checks on New York Banks or Bankers payable to order of Orange Judd & Co., or send Post-Office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Postmaster, and take his receipt for it. Money sent in any of the above ways is at our risk.

[In this table are given the regular cash prices of each article, and the number of subscribers required at \$1.50 a year, to get it free, also at the lowest club rate of \$1 a year. For full descriptions of the articles see extra sheets sent free.]

Table of Premiums and Terms, For Volume 28—(1869).

Open to all—No Competition.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The thirty-two Premiums.

Nos. 29, 30, 31, 61, 62, 63, 64, and 76 to 100 inclusive, will each be delivered FREE of all charges, by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories. —The other articles cost the recipient only the freight after leaving the manufacturer of each, by any conveyance specified.

Description of the Premiums.

A FULL DESCRIPTION of all the premiums is given on an extra sheet, a copy of which will be sent free to every one desiring it. We have only room here for the following:

Nos. 76 to 81—Volumes of the American Agriculturist. (Unbound). —These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information than these subjects can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-seventh Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.50 if sent by mail, as they must be post-paid. They are put up in clean numbers with full index to each volume. —They are profusely illustrated; the Engravings used in them having alone cost about \$30,000. Those obtaining premiums for less than twelve volumes can select any volumes desired, from 16 to 27.

Nos. 82 to 87—Bound Volumes of Agriculturist. —These are the same as Nos. 76 to 81 above, but are nearly bound in uniform style, and cost us more for the binding and postage. Sent post-paid.

Nos. 88 to 99—GOOD LIBRARIES. —In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 88 to 99 may select any books desired from the list below, to the amount of the premiums, and the books will be forwarded, *paid through*, to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 100—General Book Premium.

No one not desiring the specific Book premiums, 88 to 99, may select Books from the list below, to the amount of 10 cents worth for each subscriber sent at \$1; or 30 cents for each name sent at the (ten) club price of \$1.20 each; or 60 cents worth for each name at \$1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.*

BOOKS FOR FARMERS AND OTHERS.

[For sale at the Office of the Agriculturist, or they will be forwarded by mail, post-paid, on receipt of price. All these are included in our Premiums, Nos. 88 to 100, above.]

and practice, if they choose, the very processes which he finds most profitable. With this view he has written *Practical Floriculture*, in which he tells all the "secrets" of the trade in vigorous Hendersonian style, and he gives full instructions in his way of doing things. Not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure, as well as those who make them a matter of trade. The work is characterized by the same reliable common sense that marked his "Gardening for Profit," and we predict for it a similar popularity. Special contributions have been furnished by Messrs. E. A. Bannum, Jas. Fleming, and others. Beautifully illustrated; ready in January.

Send as a Holiday Present, to a country or other friend, a year's subscription to the *Agriculturist*. It will be useful, and will remind the recipient of the giver, every time it comes to hand. When desired, in such cases, the Publishers enclose in the first number an office receipt, marking on it the name of the donor.

Cattle Diseases.—A new work by Prof. John Gamgee on Cattle Diseases, adapted to the needs of American farmers and breeders, is in the course of preparation and soon to be issued by Orange Judd & Co. Prof. G. has been for nearly a year past, and is now, studying the diseases of American neat cattle and will be greatly obliged for any information which will add to the accuracy of his knowledge on this subject. Address, care of the Publishers of the *American Agriculturist*.

Seeds.—Please understand that we send out no seeds to subscribers, except in collections, as stated in our premium lists. We have no seeds whatever for sale; those wishing to purchase should apply to dealers, the names of several of whom are to be found in our advertising columns, and who will fill orders by mail, with care.

Sundry Humbugs.—If any one supposes because we have routed and defeated the "Gift Enterprise" we have done with humbugs, he makes a great mistake. These were only the right artillery of the grand army; being able to move rapidly and change front often, we were obliged to follow them up to the neglect sometimes of other divisions of the enemy. Having driven back this battery, and Congress having spiked their guns, we can attend to some of the intruded forces.

Mutual Benefit Associations. Be cautious here! Some of these are doubtless started in good faith, while others are pure frauds, as no such "companies" are to be found at the places advertised. We have called at the offices of several of these associations, as designated by their circulars, etc. At some we found a regular office with the usual outfit of desks, clerks, books, etc., such as pertain to an ordinary Life Insurance Co., while in other cases we found ourselves confronted by the "shut-out" of some old offender in the quick doctor line. These old chaps avail themselves of every device to bring fish into their nets, and "agents" for a Mutual Benefit Association is one of them. Assuming that an association of the kind is managed by honest hands, of what "benefit" is it? We have looked into the plans, and as they have been presented we fail to see any inducement for anybody to invest. An association of this kind is not a Life Insurance Co., but a "Mutual Association" for the benefit of deceased members. Let us look a little closely at the plan. One of these associations proposes to classify members by their ages. For instance, persons between the ages of 20 and 25 years make one class, those from 25 to 30 another, and so on. We are told that each class, when complete, will have 5000 members. The "Mutual Benefit" consists in this,—when one member dies in any class, each of the survivors is to pay a dollar for the support of his family. Suppose you join a class at 20 years of age and live until you are 60 years old. What have you to pay out as a tax for deaths in your class for forty years? Taking their estimate, that thirty members will die in each class every year, you are taxed \$1 for each death, (it is generally a few cents more, to defray postage, etc.), which would amount in forty years to \$1,200. But at this death rate it would take over 100 years for any one class to die off which is over three times longer than the average duration of human life. So that, in reality, if you pay \$1 for each member who dies, you will in forty years have paid say three times \$1,200, or \$3,600. Suppose at the end of that time you die, what will your family get from the association? The \$3,600 represent 3,600 deaths out of 5,000 members; so that your family get for your outlay of \$3,600 just \$1,400, at the time of your death. Of course the association claims that the class is kept up to the full number by addition of new members, but this is not practi-

cable. We are well assured that an old organization of this sort of several years' standing has only a few hundred members including all ages, and that for a year or more the admission of new members has not more than equalled the death rate. From all we can learn, then, we feel assured that these "Benefit Associations" are ill advised, impracticable, and unsafe. We would suggest to persons visiting New York to avoid the various cheap jewelry and plated ware vendors in basement stores and on streets leading from the Railroad Stations and Steamboat Landings. Every few days we hear complaints of swindling at these places, principally of strangers who are spending a few days in the city. It is a safe rule never to buy a thing you do not want, no matter how cheap it may be, and this holds doubly true with jewelry, plated ware, and the like. If one wishes to purchase articles of this kind, let him go to a regular dealer, and if he is a stranger in New York, let him step into our office and we will tell him where to find one; but let him keep out of all underground places of this kind. "One Dollar" shops are multiplying; it is the old "anything on this board for a shilling" expanded to a dollar. These shops differ in extent and style, but take them as a class, there is no advantage in them, but the contrary. Persons may be reassured that merchants do not sell things for less than their value. And we have yet to see the article worth more than \$1.00 to be had at these places. Their main stock in trade is "Fine Gift Jewelry" and galvanized trumpery called "plated ware." We deprecate most earnestly the taste that seeks after and uses such stuff.

The Fair of the St. Louis Agricultural and Mechanical Association was a grand exhibition, and we regret to be obliged to use the name of St. Louis or of Missouri in an article on Humbugs; but the truth obliges us to protest—and all right thinking people in Missouri will sustain us in it—against complicity so noble a fair with a base swindle. Every lottery, every drawing, every game of chance of every kind, we hold to be a crime and a fraud against the public, and we cannot except the "Grand Drawing of the Paschal House Association." Even if this drawing was held on the fair grounds, and even if the Mayor of St. Louis did so far forget his office as to preside at the drawing, we can not the less denounce it. Many bought tickets, and but few drew prizes. Many fools lost their money, and a few shrews made a pile. Notwithstanding the drawing was held on a place dedicated to better things, and the presence of the Mayor of St. Louis gave promise that "everything was serene" somehow—nobody can tell how, and wouldn't if he could—the chief prizes happened to go to the members of the association aforesaid. Didn't the St. Louis people ever hear of the great "Crosby Opera House Lottery"? We will give the Mayor credit for being ashamed of his share in the swindle, as he has published an article stating that the whole thing was unlawful and wrong, and "warns all persons from entering into any similar enterprise whatever." That warning is very good of the Mayor, and if, as Sambo said it had come "just previously before" instead of "just previously after" the "drawing," it might have had some effect. Wheat that produces 300 bushels to the acre! Let every body send at once to the "Southern Experimental Company," and get—beautifully sold. Mr. S. E. Company—whoever you may be—you are very green. If you had put it at 50 or even 100 bushels, the thing might have caught a few, but you have spoiled the whole with your 300 bushels. "It outwits all acclimated novices"—we should say so. It is "Rocky Mountain Mammoth Wheat," of course it is, and wasn't the Pacific Railroad built by the S. E. Company, all on purpose to bring in this Mammoth thing? "It is unlike wheat in every respect, except it makes a very good flour." Why call it wheat at all? Why not say what the thing is? "Entirely new kind of Grain"—confounded it—kely story. "How to send money" is a very necessary direction. Few will be fools enough to heed it. "Southern Experimental Company," try again. Farmers are liable to be swindled at their own doors. One of the latest dodges is for a couple of claps with surveyors' instruments to come along, pretending that they are surveying for a railroad the line of which will run directly through your farm. For a consideration of \$50 or so, they can be induced to go a little to one side. If any such fellows come along, ask to see their authority. If they can't show any, then show yours, and order them off the premises.

Aquarium.—"Ellic."—You will find a note on feeding gold-fish on page 418, last month. Any plants that grow in our ponds and deep streams, nearly or quite submerged, will do in an aquarium. The Water-Banunculus, Water-Milfoil, and Honey-wort are among those most used. These are now probably in their winter state, and must be sought for at the bottom.

The Concord Grape in Missouri.—A. A. Blumer, Pike Co., Mo., writes that, in 1896, he planted 1500 vines of Concord, which fruited this year,

and proved a failure. Mr. B. says that, "apparently, the Concord does not improve here in Pike Co., but proves as bad in the West as in the East, any assertions to the contrary notwithstanding." The Iowa and Delaware do well in his neighborhood. On the other hand, the Mississippi Valley Grape Growers' Association have recently decided by a vote, which we think was unanimous, that the Concord is the best grape for Missouri. All this goes to show that the question of varieties is a local one. No one variety of fruit can be the best for every part of any State, especially for one so large as Missouri.

Clinton Grape Blighting.—J. Wells has a row of Clintons on each side of a garden walk; a drain from the cellar runs close by the roots of one row. The same grape in other parts of the garden does well. The trouble probably is the drain from the cellar, which keeps the soil around the roots unduly moist.

Salsify and Parsnips.—"J. W." Warren, Ill. These are left in the ground mainly as a matter of convenience, as it saves trouble in storing, and some think that they are improved by the action of frost. In our notes for the month, we always advise lifting and storing a sufficient quantity to last during the time the ground remains frozen. There is no necessity for leaving them until spring. Either parsnips or salsify may be eaten, when large enough, in summer or fall.

Twelve Thousand Dollars' Worth of Engravings, at least, will be given in the *Agriculturist* during 1898. To obtain neatly printed copies of all these, will cost only \$1.50, or less to clubs, with all the reading matter thrown in.

A Book to Make a Good Farmer.—"Juvenile," Athens, Tenn. A young man desirous of being a good farmer wishes to buy the best book for beginners. The young man wants a practical book. He had better let theory alone until he has a good foundation of agricultural practice and experience to guide him. This he will get ten times as fast in the garden as in the field, and so we think the very best book we can put into his hands is Peter Henderson's "Gardening for Profit." In this he will learn, 1st, the value of clean, deep, thorough tillage; 2d, the importance of manure; 3d, that well-directed labor pays; 4th, the importance of good seed; 5th, the necessity of raising such crops as one has a quick market for. These lessons from the garden are the most important ones that a young farmer can learn and practice, and are just as applicable on a 1000-acre farm in Illinois or Tennessee as in a Jersey market garden. See book list. *Gardening for Profit* is \$1.50 by mail.

The American Horticultural Annual will be ready at the beginning of the year. It will contain valuable communications and reports by many of the eminent horticulturists of the country, and in intrinsic value and beauty of illustration will, to say the least, be equal to the volumes which have preceded it. Price, by mail, 50 cents, paper; 75 cents, cloth.

How to Plant Hickory Nuts.—"T. J." We have not had much experience, but found last year that Hickory nuts sprouted well-laid in sand under a flat stone, where they remained moist all winter. This year we are planting some upon a mass of forest leaves in a furrow, covering with leaves and soil 3 inches deep.

Steaming Food for Cattle, etc.—Herbert Mead, of Cross River, wishes information which we can hardly give without gratuitously advertising Mr. Prindle's apparatus, which it is not our business to do. So far as we know, the steaming is not done under pressure, and the effects of steam upon fodder at high pressures has never, to our knowledge, been the subject of experiment, and is an important subject for investigation.

A Christmas Show of Poultry.—We publish an advertisement of a National Show of Poultry to take place Christmas week in Philadelphia, under the auspices of the Philadelphia Poultry Club, which is composed of men whose names give a character to the undertaking, and place it above suspicion.

The Potomac Fruit Growers' Association of Alexandria and Fairfax counties, Va., was organized on the 11th of September by the election of Hon. Charles H. Brannhall, of Fairfax Co., as President, with Mr. Robert A. Phillips, of Alexandria Co., as first Vice-President. This is the first association of the kind yet formed in that section of the country, which has great capabilities for fruit raising, and we trust that similar societies will be formed in all parts of the country.

IT WILL PAY.—Half a dozen intelligent and thoroughly practical men are constantly engaged in hunting up information, examining and sifting all they can hear, read, and see, and the results of their labors are condensed into these pages in as readable form as possible. The paper is as valuable for what it leaves out—as useless, or worthless, or worse—as for what it prints. Can any one go through *eight hundred columns* of such matter, given in this journal each year, without getting some hint, or some train of thought that will, in the end, result in a profit of far more than the dollar, or dollar-and-a-half, it costs? The four hundred engravings will alone give much more pleasure and profit than the money would bring in any other way.

Ten Million Dollars Saved!—Anybody who will examine the tens of thousands of letters, circulars, etc., which we have received concerning the operations of the humming fraternity, will very readily endorse the estimate recently made that this journal alone has saved to the people of the country at least ten million dollars that would have gone into the pockets of swindlers, but for the exposures and cautions given in these pages. The truth is more than half of the people of the entire country have been cheated by the swindling operators of one kind and another, though few people are willing to let it be known that they have been in the trap. But since this journal has obtained an almost universal circulation, the swindlers have found their occupation gone, or nearly so. One of the leading operators recently remarked, that "they ought to have raised money enough to have bought out the *Agriculturist*, type and all, and shut it up."—*Mem.* It is not for sale, and will not be until the Humbugs are made too poor to buy it.

Save the Index Sheet, which is put loosely in this number, so that it can be bound or stitched at the beginning of the volume without cutting the thread.

Bound Copies of this Volume will soon be ready. Price, \$2, at our office, or \$2.50 each, if sent by mail. Any of the previous eleven volumes (16 to 26) will be forwarded at the same price. Sets of numbers sent to our office will be neatly bound in our regular style for 75 cents per volume, (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Clubs can at any time be increased, by remitting for each addition the price paid by the original members, if the subscriptions all date at the same starting point. The back numbers will, of course, be sent to added names.

"Death on Humbugs."—The other day we received a club of subscribers from a mountainous coal region in Pennsylvania, sent by a miner who remarked that: "We have not a foot of land to cultivate, and no time above ground to work any, but we take your paper because it is death on humbugs. One of our miners had the paper sent him by an Eastern relative last year, and a single item in it stopped the forwarding of \$400 made up in our mine to send to a plausible gift enterprise. This is only one case. A lot of us estimated last week that the single copy of the *American Agriculturist* taken here has saved in one mine several thousands of dollars. The paper has been loaned and read until each copy has been worn out, or soiled too much to be longer read. Our wives and children are eager after it, and the pictures are greatly interesting, even to us begrimed miners."—"We give this as a specimen of a multitude of other similar testimonials. The work pays in the satisfaction it gives, notwithstanding the labor it makes.—Thanks to the aid our exposures have drawn from Congress, the mails are measurably closed against a considerable class. But, like diving ducks, they will bob up somewhere—they are too lazy or naturally too dishonest to work for a living—and we shall keep our trusty gun well loaded, cocked, and aimed, ready to pick off every broad bill that comes to the surface.

"The Hunter and Trapper."—In this little work, just published by Orange Judd & Co., and advertised on another page, Mr. Halsey Thrasher, an old hunter and trapper, relates his experience. When a boy, like many others, he became fond of a gun and trap, and his first success, as he tells us, was in making a steel trap in the blacksmith's shop where he had been placed to learn a trade. From his first exploits, of catching foxes, to the time when he became an expert trapper of the bear and hunter of the deer, very much, of course, was learned, and in his book this is all told in a manner that cannot fail to interest all who would care to hear an old hunter's story. The best modes of hunting and trapping are given, with hints about guns, rifles, and traps, and directions for tanning skins, etc. The work is illustrated. It is neatly bound in flexible covers, and will be sent by mail, post-paid, for \$1.

SPECIAL REQUEST

TO MORE THAN

100,000 of our Readers.

Though many subscriptions originally extended beyond this year, and large numbers have already renewed for next year, in Premium Clubs and otherwise, there still remain more than 100,000 names to be renewed on our books before the wrapper writers can prepare for mailing them the next number. It would save us a *Thousand dollars* at least, if we could have these renewals come right in at the beginning of this month, so that the entries could all be made by experienced clerks, without the extra help and night work usually required the latter part of December. **Please oblige**

us, friends, as soon as you read this item, by sitting right down, and sending in your renewal for 1869. All the letter needed is, a few simple words, giving your Post-office, County, State, and Name, and the amount enclosed, all plainly written. If three others join you, the four copies cost only \$5. In making up a larger Club, please let the names be forwarded for entry at once. It will take no longer to attend to this about Dec. 1, than at a later date, while it will help our work greatly.

We take it for granted that every present subscriber will gladly continue reading this journal. The paper has kept right on improving, for many years past, and this rule will hold good hereafter. Each year's experience, and increasing mental and pecuniary resources, enable us to do better the next. Our success has been abundantly satisfactory, but we have higher aims, and we propose to ourselves to supply a greatly improved journal next year—one full of good things, of valuable practical information for all the people, and *beautifully illustrated* with the best things that first-class artists and engravers can bring forth. So we cordially invite all our large circle of readers to take a seat in the *Agriculturist* family for 1869, and bring along troops of new acquaintances for introduction.

Doors open anew for 1869 at precisely 7½ A.M. Tuesday, Dec. 1.—Admission Fee, for the whole year, only \$1.50, and less to companies.

Gardening for the South; or, How to Grow Vegetables and Fruits. By the late Wm. N. White, of Athens, Ga., assisted by J. Van Buren and Dr. James Camak. New York, Orange Judd & Co. Pp. 44. This work, which was long ago announced, is now ready. The death of Mr. White found a portion of the work in an incomplete state, but two of his horticultural friends, into whose hands he committed the task, kindly finished it, and it now appears to fill a long vacant place in our horticultural literature. It is the only work we have, written with special reference to the wants of the Southern States. Not only does the climate of these States require peculiar modes of culture, but it allows many things to be grown that cannot be raised at the North except under glass. It must not be supposed, however, that the work is solely for the benefit of Southern gardeners; the author has presented a treatise on gardening that will be found useful either North or South, and has discussed the operations of horticulture more extensively than is the custom with writers on gardening. The division devoted to fruits is mainly by Mr. J. Van Buren, a well-known pomologist of Clarksville, Ga., and will be found to be not the least valuable portion of the work. The lists of varieties that upon trial have been found suited to the South, are of especial value to those who contemplate engaging in fruit culture in that section of the country. The work is abundantly illustrated and contains a portrait of the author.—Price by mail \$2.00.

Tomatoes in Michigan.—"C. W.," Market Gardener, Detroit, writes his experience with tomatoes, which we publish as an illustration of the fact that varieties will not be equally good in all parts of the country. He says: "This spring I purchased seeds of the Early Smooth Red, Early York, Early Cedar Hill, and Keyes' Prolific. This seed was all planted in hot-beds, March 12th, and the plants were transplanted into their hot-beds, April 21st, 6 inches apart each way. They all received the same care, and were planted in the open ground May 23d. The Smooth Red ripened first, the Keyes' one week behind, Cedar Hill and Early York two weeks later still. The Cedar Hill is one of the greatest humbugs ever sent out. How any man can recommend it to be an early and smooth variety, I cannot tell. It is the latest and worst tomato that can be planted by the market gardener, and the Early York is not much better."

Grape Testing at Hammondsport, N. Y.—In October last, a number of gentlemen were invited by the Pleasant Valley Wine Co. to serve as a committee to subject the leading varieties of native grapes to the test for sugar and acids. Those who grow grapes on the large scale understand what this means; to others we may briefly explain. The relative value of grapes for wine making—other things being equal—depends upon the amount of sugar contained in the juice or must. Regarding the juice as a mixture of sugar and water, the more sugar there is present, the denser the liquid will be, and the instrument used in the test, called a saccharometer (sugar-measurer), will sink more or less as the liquid contains less or more sugar. To develop the greatest amount of sugar by proper treatment of the vine and ripening of its fruit is the great point with the vineyardist, as in selling his crop its value depends upon the quality of the must. The amount of acidity is of little importance in the better grapes, but is of consequence in those low in sugar. This is ascertained by observing how much solution of ammonia of a fixed strength is required to neutralize a measured amount of must. The committee was organized by the election of Hon. Marshall P. Wilder as Chairman, and the Hon. J. Stanton Gould as Secretary. The manipulation was skillfully performed by Mr. Watson of the Company. A detailed account will be published, and we only present the results in brief, with the remark that some of the samples of grapes had been subjected to the deteriorating influence of a severe frost. Delaware, raised by E. H. Burgess, 89 degrees saccharometer, 81 thousandths acid; ditto, D. W. Burgess, 103 deg. sacch., 73 10ths acid; ditto, W. B. Barton 92 deg. sacch., 94 10ths acid; ditto, Pleasant Valley Wine Co., 93 deg. sacch., 104 10ths acid; Isabella, D. S. Wagner, 84 deg. sacch., 54 10ths acid; Iona, D. S. Wagner, 101 deg. sacch., 86 10ths acid; Catawba, A. Eggleston, 89 1/2 deg. sacch., 124 10ths acid; ditto, Urbana Wine Co., 86 deg. sacch., 13 acid; ditto, E. H. Burgess, 91 deg. sacch., 13 2 10ths acid; ditto, Pleasant Valley Wine Co., 91 deg. sacch., 13 2 10ths acid; Waltons, Walter, Ferris & Caywood, 99 deg. sacch., 93 10ths acid; Diana, P. V. Wine Co., 88 deg. sacch., 13 3 10ths acid; ditto, Urbana Wine Co., 90 deg. sacch., 11 1 10ths acid; Creveling, P. V. Wine Co., 78 deg. sacch., 10 acid; Alvey, P. V. Wine Co., 83 deg. sacch., 124 10ths acid; Clinton, P. V. Wine Co., 55 deg. sacch.; Concord, P. V. Wine Co., 76 deg. sacch., 6 acid; Oporto, P. V. Wine Co., 78 deg. sacch., 12 5 10ths acid; Isabella, P. V. Wine Co., 76 deg. sacch., 124 10ths acid; Scuppernon, from S. C. apparently not fully ripe, 60 deg. sacch., 94 10ths acid.

Sell an Acre of Land.—If necessary, and stock your house with \$10 to \$20 worth of good books. You and your sons, if you have them, and your workmen, will read these; they will be kept out of mischief, and they will be led to think more, will be happier and more contented at work; and their minds will be disciplined to think more correctly. Such a collection of books will change the whole tone of the farm, and result in many profitable improvements.

The N. Y. (City) Farmers' Club.—Those who have thought us severe in our criticisms on this remarkable adjunct to the N. Y. Weekly Tribune are referred to the following extracts from the reports:

"James A. Whitney—Mr. Chairman: It is quite clear that this Club is a great power for good, when one of the members gives us a little of Moses, a little of Job, two Latin maxims, and some choice spread-eagle in one sentence, etc." * * * "P. T. Quien—Mr. Chairman: What would an English farmer think of us were he to step into this Club and find us so gravely discussing the propriety of cutting food for animals, and Gamaliel and all the doctors of the law thundering their anathemas against hay-cutters? He would think that we had not yet the farmer's alphabet to learn.... Why, Mr. Chairman, must this Club be forever meddling with the first principles, and laboring to upset the axioms of our profession? We make ourselves a laughing-stock all over a great continent, by advancing theory in the face of old facts, solid facts, proven facts."—The report does not state that Mr. Q.'s conundrums were answered.

Tyroler Larch.—"A. E. R." Fayette, Iowa. The *Tyroler* is a variety of the common European Larch. It is claimed that it possesses greater vigor of growth and durability in its timber than the ordinary form. Of this we have no proof, and it is quite singular that the *Tyroler* Larch, if it be so much superior, is not used in the great plantations of England. The European Larch, whether *Tyroler* or other, is a most valuable timber tree—probably the most valuable that can be planted. As to shelter, it must be remembered that although the Larch belongs to the *Conifera* family, of which most of the members are evergreens, it is a deciduous tree, and, as a shelter in winter, being without leaves it would be greatly inferior to a true evergreen.

Portable Fences or Hurdles.—J. H. Haven, York Co., Pa., wishes to employ his leisure this winter in making portable fencing, so that he can do away with the interior fences on his farm and pasture it to better advantage. We have published several plans, one of which may be found in each of the following numbers of the *Agriculturist*,—February, 1866, June and August, 1867. Hurdles can seldom be made strong enough to be a good defense against breachy animals. For these there is nothing like a good chain tether made fast to the hind leg. If any of our readers have convenient forms of portable fence unimpaired by patents we would be glad to hear from them and publish some of the best.

\$25 or \$50 worth of books pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land, on coming to manhood. The thinking, reasoning, observing man, will certainly make more off from 49 acres, than he would off from 50 acres without the mental ability which reading will give him. Far better to sell the acre of land than do without the books. The Publishers' premium offers, on page 437, open a way to get books without expense. The farmers of every neighborhood ought to put their heads together and raise a club of subscribers, receive the books, and hold them for general use by all.

Labor Exchange.—We have received the semi-annual report of the Castle Garden Labor Exchange for July, 1868. It is of interest, as it shows where the great mass of cheap labor, that comes to us from Europe, finds its market. The most thrifty part of these emigrants form their plans before they leave home, and press on to the great West, where friends have generally preceded them. Others come without any definite aim, except to benefit their temporal condition, with very little capital, and are compelled by their circumstances to accept the first opportunities for service that offer. To this class, which is much smaller than many suppose, the Labor Exchange is of incalculable benefit. It meets the poor emigrant on his landing with a ready market for the only commodity he has to sell. He is cheered and comforted at once with his brightening prospects in the new world. The statistics show 12,951 engagements in the six months; 15,316 applications for employment; and 15,700 orders for labor. The excess of these orders over engagements shows that there is little danger of too large

emigration to this country. More than five-sixths of these engagements are in the States of New York and New Jersey. For further particulars, address Castle Garden Labor Exchange, New York City.

Grinding Corn and Cobs.—"D. P. P." Williamsport, Pa. "Can you tell me if this practice, which prevailed in New England twenty or thirty years ago, is economical?"—The practice has been abandoned by wise farmers. In the cobs of sound, well-dried corn there is very little, if any, nutriment, certainly not enough to pay for grinding or cooking. In soft, half-ripened ears there is some nutriment, but they are not in condition for the mill. Then in grinding it was always noticeable, that the miller took his toll from that part of the heap where there was most corn and the least cob. Stock have the same kind of instinct as the miller, and it is best to gratify them. The bulk that is wanted in feeding cattle is better supplied with good hay.

Brewers' Grains—Value as Feed.—R. M. Bunker asks: "Please tell if it is profitable to feed malt as we get it from the brewery, to horses, cattle, swine and poultry. Is it injurious? What is its real value per bushel when corn is \$1.50? How should it be fed out?"—Ans.—The article referred to is not malt, but properly called Brewers' Grains, and is the barley after the sprouts have been removed and the malt extracted. It is excellent feed, not injurious, unless absurdly misused. It contains, according to S. W. Johnson's *How Crops Grow*, on an average about 76 per cent of water as obtained from the brewery, nearly 5 per cent albuminous matter, which is the measure of its nutritious quality, and over 1½ per cent of oily matter, while sugar, starch, gum, mucilage, etc., rich with the oil, all going to supply animal heat and fat, make up over 11 per cent. Compared with corn, which contains about 14 per cent of water only, it contains about half as much albuminous nutriment, one-fifth as much oil, and one-sixth as much starch, sugar, etc. It is generally worth as feed more than is asked for it.

Milk Experiments.—Mr. Frank J. Clarke, of Batte Co., instituted a course of experiments to guide him in managing his dairy. He is, we think, an accurate observer, and his results, which he sends us, tally very well with the views of those who have given the subject the most study. They are as follows: 1. The quality of the milk differs almost, if not quite, as much as the quantity given by different cows. 2. In buying get a sample of the cow's milk, if possible. 3. A cow gives richer milk when fat than when poor. 4. A cow gives poorer milk with the first calf than afterwards, other conditions being equal. 5. The older a cow is, the richer her milk, until her constitution begins to fail. 6. The longer the period which has elapsed since calving, the richer the milk. 7. The richness of the milk varies with the quality of the feed. 8. The richness of cream varies—that from the richest milk making the most butter. 9. A cow should be in first-rate condition when she calves; all fat goes into the milk. 10. The strippings or last milk is five to nine times richer than the first milk drawn. 11. A cow must be in good health, to give rich, wholesome milk. 12. Milk should be skimmed when 48 hours old and sweet.

Button Your Cattle's Horns.—It is an improvement to their looks, which is important whether you want to sell or keep them. It checks the bad habit of hooking, and they should therefore be put upon young cattle. If the old ones have already formed this habit, it prevents mischief, and all the animals fed in the same yard eat more quietly and thrive better.

Restraint for Breachy Cows.—Otis Ford, and a good many other farmers too, no doubt, keep their cattle from tearing down fences by bending a wire as large as a pipe stem so as to clasp in the nostrils of the animal, and then tying a piece of stout twine in this nose-jewel, on one side. Pass it through holes bored in the tips of each horn and back to the nose, where it is drawn moderately tight and tied. This plan presupposes that the animal has horns, and that they are of a shape adapted to the purpose.

Stone vs. Tile Drains.—"L. M. B." Scrabble, N. Y. "I have stones convenient, and wish to know if they will be as cheap, and serve as good a purpose, as the common tile drain."—We believe it is the unanimous testimony of those who have tried both, that tile drains are the cheaper, and better. The ditches have to be made much wider for the stone, which takes more labor, and unless there is a duct at the bottom the stones are soon clogged with mud and sediment, and the drain is spoiled. James S. Manroe, of Lexington, Mass., as reported by R. M. Copeland, drained a bog of thirty acres ten years ago, experimenting with stone and tile. Although the stones were near at hand and the tiles cost two cents a foot delivered upon the ground, he found that the

stone drains cost about 13 per cent the most. A part of the stone drains were without any duct at the bottom, and these filled so much in six years, that they had to be relaid. Those which had ducts choked more or less in five years, and the tiles were working satisfactorily after eight years. We do not know of an experienced land drainer, who does not prefer tiles. The stones are best used for the bottoms of walls and for filling up low places.

Free Martins Again.—"J. W. G." Lowell, Mass., writes: "Three of us neighbors, all old subscribers to your paper, have cows that brought twins; in each case one of the twins is a bull and the other a heifer. We want to raise them, but first want to know if it is true that they are not good for breeding."—Heifers coming thus, seldom, or more often than otherwise, do not breed. The name "free martin" has been given to them. They are often raised with a view of making beef of them at three or four years old, and most delicious beef they become. Sometimes they are broken to the yoke and matched with a twin brother, made a steer. The bulls, if used for breeders, are said to be frequent getters of free martins. We suppose there is little doubt that twin animals are more apt to bear twins than are others. A free martin has, if barren, a peculiarly ox-like look.

Potatoes on Sod Ground.—"H. P. H." Vinton, Ohio. "I want to plant potatoes next spring in sod ground, where sheep have been fed for two or three winters. When is the best time to plow, and how wide should the ground be marked? Should I fence or not? How often should the ground be plowed, and how often should the potatoes be hoed? How should they be cut, and how many pieces in the hill?—A good clover sod is one of the best preparations for potatoes. Any tougher sod is good to make a crop, and to guard against rot. The objection to it is the difficulty in getting the sod mellow enough for easy working. If plowed in August or September, the sod rots well. If plowed in the spring, it should be done deep enough to admit of cross-plowing without disturbing the sod. Harrow very thoroughly. Mark out the rows both ways thirty inches apart. Bush harrow just before the potatoes are up, to kill weeds. Start the cultivator or Shure's harrow a week or ten days later, going as near the potatoes as possible, and stirring all the surface soil. If the tops have a light covering of dirt it will not harm them. Cultivate them the second time the other way of the rows. Two or three eyes to the hill are enough. Go through the potatoes a third time, to pull weeds. This often makes a difference of twenty-five per cent in the yield. If the ground is made smooth and mellow, the hoe will hardly be needed. The advantage of hills over drills is that nearly all the weeds can be reached with the cultivator, and the expense of hand hoeing be saved. If the land is very rough and full of sods, the hoe must be used. Unless planted very early, cut into pieces with one or two eyes.

Tiles for Roofs.—"C. S. T." Stenbenville, O. "Is there any manufactory of tile for roofing in this country?"—We think not. This style of roofing is superseded by better articles. Tile is very heavy, and requires much heavier timber than is now used in buildings. Slate is quite as durable, much lighter, and we have inexhaustible quarries that need working.

Muck Mining.—"W. R. D." of Crawford Co., O. says he took our advice and went to mining muck as if he had faith in it, and "in digging a little deeper than usual found a substance (of a grayish color when dry) from one to five feet deep, overlaid with pure muck or peat, three to eight feet thick."—Our correspondent's experience is like that of multitudes of others. The bottoms of the peat beds are usually deposits of exceedingly fine silicious or calcareous sand, frequently filled with the remains of shells or minute animal organisms. They are seldom of any considerable value as fertilizers, except when calcareous deposits are found in large quantities, as is often the case. This layer, which is impervious to water, consists often almost wholly of small shells, the larger of which are of the size of mustard seeds or wheat kernels. Such a deposit is called shell marl, and is usually valuable as a manure on soils needing lime, and may pay for carting two or three miles.

Onions.—"N. J." Davenport, Iowa, asks if "we can get onions the first season from seed grown in California."—It is not probable that the place where the seed is raised will make any difference in getting onions, but if our correspondent expects such onions as are raised in California, he will be disappointed. We have known seed from New Mexico, where the onions are as fine as those of California, if not finer, to produce only common onions at the East. There seems to be something in the soil or climate, or both, of these States particularly favorable to the production of onions.

Foul Water in Cisterns.—"A Reader" says that the cisterns for watering cattle in his vicinity have become foul, and wants to know a remedy. This is occasioned sometimes by the falling in of earth worms or rats from the top, which die and putrefy. The remedy for this would be the cementing of the top of the cistern so as to keep out the worms and vermin. Sometimes the cistern has no ventilation, and the water is drawn by a pump. If the cistern were opened and an endless chain pump or a bucket with windlass were introduced to draw the water, the difficulty would be remedied. Even in wells the water is thought to be benefited by frequent agitation. Cisterns should be thoroughly cleaned once a year, and it is a safeguard against untimely cracking to make a wash of hydraulic lime and brush over the inside.

Soft Water Turning Hard.—"Subscriber," Still Pond, Ind. Locust trees growing near the well can have nothing to do with the change of the water from soft to hard. Some subterranean stream of hard water has probably found its way into your well, and it is not easy to suggest a remedy.

Inspecting the Bottom of Wells.—"L. L. P.," Cricksburg, N. J. All wells should be examined at least once a year, and thoroughly cleaned if there is any indication of filth upon the bottom. This is best done in the morning or afternoon of a clear day, by holding a mirror over the top, and reflecting the sunlight into the water. If the water is clear, everything upon the bottom can be seen with great distinctness.

Cement Pipe for Drains.—"J. M. J.," Danbury, has four or five acres to drain, and wishes to know which are the best tiles, the red earthen, or the cement, and how long the former will last in the soil. Cement tiles are used for carrying water, but not for drainage. Common red drain-tiles allow the water to pass into them at every joint, and are the best article for draining land yet discovered. If well made and sunk below frost, they are as indestructible as any other brick. Examined after fifty years' use, they are apparently as good as ever.

Increasing the Flow of Springs.—"O. C.," Amenia, N. Y. "I have a spring not high enough to carry water into the second story of my house, and not copious enough to force the water by a ram. Is there any way to increase the flow of the water in the spring?"—"If the ground in the neighborhood of the spring is wet enough to need drainage, put down tile, and make the outlet at the spring or near it. If the slope of the ground is sufficient to admit of laying the tile 4 or 5 feet deep, you will very likely get permanent water, and make it as copious as you desire by extending the drains. Water from tiles deeply laid is often as cold and as pure as that from a natural spring. Deep drainage sometimes increases the flow of springs, even where the outlet of the drains is turned in another direction. Layers of sand or coarse gravel are struck, which communicate directly with the spring, and the water flows through from the drains to the natural outlet.

Bones and Wood Ashes.—"S. J.," Ontario. You can hardly do better than to crack up the bones somewhat, mix them under a shed with the ashes, using, we will say, three bushels of ashes to one of bones, moisten them slightly but thoroughly, cover them with three inches of soil lightly packed down, and leave them so until spring, when the heap should all be shoveled together, and all the bones that cannot be mashed, thrown out. We have never done this exactly, but have repeatedly heard that it would work well.

Dry or Greasy Bone-Dust.—Deck Bros., Litchfield, Conn., having put up a mill for grinding bones and plaster, wish to know which is best for the land, dry or greasy bone-dust. Dry bone-dust is usually that which has been boiled to extract the oil; with the oil a large portion of glue or gelatine is also abstracted. In the soil the grease prevents decomposition of fresh bone for a while, and then hinders it for a still longer time. So the dust from boiled bones, or the dry bone-dust, acts more rapidly, while the other is worth more to the soil, being more lasting in its effects and containing more ammonia-forming material.

Harness Makers' Clippings.—"R. M. C.," Del.—"Do harness makers' clippings make valuable manure, and if so, what is the best way of reducing them?"—"They are a good manure, as all animal matters are, but it is somewhat difficult to reduce them. They can be roasted and ground fine. Or, if the mill be wanting, they can be mixed with caustic lime, and the slaking and heat will help to reduce them. Wood ashes or

potash will also act upon them, so that they will decay in a compost heap. They should be kept in a moist state for several weeks in contact with either lime or ashes.

Grinding Limestone.—"D. D. & Son," Alleghany, Pa.—The grinding of limestone would not pay for manure under any conceivable circumstances. It is much more easily reduced by burning, and then slaking it in water. In this state it has an immediate effect upon all soils well supplied with vegetable matter. A limestone soil is good for almost all farm and garden crops. For burning lime and applying it to the soil, see articles in Volume 26, 1897, pages 243, 283, 321, 322, 333.

The Best Stock for Pastures.—"H. A. T.," Milton, Pa. If the object be to enrich the land, sheep are the most desirable stock. They leave all their droppings upon the field, and distribute it very uniformly as they graze.

Bones and Ashes.—"S. J.," Bowmanville.—These articles are very good used separately or together. Coarsely broken bones are good placed in the holes or borders, where fruit trees and vines are planted. Ground, they make a good dressing for all farm crops, and are especially valuable for turnips and cabbages. Treated with sulphuric acid and water, they make superphosphate of lime, which is an excellent concentrated fertilizer. (See back Volumes.) Ashes are a good top-dressing for almost all farm and garden crops, and are especially valuable for fruit trees. They may be used for reducing bones by adding lime, mixing the bones with lime and ashes in a barrel or larger vessel, and pouring on water. They should be kept constantly moist. In a few weeks the bones will be soft, and may be mixed finely with the lime and ashes. If used in the hill, do not bring it in contact with the seed.

How to Kill Woodchucks.—"H. R. P.," Old Westbury.—Woodchucks are more easily trapped than most animals that infest our farms. They have not cunning enough to keep out of a steel trap properly set at the mouth of a hole. They are easily shot, and the boys are in favor of this mode of despatching them. In a clayey soil they are easily drowned out, if water is near. Some explode emporver in the hole after stopping it up, which is said to make short work with them. Strychnine, administered on a sweet apple, or any thing that they will eat, is effectual. If this is used, care must be taken to put it where nothing else will eat it.

A Volunteer Mother.—G. Simon, of Bloom, O., has a Black Spanish pullet which had never laid, that took charge of an abandoned brood of turkeys, clucking and caring for them as if she had hatched them. Similar facts are occasionally reported, and it is said that the maternal instinct may be developed by plucking the feathers from the breast of a pullet, or a capon, and confining it a few days with young chickens.

Moles Again.—"It never rains but it pours," and we have still another device for keeping moles out of cultivated grounds. R. W. Flower, Jr., Erie, Pa., writes: "When on a farm in Virginia before the war, a neighbor put up a small wooden windmill, (similar to the enclosed sketch), on a pole about 12 feet high, to scare off crows from a watermelon patch, just planted. It was soon noticed that the moles, which had been unusually plenty) had all left the field. Generally in that section of the State, from two to four mole ridges could be seen running to each hill, before the above plan was adopted. Each wheel seemed to protect a piece of ground at least 200 yards in radius. The cause for the moles leaving so suddenly could not be surmised for some time. One day when on the field I suggested it might be the sound from the wheel, and upon putting my ear to the earth about 100 yards from the wheel, the sound could be distinctly heard, the earth being such an excellent conductor of sound. The wheels are very simple and easily made, and almost every farm boy has one stuck on the smoke house or henery, as a weather vane."

Fermentation of Apple Juice.—A subscriber asks if cider, fresh from the press, will ferment if immediately bottled and made perfectly air-tight. Ans.—Apple Juice, coming from the press, always has sufficient contact with the oxygen of the air to induce fermentation. Air, in fact, penetrates the fruit itself; if the pressing were to take place in a space from which oxygen were excluded, fermentation would take place.

What Missouri Wants.—Our correspondent "W. B. J." expressed himself a little blindly, we think, in what he wrote. "We have paid high prices for our sheep, and now we are worse off than if we did not have any, as we cannot get the wool carded, and can

not get any more for our fine wool than for our coarse wool." He means they are worse off than if they had no high-priced, fine-wool sheep, and that is probably true. His statement is taken up by "J. M.," of St. Louis, who probably did not notice the preceding sentence—"We have some fine sheep, and want more." He writes:

"What we want in Missouri, to make wool-growing and sheep-raising profitable, is men who understand the business. Nowhere on the continent, in the same latitude, has nature furnished better adaptations for sheep husbandry. We have immense quantities of rich lands, as yet untouched by the hand of the husbandman, in almost every county in the State, admirably adapted to this business. Good animals, improved land sells in almost any county at from \$3 to \$12 per acre. Of course, the rate per acre above this, for improved farms, is regulated mainly by the cost of the improvements, and somewhat by neighborhood, or other surroundings. Anywhere south of the Missouri river, (which embraces more than half the State) by judicious management, sheep can be raised, with winter feeding for one to three months in each year—say an average of two months. I have, indeed, seen (an exceptional case) a flock wintered, seventy miles north of the Missouri, without any feeding at all, and come out fat and hearty at shearing time. 'Wool is now quoted at from 23 to 25 cents per pound, and '5 to 10 cents lower for dirty and burry.' In the live-stock market, sheep are quoted at \$1 to \$1.50, for inferior, ranging all the way up to \$3 to \$5.50, for No. 1 mutton. Your readers can tell whether or not they can thrive at growing and raising mutton sheep at the prices I have quoted." [No doubt they can, if they avoid fancy-priced fleeced-wools, and raise long-wools, as "W. B. J." would advise, and get more for both wool and mutton.—Ed.]

Florida Farming.—J. H. Donnelly, Ferdinand, writes that on land where he raised 5 bushels of corn to the acre he put in about 2 acres of tomatoes and shipped them to New York, for which he got about \$250 cash, fleeced no more. He planted 2 acres of cucumbers, manured the hills, and raised a good article, with the exception of their tendency to turn yellow at the vine end, which injured their sale in the New York market. The yield was prolific with a very dry season. The seed was a long, green variety. He says there is a great prejudice against the use of manure; and adds: "My land is extremely dry in its nature. Would you recommend manure? If you do, what kind? There is plenty of salt muck about here, and it adjoins my land. How should I prepare it to make a good fertilizer, and how long will it take to decompose?" This prejudice against manure is very common in the South, and accounts for the large territory known as "old fields," and "abandoned plantations" in all the cotton-growing States. Wherever manure has been introduced, it is found to pay quite as well as elsewhere. Guano and superphosphate, if good, pay well on the cotton crop, and much better in market gardening, where two or three crops can be grown each season from the same fields. The soil, from the description given, needs vegetable matter, and will be greatly benefited by turning in green crops, (corn, for instance, or good stable manure, if it can be had). Compost made of salt marsh mud will make an excellent fertilizer, and, by absorbing moisture from the atmosphere, will, in some measure, guard the soil against drought. It can be decomposed by lime or ashes, or by any animal manure. If exposed to the atmosphere a few months, and forked over, and made fine, it would benefit the land without any addition.

Express Charges too High.—We have numerous complaints from different parts of the country about Express Companies charging exorbitant prices, and some of our friends compare these charges with the postage by mail on seeds, etc., in packages of four pounds and under. Now it would be idle to expect the Express Companies to compete with the government in the carrying of such packages, as it would not pay. Something may, however, be done, towards keeping expressage within reasonable limits. In all cases, where practicable, parties sending should arrange with the Express Agent the exact charge for the delivery of the package to the party who is to receive it, or at the Express Office nearest its destination, and give notice of this agreement by mail. Then keep good natured with the officers and employees of the Companies. A long experience proves to us that much more can be accomplished in this way than by scolding and fretting. If drivers are impertinent, appeal to headquarters, but don't get vexed, for in most places the Express Companies have the monopoly, and of course an advantage. Remember that many people can be coaxed who cannot easily be driven.

Milking Stock for the South.—"C. Altmann, La., wants a good bull to breed with the native

cows. He says: "We all have cows, but of an inferior kind, and no thoroughbred bull could be found in this parish." "Point Comtee." Our object is to have cows which will give rich milk in good quantity; and I would request you to inform me what breed would cover these points best in our warm climate, and at what probable price a 1 or 2 year-old thoroughbred bull might be bought in the North and delivered in New Orleans.—The Devon stock has been tested in warm latitudes, and is said to do well. We should think the Ayrshire also would do well, and their reputation as milkers is rather better than that of the Devons. Procure a bull of a good strain of blood, and the grades will be likely to meet your wants.

Popular Deciduous and Evergreen Trees and Shrubs, for planting in Parks, Gardens, Cemeteries, etc. By E. R. Elliott. New York, Francis W. Woodward. This is a hand book of 123 pages, in which are pointed out the leading characters, uses, etc. of those trees and shrubs most generally employed in ornamental planting. So experienced a planter as Mr. Elliott could not fail to give much information which would be of service to the novice, who will find here just the practical points which most horticultural writers are apt to omit. As the work professes to be simply a guide in planting, it is not necessary to criticise its botany or its illustrations, which are equally good or equally bad—we are not quite sure which. Price \$1.50.

Sod Fences and Ditches.—"G. W. M." Sod fences and ditches turn cattle, but not sheep and goats well. They will stand the weather several years with very little repairs, if well made.

"Pepper Tree."—H. H. Howard, Lake Co., Miss. Your "Pepper Tree" is *Schinus molle*, and belongs to the same family with the Sunnachs. It is a native of Peru and other parts of South America, and is in common cultivation in warm countries. We hope to say more about it at another time.

The Western Beauty Apple.—Mr. S. R. Bailey, Lima, O., has sent us specimens of this very large and fine apple. The tree is a very vigorous one, and the leaves remarkably large, being sometimes six inches long and half as broad. This fruit is supposed to have originated in Ohio. Warden gives it high praise, and places it among the best in quality. "Flavor subacid, vinous, delicious, satisfying," describes the fruit as we found it. The season, September to Christmas, but it may be kept until March.

Injuring a Vineyard.—J. R. Hoessli, Onondaga Co., N. Y., asks if the State has the right to raise the water in a lake to the injury of the drainage of his vineyard. This is a question in law, which does not fall within our province.

Apple Melon.—"C. S.," Wilmington, Del. The melon you described is the Apple-seeded Watermelon. Thorburn and Bliss & Son, of this city have seeds.

A Girdled Elm.—"Disconsolably Unhappily," Potsdam, N. Y., has a fine Elm which has been, by mistake, girdled with an axe, and he asks how to save it. If the tree is a large one, we fear it is a hard case; still we should try, by bridging over the injury by means of pieces of elm, with the bark on, fitting them carefully, so that the new wood of the pieces and that of the tree will meet as nearly as possible. The parts where they join should be freshly cut, and the whole covered with a mixture of clay and cow dung, bound on with old cloths. The top should be cut back severely, to diminish the evaporating surface.

Cranberry Queries.—"M. K. B.," Norfolk, Mass. Spring is the best time to plant Cranberries. Eastwood's is the only work we have on the subject.

The Trotting Horse of America.—This is the title of a very neat 12mo. volume, by Hiram Woodruff, edited by Mr. C. F. Foster; published by J. B. Ford & Co., New York. Hiram Woodruff was by far the most successful, widely known, and respected professional trainer of trotting-horses in this country. His familiarity with the most famous horses was life-long almost, and being possessed of a clear, quick, shrewd mind, and an uncommon degree of common sense, with a remarkable memory, his influence among horsemen was very great, and the present high character of the trotting horses of this country is in no small degree due to him. This book was written chiefly from "Hiram's" dictation. It was published in chapters in *Wilkes' Spirit of the Times*, and now, as soon after the death of the

famous trainer as possible, it is given to the public, and will be found of great interest to all who love a good horse. The first eleven chapters, together with others scattered through the book, are chiefly instructive on handling, feeding, training, etc. Others are reminiscences of the trotting turf, told in a very pleasant way. It contains 412 pages, with a portrait of the author, and will no doubt meet, and worthily, with a very extensive sale.

Postage 12 Cents a Year in Advance.—The postage on the *American Agriculturist* anywhere in the United States and Territories, paid in advance, is 3 cents a quarter, 12 cents a year. If not paid in advance, twice these rates may be charged.

Flower Seeds.—Some time ago we published a communication on flower culture, from Miss O. M. Luke, Ohio, which brought her a large correspondence. She wishes us to say that ill health prevents a reply to her letters, and that the flowers about which inquiry has been made were from seeds and bulbs obtained from J. M. Vick, the well-known seedsman, Rochester, N. Y.

Profitable Use of Land.—"H. A. N." wishes to know how he can use five acres of good land to the best advantage. He is one hour by rail from the city. This depends so much upon the man and his circumstances, that we can give no very definite advice. If he lives upon the five acres, the best thing to be done is to make it tributary to the supply of the family and the domestic animals kept,—one or two horses, two cows, poultry, pigs, etc. The horses and cows are best kept by selling, about which much has been said in our past volumes. A half acre will be needed for a vegetable garden and small fruits, and another half for larger fruits.

Work on the Horse.—"J. L. W.," Providence, R. I., inquires for a work on the Horse,—one that treats the subject in a plain, practical way, and that is reliable as far as any book is in its statements. Herbert's *Hints to Horse-keepers* will probably meet the wants of our correspondent as well as any book in the market. Price \$1.15. The same if sent by mail.

Men and Fruits.—In that most charming and now almost forgotten "Fable for the Critics" of Lowell, he takes of the literary men of his time. He describes Hawthorne as being made of particularly fine clay, and as old Dame Nature was at the task of mixing she sang, and somehow the music got mixed with the clay which resulted in Hawthorne. In looking over the fruits produced by our pomologists, we have thought sometimes that their qualities and peculiarities became in a similar way blended in their productions. To illustrate from strawberries. Who could have produced such a plump, juicy, productive berry, with a good bit of spice in it, but just McAvoy himself? "Downer's Prolific" and his later "Charles Downing," in their unpretending, sterling, and reliable qualities typify our old friend Downer of Kentucky: and the latest candidate, "President Wilder," considering its origin, could it be any other than the rich, polished, perfect fruit that it is? Of course there is nothing in it—a fancy—nothing more.

An Egg or Two, or a Poor Cigar, each Week, costs more than the subscription price of this journal, with all of its fine engravings, its calendar of hints, its many items of information given in the "Basket" columns, and in its farm, garden, household, and children's departments!

The "Leaven Manure" Humbug.—One Palmer, of Dutchess Co., N. Y., issues a very shrewd circular, well calculated to deceive even pretty well read farmers. He claims to have a secret, and a secret lesson for making manure, and we believe also a secret manure. He sells, or wants to sell, "Rights" for \$25, and to all who take them he proposes to furnish a book of 200 pages, which is to be published "as soon as circumstances permit," which will tell where and how he obtained the leaven, and many other things. Besides, a receipt book of 24 pages is furnished, and the dupe will be told also how to make guano "powerful yet harmless," how to make poultice, bone-dust, chloride of lime, a substitute for plaster, etc., etc. Finally, Mr. Palmer wishes to engage those who give him \$25, to help him in his real estate and stock brokerage speculations. This man is no fool, though if we did not know to the contrary, we should say he were next to one, to expect a single sane man to pay him \$25 for the right to allow him (Palmer) to furnish him a book by and by. We have little doubt many a dupe will be found, and some, perhaps, will think that his \$25 is well spent. Palmer has probably been reading that little pamphlet now issued by the publishers of the *American Agriculturist*, called "Bommer's Method," which probably covers almost exactly the

same ground. The circular about the Leaven is so full of chemical and other blunders, that they appear to us to be willful misstatements. It is endorsed by a dozen or more certificates of people whom we do not know, but who may be very honest, good farmers; and the same may be obtained by any deceiver. If the trial samples of the manure he were to furnish were really good. Let secret things alone, as a rule; where there is real merit, there is no need of secrecy to make a thing go. "Bommer's Method" costs 25 cents, and is well worth it, though we do not endorse it at all, and we do aim to give our readers sounder views on the same subjects every year.

More Labor Wanted on the Farm.

A thriving farmer to whom we put the question, "What item of expenditure pays best in your operations?" answered "Labor." He had then in the field six men and kept them constantly at work for nine months in the year. He had but sixty acres of land, yet the gross products were about fifteen thousand dollars a year. A single item in this year's crop was 6,000 bushels of seed potatoes. His rough farm was rapidly rounding into form under his plastic touch. Old stone walls had been removed, and the small fields opened into large ones. Rocks had been blasted and sunk, and the rough places made smooth. The wet places had been made dry by deep drains. He subsoiled, and guarded every crop against drought. He kept at work upon improvements, and made the crops pay for them. He said he regretted nothing so much as that he had not employed more help. This clear-headed farmer is unquestionably right. Nothing pays so well as labor, even at the present high price. Almost all farm products have advanced more than labor in the last eight years. And if this were not so, we think in the single item of improved implements the farmer has an advantage that more than balances the increased price of labor. He can make hay cheaper with these tools to-day than he could ten years ago without them, though he pays a third more for labor. Yet many of our farmers doubt this, and continue to apply the labor of one man to a hundred acres, and call it economy. We have no doubt it is the most expensive mode of applying labor. Almost every thing can be made cheaper on a large scale than on a small one. The publisher makes very little on a thousand copies of a work; on a hundred thousand he would make a small fortune. It will not pay to build a factory and use power looms to make cloth for the use of one family; to clothe the people of a State it is a very good business. Most farms have every requisite but labor to grow four or five times their present amount of crops. They have land enough, and often all the materials for making manure. They lack the men to haul the sea-weed, the muck, or the marl, to burn the lime, and to handle the compost. For lack of labor three-fourths of their capital lies idle, or pays them barely two per cent per annum. One great advantage of plenty of labor upon the farm is the ability to do every thing at the fitting time. Nearly half the expense of handling muck is saved if it is dug out in a time of drought. Three-fourths of the labor of tillage is saved if the men are put into the field as soon as the weeds are in sight. Every crop is followed up with timely care, and is raised at the least cost. There are improvements that almost every farmer has upon his mind that never get done for the want of labor. He knows that underdraining is paid for by the extra crops of two good years, leaving the land more than doubled in value for a lifetime. He never finds time to do it. He knows that manures pay well, yet he never makes half the amount he could use to

advantage. We need to do business on a larger scale to make farming pay better. We must have faith in our calling, and invest capital as liberally as the merchant or manufacturer does in his. There is much less risk in our business. We can afford to make our ventures larger. As a matter of fact the farmers who make the most money in this country are those who employ the most help, and most wisely direct it. In England they will often spend more capital and labor in manuring and working an acre of land, than we do in its purchase with the expense of manuring and working added. At this season, when we sum up results and forecast the future, let us plan to use more labor.

Silk Culture in California.

BY THOMAS A. GAREY.

[Since the following communication came to hand, we have received from Mr. Prevost a neat and useful hand-book on Silk Culture, and from Mr. Garey, through the politeness of Mr. T. B. Austin, several hundred cocoons of remarkably large size and fine appearance. The fact that perfectly healthy eggs can be raised in California is of importance to every one who uses silk, as the disease that prevails among the silk-worms of Europe has already produced great distress in the silk-growing regions.—*Ed.*]

The cultivation of the Mulberry and feeding of silk-worms was commenced in this State by Mr. Louis Prevost, of San Jose. Being well acquainted with the requirements in soil and climate for the successful culture of silk, he became satisfied that this climate was peculiarly adapted to the business. After a few years spent in observation, he was induced to try the experiment of importing silk-worm eggs, having already planted Mulberry trees preparatory to the enterprise. After a number of unsuccessful and discouraging attempts to import eggs, he at last succeeded in obtaining some in good order from China, and from these date the first silk-worms of California. It has required years of labor, and the expenditure of thousands of dollars by this indomitable spirit, to establish this business on a respectable basis.

An old and deep-rooted prejudice, growing mainly out of the "Morus muleitanicus" excitement, had to be uprooted. State and county fairs regarded the enterprise with a suspicious eye, and paid but little or no attention to his exhibitions of cocoons, while at the same time they awarded premiums to many things of no practical importance whatever.

But faith and perseverance at last prevailed, and the present exhibition of silk cocoons from all parts of the State, at the Mechanics' Fair in San Francisco, attracts an attention from visitors truly wonderful. Old and established prejudices are disappearing, and the people begin to see and understand that the failure of this business in the Atlantic States was entirely attributable to climatic influences.

We have a soil unsurpassed for the production of the several varieties of the Mulberry required for the successful feeding of the silk-worm. We have a climate unequalled for its evenness of temperature, with an entire absence of explosive electricity and showers of rain during the feeding months. As the result, our worms are perfectly healthy, each worm making a cocoon, with no percentage of loss from any cause whatever.

Mr. L. Prevost, the pioneer, has from time to time sent eggs to different parts of the silk-producing districts of Europe, from which continuous good reports have been received. And

in consequence of the disease among silk-worms in those countries, they are compelled to import all their seed or eggs. The California eggs have established a reputation far exceeding the most sanguine expectations of Mr. Prevost. The consequence is, he now has standing orders for all the California eggs produced. As the production of silk is an exceedingly profitable business, and the production of eggs vastly more so, the people of this State are beginning to engage in this business with a thoroughness characteristic of California, and in a few years we will be able to supply the Old World with eggs of a better and healthier quality than can be obtained elsewhere. Now for a few items and figures in relation to the profits of the business, which have been demonstrated by practical tests by myself and many others. According to our simplified silk culture, one hand, man or woman, or a boy or girl 8 to 10 years old, can feed and attend, from the hatching of the eggs to the cocoon and laying of eggs, 100,000 worms. The cocoons produced will weigh about 333 lbs., worth, at lowest rates, \$1.50 per lb., amounting in round numbers to about \$500. The time occupied six weeks.

But by producing eggs, we find a much better return. For instance, we select one-half the crop, (for we select the very best only for eggs,) 500,000. It requires 100 pairs of cocoons that weigh a pound to produce an ounce of eggs. Consequently, we have 250 ounces, worth at present from \$8 to \$16 per oz., but putting them at the lowest probable wholesale rate, say \$4, they amount to \$1000. Add to this \$150, the value of the cocoons from which the moth has emerged, and \$250, the value of one-half the crop unfit for the production of eggs, and we have in the sum total the handsome sum of \$1350, the result of the labor derived from one hand, six weeks. This may appear at first glance chimerical, but when we take into consideration the pressing demand for eggs for export to countries where they must have them, and that California is about the only place where they can be obtained, it can be seen at once that this is no fancy sketch. It is practicable to feed a limited quantity of worms upon Mulberry plants, the first year from cutting, so rapid is the growth of the tree in this soil and climate. Here we have an industry within the reach of our small farmers, which can be prosecuted without any detriment to the ordinary course of farming.

We fear no competition, for our market for silk is the whole world. And if all the farmers of California could enter into this business within one year, it is my opinion it would not lower the price of raw silk one cent per pound.

With a general dissemination of the knowledge of the advantages of this as a silk-growing country, it is evident that in a very few years the State of California will rank with any of the silk-growing countries of the world.

RIVER AND POND MUD FOR TOP-DRESSING.

We recently visited a luxuriant pasture in the Valley of the Bronx, and supposed from the appearance of the grass it had been recently laid down, or dressed with stable manure. On inquiry we found it had been well covered with pond mud from the adjacent river two summers before. The owner informed us that it was once a poor pasture with plenty of wild carrots and other weeds, and little grass. The summer was dry, and he drew off his mill pond, and carted out the deposits of mud, and spread them. The land had not been plowed or seeded. He

thought it would cut over two tons of hay to the acre, if he did not prefer grazing it. The mud was not seasoned, but was drawn directly from the river bed and spread upon the land. Pond mud seems to act more immediately upon the grass than muck or peat. It is frequently made up of the wash of cultivated fields, and of decayed leaves. There are nooks and eddies along almost every stream where this article collects. Pond mud is an excellent top-dressing for grass lands and should be saved.

Measurement of Farm Land.

It is seldom necessary for a farmer's measurements of his land to be perfectly exact. He generally can pace it near enough for his common uses, that is, near enough for estimating the amount of seed, manure, etc., he needs per acre, the length of fence he needs to provide for, etc. It is, however, very much more satisfactory, and usually more profitable, to measure and know much more nearly the size of the pieces of land cultivated. The measuring rod and tape are nearly as important to the careful farmer as the scales and half-bushel measure. It takes two men, or a man and a boy at least, to carry a chain or tape line, and a farmer is often loth to take off his hands from important work, while he is very willing to spend time in walking over his fields measuring and planning for improvements, and for future crops, or estimating the yield of crops already garnered.

William Hull, of Hill-top, Pa., saves himself trouble by the little contrivance which we figure, and of which he writes as follows:

"Take two strips of board, three quarters of an inch thick, an inch wide, and 5½ feet long, fasten the tops together with a screw, or with shingle nails, spread the bottoms exactly 5½ feet apart, and nail a strip across about 2 feet from the top, and you have a pair of rough compasses or dividers. Point the bottoms, and it is ready for use. Put your hand on top, and turn it as you walk along; three spaces will make a rod. I find it saves a great deal of guess-work."

It must be borne in mind that this instrument will give but very little more accurate results than pacing unless it be moved in a direct line. It is hard even to walk in a straight line unless one has practice, and still harder would it be to carry such a measuring implement. Two points must always be taken, one near and one distant, and the near one be made to cover or half cover the distant one all the time. Thus a line will be very nearly straight. This affair, and the difficulties attendant upon its use, suggests another implement on the same principle, which the writer intends soon to make, thus: Take three sticks exactly 5½ feet long, bore a gimlet hole in the exact middle of each, and fasten them together with a long screw or bolt which shall pass through the ends of two similar sticks, (they should be ¾-inch pine, 2 inches wide.) The three which are fastened together at their centres should now have their extremities placed equally distant. They will be exactly 2½ feet apart, and should be fastened so by means of strips of lath, nailed on six or eight inches from the ends. These are then to be sharpened to marked points just 2½ feet apart, and when done, we have a wheel which will measure one rod at each revolution, and may be pushed before one walking, using the two outside pieces as handles of a wheelbarrow as used.

The Wild Goose.

We have the pleasure of presenting in illustration of this article an unusually fine representation of the Wild Goose, which is the most widely disseminated and best known, perhaps, of our large water fowls. It is a bird of striking beauty, both on account of its brilliancy of plumage and its grace upon the water. On land it is, like the common goose, dignifiedly awkward; but this awkwardness never degenerates into that blundering ungainliness which makes the domestic species a by-word. The common goose is no fool, but only a blunderer. The wild goose is not only intelligent beyond what we should expect, but apparently philosophical; this is shown in many ways. Almost every one is familiar with the order in which a flock arrange themselves for a long flight. The most powerful gander is the leader, and cleaves the air, while the others follow in his wake, usually in two files like a \succ , one leg being frequently longer than the other; and frequently, also, the whole flock, if it be a small one, arrange themselves in a single file. When a change of level, fright, weariness, or any cause, effects an irregularity in their flight, uttering a few warnings and answering "honks," they rearrange themselves and dress their ranks, like a platoon of soldiers by the elbow touch. It is thus that the wild geese make their semi-annual migrations to and from the northern portions of the Continent, where they spend the summer and breed, and the swamps and lagoons of the Southern States, where they winter. These migrations are made earlier or later each year, according to the prevailing temperature of the season. The flight of wild geese northward, in considerable numbers, is regarded by the weather-wise ones as an infallible harbinger of settled warm or warmer weather; and their southward flight is soon followed by wintry weather. Sometimes they are caught in the spring making a mistake, and by some means they become aware of it hours before a cold storm, and re-

treat. When they are seen flying South in good order in the spring, look out for a cold snap. The wild geese which follow up the Atlantic coast in the spring and return by the same route are rather slyer than those of the Interior. They are, besides, rarely so fine and fat in the autumn.

WILD GEES.—(*Bernicula Canadensis*.)

Their flavor is different, also, from the peculiar kinds of food they get. A Western wild gosling is one of the most delicious game birds imaginable. It is esteemed by amateurs superior to the Canvas-back duck, and it is, of course, much larger. The markings are exceedingly uniform, and the ganders are distinguishable from the geese only by a little greater brilliancy of plumage. The head, neck, bill, legs, and

body smoky brown, the edges of the feathers being lighter, shading off rather abruptly from the back, and growing grayish towards the belly; tail feathers black; flight feathers dark, blackish-brown. Length of the bird about 35 inches. Total length to end of tail 43 inches;

widest extent of wings 65 inches. The naturalist Wilson says, and most writers follow him, that "the flight of the wild goose is heavy and laborious." We think, on the contrary, it is easy and rapid. If a flock passes over very near an observer, he will be convinced of the great speed at which they fly. Seen at a distance, we judge of their rapidity and ease of flight by the time it takes them to pass their own length, and forget that a wherry will go its length a dozen times, perhaps,

while a great ship moves its own, and yet the ship may go twelve times as fast as the row-boat. The power of the wild goose may be judged by the ease with which it will lift its ponderous body, weighing 8 to 12 pounds, and often more, from either the earth or the water.

The nest of this goose is usually somewhat concealed, or protected from the winds, and from sight, by rushes or other plants. It is built

up several inches high, of leaves, grass, rushes, etc.; it is large and flat, and located near the water. They are occasionally found within the limits of the United States, but this is probably rather accidental than natural. The perfect domestication of the wild goose has, we believe, never been accomplished, certainly not in this country. The instinct to migrate is so strong that though perfectly tame, and having been for months quiet, orderly tenants of the poultry yard, they either

MUSK DUCK.—(*Cairina moschata*).—See next page.

feet, of the wild goose are black; a triangular patch of pure white extends from under the throat and upon the cheeks, ending in a point on a line with and back of the eye on each side; a few white feathers, more or less, may be seen under the eye. The under parts of the body are light gray, with a tinge of purple, (especially on the breast,) passing into white towards the tail, and under the wings; upper parts of the

take flight of themselves, or will join a flock of wild geese that are flying over. These are often called down by the tame ones, and captured or shot. It is necessary to "pinion" the latter; that is, to remove the end of one wing at the last joint. Being therefore unable to fly, they become quiet and domestic, but their young require the same treatment from generation to generation. Audubon says that in the wild

state they rarely lay more than 6 or 7 eggs, while domesticated ones lay 10 or 11. Like other geese they breed in pairs, and a lone gander will often, perhaps always, mate with a tame goose, if one be presented. The progeny of this cross is a hybrid, or "mule," and unfertile. It is, however, a magnificent bird, somewhat resembling its sire in plumage, but the colors are duller and vary considerably. These hybrids are larger than either parent, very fine eating, and under the name of "mongrel geese" bring a great price in the market.

The Musk Duck.

The Musk or Muscovy Duck, (*Cairina moschata*) is a native of South America, but a frequent denizen of our poultry yards. The most noticeable peculiarity of the species is the great difference in size between the sexes. The ducks weigh from four to five and a half pounds, and the drakes just about twice as much. The ducks closely resemble common ducks of the same colors, differing chiefly in the greater length of the body, and in a smaller amount of carunculated flesh upon the head, and at the base of the bill. In the drakes this bloody-red, irregular mass of flesh extends from the bill over the eyes, and covers the cheeks more or less. They are of various colors, from a blue-black, with rainbow iridescence, passing through all shades of bluish-slate color, and all degrees of pidedness, to pure white. Yellowish-brown and white ducks also occur. Those breeding pure white are most highly prized as a matter of fancy. They are fair layers. The eggs are of a grayish-white color and not larger than those of common ducks. The duck sits about five weeks, and the young are hardly if not hatched until settled warm weather. The name "Musk" is derived from the scent of the oil secreted in a gland upon the rump of the drake. The appellation "Muscovy," as if they came from Russia, is a corruption. The drakes associate readily with common ducks, and the hybrid produced is a large, fine bird, superior for the table, and easily fattened, but incapable of breeding.

The engravings of these ducks, and also of the wild geese on the preceding page, are portraits by Herrick of specimens in the possession of Mr. Stark, of Manchester, New Hampshire.

Walks and Talks on the Farm—No. 60.

The knolls on my farm are full of stones, and I have determined to get them out. They were put there upon purpose to be got out. Darwin ridicules such an idea. (*Animals and Plants under Domestication*. Vol. II, p. 515.) But then Darwin never cleared up land, probably never dug many underdrains, and does not know what glorious fun it is to get out stones. I pity the farmer who does not feel and know that the earth was made for man, and that when his plow strikes a stone it is evidence that that stone was put there to be got out. It was not put there to knock a guard off the reaper, or break a plow point, or batter the harrow teeth, or smash a cultivator; it was put there to be got out. Let this idea once enter a man's mind and grow there, let it be strengthened by his own growth, and by his experience and observation, and it will be of no use to tell such a man that "that stone can't be got out." He knows better. He knows it was put there upon purpose to be got out, and he can do it. For forty years the knolls on my farm have been scratched over. You cannot plow a rod without striking a stone. Consequently

the land is not half worked, and does not produce half a crop. Of course everything cannot be done at once, and the early settlers had enough other work to do without getting out stones. But now the old rail fences are decaying, and it is time to get out the stones and lay wall. I have done only a little of this work, and feel all the enthusiasm of a beginner. It is not half the labor I expected. We attacked the worst knoll on the farm first. There was about a quarter of an acre. We plowed round it, turning the furrows down hill. We soon struck a stone, and got it out by the aid of crow-bars, but not before the plow had struck two or three more. Some of these were large, and we had to dig round them; but they were all got out, and the plow again started, but had not gone two yards before it grazed another two or three inches below the surface. "It's a big un," said Conrad, "and won't do any harm." "We will have it out, nevertheless," I said, while the expression on the men's faces showed that they "guessed he'd soon get tired of this kind o' work." And it did look a little discouraging. But I have not had five years' experience of a pretty rough kind of farm life for nothing. My faith in brain and muscle is strong, and I have never yet undertaken to do anything that *ought to be done* without finding, sooner or later, a way of doing it. It was so with these stones. After going round once, we went round again in the same furrow as deep as we could get in the plow. The wider and deeper the furrow, the easier is it to get out the stones. Good-sized stones, by taking a little pains, could be rolled out,—it being down hill,—with the plow. And this gave me a new idea. "Here's another," called out Conrad. "Wait a minute," I said, "try it with the plow." "It's too big." But the horses stirred it. "Try again, and I will help with the crow-bar." A good pull and out it came. Conrad laughed, shook his head, and said we should break the plow. It was a steel plow, with a steel point, and I knew from experience would stand pretty hard usage. We proceeded in this way, men and horses getting more confidence. There were two men besides Conrad and myself. I had a strong, narrow underdraining spade, and I soon found that it was far better than a crow-bar for getting out stones. It carries its own "bate" or fulcrum. With this spade Conrad and I could plow out stones weighing three, four, or five hundred pounds. When we struck one that was too much for us, we called for more help, and we found comparatively few that we could not get out at once with the plow, aided by the spade and a couple of crow-bars. We let the horses pull just as hard as if they had been hitched to a chain round the stone. It was not long before the men were unwilling to do much at a stone before seeing what the horses could do with it. We got out stones that it was all that four horses could do to draw away on a stone-boat. These, of course, gave us a little more trouble. We had to dig under them so as to get in a long lever. With this, and with the aid of the horses, crow-bars, etc., we succeeded in getting them out in less time, it seems to me, than we could have attached the hooks of a stump-puller to them. We got them all out without breaking a single thing. The main strain is on the point of the plow, and we found it necessary to watch the bolt, to see that the nut was screwed up tight. I question if there is any more danger of breaking the plow in this way than there is in striking a large stone when the horses are moving on at a fair rate in plowing. The one is a blow, and the

other merely a steady pull. I feel as much elated at getting the stones out of this hill as Tim Bunker did at knocking the bottom out of Jake Frink's horse-pond. Instead of an inch or two, we can now plow a foot deep, and it turns up like a garden. The soil round these limestone is always rich, and I expect to see some tall barley on this knoll next summer. As soon as I have earned another holiday we will go at the next knoll, and pile up the stones so as to draw them away in the winter.

One of the best breeders of Short-horns in England is a lady—Lady Pigot of Branches Park, Newmarket. She has just issued a catalogue of her herd, and prefaces it with some very sprightly and sensible remarks. She says: "I know that some breeders have laughed at my making such a point of the milking properties of a cow, but I am certain that we shall eventually have to consider this as the next step in which we must improve our cattle." There can be little doubt on this point. We want cows that are good at the pail, and that will fatten rapidly when dry. The two qualities are not inconsistent. We often have Short-horns that will fatten easily, but will give little milk, but do we ever have a well-bred Short-horn capable of giving large quantities of rich milk, yet which will not fatten rapidly when dry? And if so, why? Will not the steers from such a cow fatten just as well as from one that is a poor milker? A good milker must have a mild eye, a quiet disposition, good constitution, splendid digestion, and be a large eater. The latter is absolutely essential. I have never yet seen or heard of a great milker that was not a great eater. It must be so. She cannot make rich milk out of air and water. As well expect a mill to turn out large quantities of flour without supplying it with grain. And the same is true of a fattening animal. The qualities named are just as essential for a fattening steer as for a milch cow. Lady P. says: "That a propensity to milk well is traceable through a whole family no one can doubt who has been at the trouble of noticing, even in one limited herd, what differences there are as to one tribe being always good for the pail, the other just the reverse; and when we see farmers prefer the great, coarse, half-bred bull for his herd of dairy stock, rather than give a trifle more for a smaller, but purer bred beast, can we wonder at the scores of slow-growing mongrels that frequent our fairs and markets! But to go a step further—do farmers, as a rule, ask what sort of a milker the dam, grand dam, etc., was of the bull they are about to buy? Scidom, if ever. At the auction of the late Mr. J. Cloun's herd, last year, two miles distant, a friend of mine heard a farmer say, when a non-pedigreed cow was brought into the ring, 'Ah, them's the sort, none o' yer high-fashioned stock for me; I likes 'em with constitutions, and black noses, and crumpled-up horns;' and he actually bid for and got the ugly thing, though the pedigree cow, just before sold, was a neat, compact little cow and a great milker, and both went within a pound one of the other! So much for the ordinary farmer's sagacity! But we have men of great intelligence and powers of appreciation, though certainly, in my humble judgment, not many of them are to be found in Suffolk." That is good for a lady.

Here is another specimen of her style of writing: "Victoria Regia is a marvellous breeder; 500 guineas was given for her dam, Victoria, in 1800, and when Ward brought home my new, unseen purchase, he gravely shook his head. 'She's just a neat little cow, but—500 guineas

and the journey money—well, well! to be sure her ladyship knows best! Ward evidently begrudged the money. Victoria bred V. Regia, V. Rubra, and Prince Victor, and died of inflammation of the lungs a week after the latter's birth. V. Rubra also died; and the non-lovers of Short-horns were delighted! How they twitted me with their remarks as to the "risk," "unprofitableness," and "absurdity" of giving such "wicked prices." Their condolences savored more of sarcasm than sympathy, but I went on my way. And I now affirm that Victoria was the cheapest purchase I ever made."

—Lady Pigot has sold of the produce of this remarkable cow about \$14,000 worth of stock.

I never have believed that ordinary farmers with limited capital and with no special aptitude or taste for the business should undertake to raise thoroughbred animals. This is the work of the professional breeder. But there can be no doubt of one thing,—every farmer should make it a rule never to use anything but thoroughbred, pedigreed males. No matter how good a grade animal may be, he has not half the force to impress his qualities on his offspring that is possessed by the thoroughbred. How few farmers seem to understand this matter!

If I was going to seed down a piece of new land for permanent grass—that is, land which had never been cropped, I would be very careful not to crop it. If rough and weedy, instead of planting it to corn, summer-fallow it. You have then a good opportunity to level and clear it. Plow it up the fall previous, the earlier the better, in order that the old sod and rubbish may have time to rot. If the land is liable to be overflowed, or there is not fall for anything except surface drainage, be careful to make numerous dead furrows, and in such a way that the water will pass off quickly in the spring. When dry enough in the spring, plow again, if the sod is sufficiently rotted. If not, cultivate or harrow the surface, and keep down every sign of vegetation. In such circumstances the sod will rot very fast, especially in warm weather. Then plow again, and in such a manner as to level the land as much as possible. Use a dirt scraper, if necessary, to fill up the hollows caused by trees that were blown down. As a general rule, this will not be necessary. Make the land loose and mellow, and a good cultivator passed over the hillocks two or three times in different directions will level them and fill up the hollows. Keep working the land until the middle of August, and then seed it down with a peck to half a bushel of Timothy seed per acre, and as many other varieties of good grass seed as you can get—and the next July will bring you a grand crop of Timothy hay, and the aftermath will afford such rich pasturage that the cows will make more butter and cheese than they did in June on the best of ordinary pastures. We can afford to summer-fallow for grass as well as we can for wheat. Why not? A crop of good grass-pays better than two crops of poor wheat. There is nothing more important in agriculture than rich grass. I do not mean simply a large crop of grass, but grass of the highest quality. If we could get as much nutriment in one ton of grass as we usually do in two tons, the one ton would be worth three tons. I fear I do not make myself understood. Supposing a cow eats 100 lbs. of grass a day, and makes 1 lb. of butter, we may assume that 75 lbs. of the grass is used to sustain the vital functions, and 25 lbs. to make butter. Let the cow eat and digest 125 lbs. of grass, and we should get 1½ lb. of butter a day. If she could

eat and digest 150 lbs. we should get 2½ lbs. of butter a day. But this cannot be done. The stomach will not hold it, and the only way we accomplish the object is by supplying a little concentrated, highly nutritive food, such as corn or pea meal. The grass will furnish a given amount of nutriment at a much cheaper rate than it can be attained in grain. And the reason we can afford to feed grain to cows is simply because we can thus get them to eat 25 per cent more food, and thus get 100 per cent more butter—or if 50 per cent more food, 300 per cent more butter. And it follows from these figures (which, of course, are hypothetical), that if we could make our grass 25 per cent richer we should make it twice as valuable, or if 50 per cent better, three times as valuable. In other words, one ton would be worth as much as three, while in point of fact it only contains as much nutriment as a ton and a half.

Now, I do not say that summer-fallowing an old pasture that has never been cropped will do this, but it will certainly produce richer grass than if the land was planted to corn and afterwards sown down with oats. These grain crops rob the land of the very things that we need to make rich grass.

Farmers are making a great mistake in slaughtering their sheep. But nothing will stop them. It is a pity we cannot have more stability and fixedness of purpose in our agriculture. What we do we should do well—and stick to it. A farmer should think for himself, and not be influenced too much by outside opinion. "You cannot make anything by raising common crops," said a friend a year ago; "you should set out a hop-yard." What would he say now? There has been more money lost in hops the last year than would richly endow an agricultural college. And if people were educated to think they would have foreseen such a result. The fact is that common crops pay better now than anything else, provided you can only raise enough of them per acre. Stick to what you understand, and let those who have a fancy for novelties try them. There are enough farmers, so called, who wish to make money easily and rapidly, without you and me adding to the number.

I do not mean that one should always follow in the beaten track; we should make constant efforts to improve our processes. I think I hit on a good idea in summer-fallowing for spring barley. As yet I have plowed the field but once, but I have been through it twice with the cultivator, and it is now in splendid condition. The sod is nearly all rotted. Before winter sets in I shall plow deep, and then merely cultivate before sowing barley in the spring. I use four horses abreast on the cultivator, and put it in as deep as the land was plowed, and in some places it goes in a little deeper. A man can drive four horses as easily as two, and there is no trouble in attaching them to the cultivator.

EVENER, ETC., FOR TWO PAIRS OF HORSES.

All that you want is an evener and a couple of extra clevises. We made an evener out of a two-inch plank, eight feet long, ten inches wide in the centre, and tapering to six inches at the end. It is one of the most useful things on the farm. Why strain a span of horses in drawing a stone, with another team standing near, doing nothing, when a simple thing of this kind would enable us to put on the four horses and draw the load

with ease? There is no extra rigging required.

I have cultivated the corn stubble twice this fall, and shall go over it again if the weather is dry enough. A two-horse cultivator on a large farm is an absurdity. It does not go deep enough, or wide enough, or if it does it is "a regular horse killer." Put on four horses, and it becomes an exceedingly effective implement.

I sold my hogs the first of October for 19 cents per lb., live weight, the drover wanting them, he said, to "top off" a car load. And yet these pigs have had nothing but the run of the yard last winter, with a little corn meal for a week or two in spring, until the clover got fairly started. Since then they have had nothing but clover, and a little sour milk and wash from the house. It would, of course, have paid well to have given them a little meal with the wash, but I was short of corn, and expected low prices for pigs this fall. On the whole, however, they did well on the grass. They had plenty of it. They were grade Essex, and of course had splendid appetites. A hog that will not eat well is not worth keeping. They are light-boned pigs, with little offal, and never squeal, and nearly all they eat, over and above what is needed to sustain the vital functions, goes to make good, solid pork—and they will eat a good deal. If a farmer will but use thoroughbred males, I do not care which particular breed he selects, so that it is one which has been what Darwin calls "ennobled." He must be pure, without alloy for several generations. Then cross this refined, high-bred, "noble," and, if you will, somewhat delicate animal, on a large, coarse, vigorous, common sow, that has never been starved, on the one hand, nor pampered, on the other, and you will get little pigs that are "perfect beauties," and which will grow rapidly and fatten at any age desired. Such cross-bred pigs will outgrow the thoroughbreds. But of course that is the end of them. The extensive diffusion of the Chester Co. pigs during the past dozen years has made it not difficult to find the right kind of sows for the purpose of crossing with any of the established breeds—such as the Suffolk, Berkshire, Essex, or Yorkshire.

We may argue as much as we please against the use of pork, it will continue to be the favorite animal food with all persons who perform much hard, out-door work, especially in our cold winters. One pound of fat is equivalent, as a heat producer, to two and a half lbs. of starch or sugar, and so far as this is the object of eating animal food, good, firm pork is the cheapest meat that we can use. But a farmer who uses his brain as well as his muscle needs something more than fat pork. For what sin is he who raises it denied the use of beef, or mutton, or poultry? In the summer, without an ice house, it is difficult to keep fresh meat. Not so in the winter. "But I can't afford it." Nonsense. But if it were true, it would only prove that you do not work as hard or as intelligently as a farmer should. If you spend two or three hours of these short days talking at the corners, it is perhaps true that you cannot afford to eat beef. You do not deserve salt pork. Two hours' work will pay for a good beefsteak, and that, properly cooked, will enable you to work harder, and to think as well as work,—and it is thoughtful work that sells. At any rate a farmer can have mutton when a pretty good sheep can be bought for \$1.75, and the pelt worth more than half the money. When thousands of sheep are boiled down for the tallow, and the rest fed to swine, the farmer who

sells them might, one would think, afford to eat a little mutton occasionally, and the children, instead of rye coffee, might have a ba-in of soup for breakfast that would send them on the run to school these zero mornings puffing and blowing off steam like a locomotive. The *Agriculturist* some time since published a good recipe for making mutton soup. You kill the sheep, and cut it up for her, and I will guarantee that your wife, if she follows the recipe, will make a soup that the most inveterate hater of mutton cannot help but pronounce excellent. It is, in fact, exceedingly palatable, exceedingly nutritious, and exceedingly cheap. Such a soup would go far to supply the need which leads to a desire for malt liquors and other stimulants. Our temperance friends should take the hint. Good cooks may do much to arrest this sad habit of drinking. I think it was Henry Ward Beecher who said that "one loaf of bread to a poor, famishing family, would do them more good than two sermons."

About Stone-Boats.

On a stony farm a stone-boat is almost as much of a necessity as a plow, and the description of how to make a good one will have little

Fig. 1.—STONE-BOAT.

of novelty to many of the readers of the *Agriculturist*. A stone-boat, or "stone-drag," as it is frequently called, must be of hard, durable wood, as it cannot be protected by paint, nor shod with iron. The paint would soon be worn and bruised off, and the iron would make too much friction in dragging over stones and earth. White oak is probably the best wood. Three 10-inch or two 15-inch planks, 2½ inches thick, should be got out, for one boat. It is best to select one or two large logs with natural bends in them, so that they can be sawed without waste, and have them sawed about 6 feet straight and one foot at a slight angle—the bend being about 3 inches in the foot. The planks are laid together and connected by means of oak raves. The front and rear raves which cross the planks may be considerably wider than the side raves, if 5 or 6 inches wide and 2 inches thick, they will be strong enough. The side

Fig. 2.

raves should be about 3 inches in width. These are pinned on with oak pegs or treenails (trunnels), which are driven two in each plank, at the ends, and slanting slightly different ways so as to "tie" or "draw," and the more the planks are wrenched, if well "tied," the snug-

ger will the pins draw. The rave in some cases is carried across the front end or "bow" of the boat, but the arrangement shown in the engraving is much better. Fig. 2 shows the way in which the chain may be attached, passing through a hole made obliquely in the center plank. A modification of this boat, which may be very convenient under some circumstances, has both ends like the front end of the one shown in fig. 1. This end may be left square, as the planks are sawed, but the rounding and chamfering of the edges is an improvement.

Male Breeding-Animals.

The good of every individual, man, woman, and child, in the State would be as directly affected by an improvement in our breeding stock as in any other increase in our productive industries or great internal improvement. It is the business of the State to foster industries, and to carry out or promote improvements. Now, there is not a State in the Union in which there are not five, if we may not say ten, poor bulls, stallions, boars, and rams, to one tolerably good one. If in a dairy region only thoroughbred bulls were used, farmers would soon get in the way of using only those of good dairy breeds, and

we venture to say that the yield of milk would be increased on an average 2 quarts per day during the milking season. With 50 cows this would make 24,000 quarts, worth, at 8 cents per quart, \$270, which is clear gain to the farmer, and so much more taxable property in the community. It becomes a question of no little importance for Agricultural Societies, Boards of Agriculture, and the legislators of the various States to discuss, if by encouragement or taxation they may not be able to effect some such change.

Suppose, for instance, that a State should tax all bulls twenty dollars a head, and allow the officers of the State Board of Agriculture to remit the tax on all which came up to a certain standard of excellence. How long would it be before an essential change would be observed in the whole character of our neat stock and dairy products? It is certainly a question of great interest, how the State may best secure the advantage to accrue both to its treasury and to its citizens by the general use of well-bred or thoroughbred male animals as sires.

How a Fowl May Live without a Head.

A "Headless Rooster" has been exhibited in New York and other cities, with a great flourish of show-bills, in which the bird is advertised as a phenomenon "defying explanation by any known laws of nature." One of our associates examined the bird as far as the surliness of the proprietor would allow him to do so, and made up the subjoined account of the matter as it appeared to him. The article has been in type several months, it having been crowded aside by other matter. The "Headless Rooster" man has recently been arrested under the law to prevent cruelty to animals, and the complaint shows that the operation was precisely of the character described below. The complaint also sets forth that the prisoner

was in "the constant habit of performing said practice on roosters, which he sells for public exhibitions, and that said roosters, after having said operation performed, live in pain and torture for periods from between one week and two months, when the same languish and die."

In fig. 1 the bird is represented as he stands on exhibition. His attitude is that of perfect unconsciousness. He stands in a semi-couched position, with his plumage slightly raised, which gives him a plumpness and roundness unnatural in health. He will stand in this position for hours unless disturbed, and when aroused will simply move a step or two, and again settle down as if nothing had happened, apparently forgetting that he had been disturbed. The sense of hearing has not been lost, and at the

Fig. 1.—HEADLESS FOWL.

report of a pistol shot he will start up, move his neck around, and almost instantly settle again into the same listless, senseless state. He will swallow food when placed in his throat by his attendant, and life is maintained in this way.

To show how a bird may live with a portion of its brain removed, we must explain the structure of that organ. The brain, instead of being one mass of solid, nervous matter, as is commonly supposed, is really composed of several collections, separated more or less by bony partitions. Figure 2 represents the head of a rooster cut longitudinally in such a way as to show the brain in its place, and the internal bony structure of the skull. The diagram, fig. 3, will show the divisions more plainly. The olfactory center, figures 2 and 3, a, placed in front, sends its nerves to the internal nose and governs the sense of smell. The cerebrum, b, or what is commonly considered the brain proper,

Fig. 2.—SECTION OF HEAD.

is the seat of intelligence and reason, and is the largest of all the divisions. The cerebellum, c, is situated behind all the other divisions of the brain, and is next in size in most animals to the cerebrum. This is said to preside over what is called associate action, that is, that peculiar coöperation of action in the muscles which

enables the animal to perform all ordinary movements of the body, such as standing erect, walking, etc. In front of the cerebrum and in the natural position of things partly covered by it, are the *optic-tubercles*, *d*, or the centers governing the sense of sight, and in far-seeing animals, such as birds, they are comparatively large.

Lastly, at the top of the spinal cord, and at the very base of the skull, we have the *medulla-oblongata*, *e*, which

Fig. 3.

governs the function of breathing, the digestion of food, and all muscular power. All the nerves coming from the muscles of the body and forming the spinal cord have to pass

through this portion before reaching the other parts of the brain. The slightest injury to this part oftentimes results in instant death, so that it has received the name of the "vital-point," or the "vital-knot." Experiments have shown that all the other parts of the brain except this last, the medulla-oblongata, may be injured or even removed, without the immediate destruction of life, but as soon as this is disturbed, breathing at once stops, the heart's action soon ceases, and death is the result. The injury the rooster on exhibition has sustained seems to be this. The head, or rather the face, has been so taken off as to leave behind, uninjured, the three last named parts of the brain, *c, d, e*, which are the ones really essential to the maintenance of life. If a bird's head be cut in the direction indicated by the dotted line, *h, i*, fig. 2, it will only have lost its face and the external appendages thereto, and the intellectual part of the brain, the cerebrum, leaving behind the parts essential to the life of the animal. Though apparently headless, there is still enough of the brain left to allow the animal to perform certain functions, for a while at least.

Clearing Woodland.

In adapting woodland to ornamental purposes, and in some other cases, it becomes necessary to remove the whole, or a part of the trees. In doing this, it is often better to remove the trees with the main roots, rather than to fell them in the usual manner and take the stumps out afterwards. The leverage is very great in a tall tree, and the stoutest one can be turned out with a yoke of cattle. The best tool for cutting the large roots of trees is the common mattock or grub-axe. It has a long, thin blade, with a much narrower cutting edge than the common axe, which is of great advantage in cutting roots imbedded in the earth. With this, one gives a more powerful blow, and it is less liable to get dulled. After the roots are cut, a rope may be attached to the tree and hitched directly to the yoke, if the tree is small, or passed through a pulley fastened to the ground. The higher up the tree the rope is fastened, the greater is the purchase upon the roots. After cutting up, the trees, roots and all, can be drawn into heaps, and burned. Where the wood is so near market as to be valuable for timber, there is an additional motive for this mode of extracting roots, in the fact that with the hole they can be made into ship knees. Large quantities of larch and spruce knees of this kind are brought from the forests of Maine, and sold at good prices to our ship builders. Material for ship building is constantly appreciating in value, and knees are now

sent hundreds of miles to market by water and by rail. The knees, if well sold, would often pay a good part of the expense of grubbing the trees. If the trees are already cut in the ordinary way, with the stump standing, nothing remains but to apply some kind of a stump puller.

Hickory Nuts and Timber.

The Shagbark Hickory is a favorite tree with us and with every northern farmer, so far as we know. It is very handsome, and of rather quick growth; the foliage is beautiful in its rich, glowing greenness, and little subject to injury from insects, though, with all the rest of our forest trees, the hickory is attacked by several. The

Fig. 1.—HICKORY NUTS.

tree is perfectly hardy, requiring a good soil, enjoying moist grounds, yet doing well wherever its roots can penetrate to a permanent water supply, or into deep loamy or rocky soils, which are always somewhat moist. The fruit is the most delicious of our native nuts, in the estimation of most people, and the mere mention of the wood recalls grateful memories of hearthstones, where the genial blaze of the hickory logs in the great fire-place was as much a part of the winter evening welcome as the cordial hand-grasp. The belief is a common one, that the days of open wood fires are numbered, and that the bright, warm, hickory blaze must give place to red-hot anthracite and black stoves. We do not entertain such an opinion. With only a little painstaking we can have hickories enough, which will pay an interest on the ground they occupy with fruit and shade and beauty, and at last give us fuel for our open fires, handles for hammers and axes, flails, ox bows, hoop poles, spokes for wheels, teeth for rakes, and tough, elastic wood for purposes wherever these qualities are desirable.

There is almost as much difference between the nuts of Shagbark hickories as there is between apples. This is not alone in size, but in quality—in sweetness, and in the nature and thinness of the shells. The character of the shell is very important. We all know that some nuts crack so that the halves of the irregular kernel drop out almost or quite whole, or are picked out without difficulty. This quality is peculiar to nuts of certain trees, and is not altogether dependent upon the thinness of the shells, or the way they are cracked. The good qualities seem to be in some degree associated with the thickness and size of the outer husk, which in the fruit of the Shagbark Hickory (*Carya alba*) falls apart, when ripe, in four segments, leaving the nut free. The thicker the

husk, the better the nut usually. Some thin-husked nuts are very sweet, but the shells are hard, and the nuts usually small. Hickory trees are easily raised from seed; we think as easily as peach trees. The little trees should be transplanted in the nursery rows at a year old, the tap-roots being cut off, and after this they will bear transplanting like other nursery stock. Seeds selected from trees bearing remarkably fine nuts will be very likely to produce fine fruit, provided the parent trees stand isolated from inferior sorts. Cultivation and enrichment of the soil have a marked effect on the size and abundance of the nuts.

We have never known of the hickory being successfully grafted or budded. It is possible, however, to multiply choice trees from the roots.

Mr. A. S. Fuller assures us he has been entirely successful in obtaining young trees by bending up the upper roots, so as to bring a portion to the surface, and wounding this, which causes the formation of shoots upon it. These shoots may be cut off from the parent tree, and as soon as established as independent plants, transplanted. We give an engraving of the fruit of the Shagbark Hickory, fig. 1, and in fig. 2, two nuts, one, the smaller, being the nut of this tree, of exact natural size, and somewhat above the average of good hickory nuts. The larger figure is the nut of the Thick Shellbark Hickory of the West. It is a decidedly

larger and coarser nut, of a yellowish-brown color; the shell is exceedingly thick, but the nuts in some varieties approach very near in excellence to that of the thinner shelled Shagbark. The trees are similar, both in appearance and quality of the wood. The leaves of the thick Shellbark Hickory (*Carya sulcata*) have, however, more frequently 7 or 8 leaflets than 5, which is the common number upon the Shagbark. Much more attention should be given not only to the preservation of the trees already existing, but to the propagation of the hickory, chestnut, and other trees, valuable for both fruit and timber. We believe it is in the power of

Fig. 2.—SHAGBARK.

THICK SHELLBARK.

almost every farmer to have a grove of hickories yielding fruit much superior to the common hickory nuts of the woods, or of the market, and bringing, also, a very much higher price.

Leaves for Bedding.

Gardeners who have occasion to make hot-beds generally appreciate the value of leaves, and gather them if they are available. Farmers, as a rule, with every facility for gathering them, and forests close by, leave them to rot upon the ground. They are not, indeed, quite lost there, but soil that has had hundreds of crops of leaves upon it and is a mass of leaf mold several inches

es deep, will not be immediately benefited by the crop of leaves. Leaves, if gathered, used for bedding, and composted with the manure, will bring valuable returns the next harvest, and show their influence in subsequent crops. We recently visited a farmer who classes forest leaves as one of the best fertilizers afforded by his farm. He gathers large quantities in the fall and early winter, stores them upon the

Fig. 1.—WAGON OR CART RACK FOR LEAVES.

floor above his stables and sties, and through a chute drops them upon the stable floors as they are wanted. Leaves make clean, warm bedding for all his animals, and add to the bulk and value of his compost heap. They furnish remunerative work to his men when the harvests are gathered, and thus are an advantage to laborers. They make good bedding, and thus allow him to sell straw. This is an important item where straw is worth \$15 a ton and upwards. Leaves are somewhat difficult to handle, but if gathered in heaps a week or two before carting they become quite compact, and, with a large basket and rake, are readily loaded upon the cart. A rack, with flaring boards extending about two feet beyond the sides and ends of the cart body, is a very convenient article for carting the leaves. We give an engraving, figure

Fig. 2.—SLED RACK.

1, of a rack in use upon the farm of Reisig & Hexamer, of New Castle, N. Y. The two end boards upon which the rack is built just fit into the wagon box. The rack is made entirely of 4-inch strips of 1½-inch pine, fastened together by cheap iron bolts with nuts, and has a spread of nearly 7 feet. The leaves are loaded and unloaded with dung-forks, and, of course, trodden down as they are thrown into the wagon.

Where the way from the woods to the barnyard lies over grass fields and lanes on which there is but little bare ground and few stones, a rack, or hopper-shaped rack, such as is shown in fig. 2, made to fit a wood-shed sled, will be found very handy, on account of its being so low and easy to load. It is fastened on by low stakes in the place of the ordinary sled stakes.

Rotations for New England and the East.

One great desideratum of Eastern farming is a good system of rotation. It is not desirable to have all farmers adopt any one system, for there are circumstances in the condition of every farmer, which make some one or two crops profitable for him, which would not pay in another district. There are certain characteristics common to New England, New York, and parts of New Jersey and Pennsylvania, which make a rotation desirable for them, which would not be at the West or South. They are dairy regions naturally, and the grasses reach a high degree of excellence there. Hay, under the

system which now prevails, pays as well as any other farm crop. These regions are quite thickly settled, and there is a large city and town population to be supported, making excellent home markets. In such localities the demands of these home markets will very naturally determine the character of the husbandry. We suggest a few rotations which will work well in the districts indicated. No. I, 1st year, corn on sod, heavily manured; 2d, potatoes; 3d, oats, seedling with clover and Timothy; 4th, clover; 5th, 6th, and 7th, Timothy and other grasses in meadow. This is the old-style rotation in New England, but never very rigidly followed. The land frequently lay in meadow six or eight years, long after it ceased to yield remunerative crops. The clover, too, was frequently omitted. No. II, 1st

year, corn on sod heavily manured; 2d, same; 3d, potatoes; 4th, barley; 5th, clover; 6th, 7th, and 8th, Timothy and other grasses. This extra year of corn is employed in lands full of weeds, and the extra manure given the land would probably make another year or two of grass profitable. Land should not be kept in grass where the yield of hay gets essentially below two tons to the acre. It should either be plowed or top-dressed immediately. No. III, 1st year, potatoes on sod, with ashes, plaster, or lime in the hill; 2d, corn heavily manured; 3d, rye; 4th, clover; 5th, 6th, 7th, grass. Where potatoes are put upon sod, the land should be plowed the previous September, so as to give time for the sod to rot. In the spring it should be cross-plowed, to make the seed-bed as mellow as possible. A good, rich soil usually gives a large yield of potatoes without disease. No. IV, 1st year, corn upon sod heavily manured; 2d, oats or barley; 3d, clover; 4th, early potatoes; 5th, winter wheat or rye; 6th, clover; 7th and 8th, grass. In this rotation there are two years of clover, which is desirable for light soils, or for farms a good deal run down. No. V, 1st year, early potatoes on sod; 2d, winter wheat or rye, with manure; 3d, clover; 4th, ruta-bagas; 5th, clover; 6th, 7th, and 8th, grass. Near seaports where there are good facilities for marketing, ruta-bagas are a very profitable crop. The turnip should always have manure, and the concentrated fertilizers applied in the drill have very marked effect. Grass is prominent in all these rotations, for butter making is profitable in all this region, and other animal products of which grass is the basis are high. Clover is always present, for it is the best renovator of the soil from its own resources with which we are acquainted. Potatoes, when they do not rot, pay better than most crops, and we think it quite possible to avoid the rot by selecting new varieties and avoiding fresh manures. Corn pays moderately on a dairy farm if the stover is properly cured, notwithstanding the competition of the West and South. No. VI, a good, heavy soil rotation is as follows: 1st, corn on sod manured; 2d, potatoes with ashes and plaster, or some concentrated fertilizer in the hill; 3d, oats or barley, without manure, seedling with clover, plastered after harvest; 4th, clover plowed under in July after mowing or feeding off in June; 5th, winter wheat with guano, seedling with grass and clover in the spring; 6th, clover; 7th and 8th, grass. If the soil be weedy, three hoed crops in succession would probably pay, thus: No. VII, corn and potatoes as in No. VI, then, 3d year, on light land, white beans; on heavy land subsoiled, roots, (mangels,

or ruta-bagas,) with fine manure and thorough tillage; 4th year, spring grain, followed by, 5th, clover; 6th and 7th, grass; or 5th, clover and wheat sown on the limed sod; 6th, wheat, top-dressed; 7th, clover; 8th and 9th, grass. If potatoes are well cultivated and kept clean, and especially if the land be pretty free from weeds, they may be put on two years running, thus: No. VIII, 1st, potatoes on sod; 2d, potatoes with fine lime, muck, and bone-lust compost; 3d, white beans; 4th, rye; 5th, clover; 6th and 7th, grass. This rotation is especially adapted to a rather thin, gravelly soil, not retentive of manure. We offer these rotations to stimulate the thoughts of our readers, and to lead them to devise the system adapted to their peculiar wants.

Potatoes on Clover Sod.

We tried potatoes on a clover sod for the first time this year, and like the results. The land was a heavy, gravelly loam, in good heart, and the clover was turned under the last of April, after it was well started. The piece was immediately planted with the Early Goodrich and Cuzco potatoes, in drills. The crop was hoed twice, as well as the long-continued rains of summer would permit. We anticipated rot, on account of the excessive moisture, but a large crop of sound potatoes was harvested in September. The quality of the Early Goodrich is excellent, and even the Cuzco is a fair table potato. Clover furnishes a large amount of vegetable matter to the soil, keeps it loose and mellow, and is probably quite as good a preparation for potatoes as for wheat. As clover is usually followed by Timothy kept in meadow for several years, this experiment is not often tried. If it will give us a large crop of sound potatoes it will be worthy of general adoption.

A Good Wooden-toothed Harrow.

Wooden harrows are convenient articles on most farms, but almost indispensable on those with light sandy or gravelly soils. They are, so far as we are aware, always home-made, and are usually of the square or "A" forms. The teeth should be not less than an inch and a quarter in diameter, and eight inches long; if needed longer they must be larger. The beams must therefore be strong, or the holes will weaken them. Mr. Sidney Penny, of Suffolk Co., L. I., has had in use for many years a form of

WOODEN-TOOTHED HARROW.

wooden-toothed harrow which he highly commends, and which strikes us as useful, because the teeth are arranged so that the ground is all harrowed twice, which is a better operation than if the same number of teeth passed at once through the soil—that is, in a single rank, as in the common "A" harrow. This makes fewer holes through the outer beams, also, and these

beams, which are subjected to severe strains, are braced at three points instead of two. Besides these advantages, the main beam and brace-beam on each side are hinged together with a pair of strong door hinges. When the barrow is not in use, the hooks which hold the brace-beams in the mortises being undone, and the center tooth and the bolt at the front end removed, the harrow comes in two parts; the beams of each side fold together, and it is laid away, taking up but little space. Among the advantages of wooden-toothed harrows is the compression of the soil which they effect. While they tear up sods and break down the clods quite as effectually as iron-toothed ones, they do not tear out and uncover long manure so badly, and they settle and compact the soil a good deal like a roller or clod crusher. Their work is chiefly on the surface, and they cannot be settled deeply into the soil as can the others. This form cannot carry so many teeth as the square harrow, made with four parallel beams, but labor with it is more economically expended, as a general rule, for it is uniformly the case that, however accurately arranged, the teeth in actual use will follow more or less one in the track of another.

Tim Bunker on the Hay Tedder.

"What sort of a consarn is that, Squire?" asked Jake Frink, one hot day last July, as I drove my new tedder to the field.

"You just come down to the horse-pond lot and I'll show you," I replied. So Jake followed on, where we found at least a dozen of my neighbors standing round to see the last novelty in farming. The field had just been mowed, and though I say it that shouldn't, it was the stoutest grass in Hookertown, plump three ton to the acre of Timothy, just in bloom, upon a lot where water used to stand half the year, and nothing but rushes, hardhack, and sour grasses, ever made a crop. It is astonishing to see how underdraining improves land, and how much more good manure does upon a soil that has had the bottom knocked out of it. Jake Frink groans every time he goes by that horse-pond lot, to think that he sold it for twenty dollars an acre. It pays the interest on three hundred now easy. I had never tried the tedder on so heavy grass, and I felt considerable worried about the result. I started alongside the wall, and the grass flew up in a cloud behind the machine just as if a whirlwind had got hold of it.

"A sort of patent compound grasshopper, ain't it?" said Jake inquiringly, as he noticed the kicking motion of the forks.

"You can't say that's no great shakes," said Seth Twiggs emphatically, as he puffed away at his stump pipe.

"It's a shaky consarn any how," said Uncle Jotham Sparrowgrass, striking the ground with his cane a little harder than common. "It will never amount to any thing, see if it does. Job Miller had a thing a good deal like it thirty year ago, over on the Island. It was too hard on the horse and didn't pay."

"It leaves the grass very light and even," said Deacon Smith. "I shall have to get one." "It must dry very rapidly," Mr. Spooner remarked.

"That's so," responded George Washington Tucker; "but it means less work for poor folks, and harder times. Every new machine drives another nail in their coffins."

"Less work, you lazybones!" exclaimed Seth Twiggs. "It's hard telling how you could do any less and live."

"You may as well put up your stirring sticks and old rakes' tails. You want want 'em any more," said Benjamin Franklin Jones.

"It will cure the hay too quick," said Uncle Jotham. "The sun gets at it so on all sides that the grass will break like a pipe stem."

"The quicker hay is cured, the better," said Deacon Smith. "Two hours are better than two days, if you can get the water out of it."

Nothing has awakened so much interest as the tedder since the subsoil plow was introduced. The times have changed a good deal since then, and the presumption now is that a new tool is good for something, especially if it makes its appearance in my fields. So many of my jobs have turned out well, and so many of my neighbors have imitated my example, that public opinion is very much changed. I had heard and read a good deal about tedders, but never saw one work until this season. I had a good many doubts. The English tedder is a heavy affair, quite likely to get out of repair, and entirely unsuited to our Yankee ways. But the first time I saw one of our sort of tedders I made up my mind to have one. You see, Mr. Editor, it just supplies the last tool we wanted in hay-making. The mower, rake, fork, tedder, all going by horse-power, make haying as light and pleasant as any work upon the farm.

The tedder saves a good deal more work than I had thought for. To begin with, it does the work of at least ten men. You can stir two acres of heavy grass in an hour easy, and it is more thoroughly stirred than it is possible to do it by hand-power. It is sent up into the air with a sudden jerk, that shakes all the water out of it, and it falls back upon the ground so loose that the sunshine can reach every particle. This work is done in the hottest part of the day, and the drying goes on very rapidly. The tedder works so fast that you can go over your field three or four times, if it is necessary, and get heavy grass cured enough to go in the same day it is cut. This is a very great saving of labor. By the old method it frequently takes three days of tolerably good weather to cure heavy grass. The cocks have to be made and opened twice or three times before the hay can go into the barn. Now, with the tedder, we can have the hay all shaken out by eleven o'clock, if it is all mowed by that time, and by keeping it stirred up it is pretty well cured by three in the afternoon, especially if the grass is fully fit to cut. It makes the mowing machine worth a good deal more to us than formerly, for now we can mow all we want to in a fair day, and have no fears but we can get it up. Sometimes we used to get so much down that a part of it would get injured before we could get it secured. One grand thing about the tedder is, that it cures the grass very uniformly. There are no wet, green locks in it, and even if it is not quite cured enough the first day, by leaving the cocks in the field covered with hay caps overnight, they will often be just right to go in the next day without opening. The quicker you can get hay nicely made and out of the sun, the better.

We have had the tedder up for discussion in the Hookertown Club, and it has passed muster, after a pretty severe overhauling. If we keep on inventing new tools, I expect we shall get the farms so that they will run themselves pretty soon. Yours to command,

TIMOTHY BUNKER, ESQ.,

Hookertown, Conn., Oct. 15, 1868.

WHEAT IN ENGLAND.—The Agricultural Gazette estimates the annual consumption of

wheat in the United Kingdom as 20,000,000 of quarters, it may be a million more; and states the average yield per acre, throughout the kingdom, at 27 bushels. An English quarter is 8 bushels.

The Potato Excitement.

When we read the accounts of the enormous prices paid for tulip bulbs in the 17th Century, we think that the stories must be much exaggerated or the people of that time must have been very foolish. The present excitement in regard to new potatoes in a measure rivals that of the tulips—at least we thought so when we were told that \$50 each had been refused for a couple of tubers that we were inspecting. The late Mr. Goodrich began his experiments with unimproved stock from South America, and the Early Rose and other new sorts are derived from Mr. G.'s seedlings. Whoever produces a better potato than we already have is a public benefactor, and if he gives us one which will produce more to the acre, he adds largely to the wealth of the country. It has thus far happened that those who have done most for the improvement of the potato have not been pecuniarily benefited. Mr. Goodrich, it is said, made no money, and we learn that the large sums derived from the sale of the Early Rose went to others than the originator of that variety. The success of the Early Rose has been so very general that new seedlings will doubtless abound, and it is not unlikely that many indifferent ones will be offered at enormous prices. It will be well for those who wish to experiment with new sorts to purchase only of dealers of established reputation. The remarkable specimens above referred to were raised by Mr. Breece, the originator of the Early Rose, but they will not be put upon the market this year. Another seedling by Mr. Gleason, of Mass., and by him esteemed of high quality, is the Willard, sent out by Mr. Gregory, of Marblehead. It is a neat-looking, long potato, of medium size; the skin is red and blotched somewhat like that of the Calico. Mr. Heffron, of Utica, has a seedling from the Early Rose, called the Climax. Those who have tested it speak in high terms of its quality upon the table. It is a white variety with a rough skin and depressed eyes, and has the hardy look that marks most of the Goodrich seedlings. With the new sorts already offered, with others to come, we may anticipate some interesting developments in potato culture.

A Fish-Oil and Guano Factory.

In November of last year (1867) we gave an engraving and description of the Menhaden, or Moss-bunker, with an account of the process of manufacturing the fish into oil and fish-guano. Since then one of our artists has visited one of the most extensive factories, located at Greenport, L. I., and made several spirited sketches, which are presented on the following page. In the article above alluded to will be found a full description of the fish and its products, and we need now only point out what the engravings illustrate. A correspondent at Greenport writes:

"The fish are obtained from fishermen, who either own their own 'rigs' or are part owners with the factorymen, and who receive a certain price per thousand. A rig consists of a yacht, very often a fast sailer and elegantly fitted up; two 'carryaways,' and two seine boats of about the size of an ordinary whale-boat; the gang is composed of eight or nine men, including the captain, who share equally in the profits

of the season's work. The net with which the fish are caught is peculiarly managed—it is about one hundred and ten fathoms in length, and provided with corks on one side and iron rings on

are thus brought near the surface, and loaded on board the "carryaways," to be taken to the factory's dock. At the factory the fish are measured either in cars or boxes, and are drawn

hydraulic press. The oil and the water absorbed by the fish in boiling are pressed out through the slats and carried by leaders to the tanks in the shed by the side of the factory, where the

guano; this substance, being rich in ammonia-producing material, is used by some manufacturers of fertilizers to supply ammonia to phosphates that are deficient in that constituent.

Hardy Apples.—Duchess of Oldenburgh.

After many costly lessons our fruit growers have learned to consider the qualities of the tree as well as those of the fruit. The question is not what is the best fruit, but what is the best we can raise in our climate. With quickly fruiting things, like grapes, the question is soon settled, but it takes years of patient waiting before we can find out if certain varieties of apples are suited to a particular locality. He who

North and North-west to have a list of hardy apples, and we are glad to see that the Indiana Horticultural Society offers premiums for the varieties best suited to northern localities.

The Pratt Pear.

It is worthy of note that our most valued native fruits are chance seedlings.

The Pratt Pear is one of these, and it is also one that deserves to be better known. The writer has seen this pear brought to the Providence market in a farm wagon with no more care than is given to potatoes. People bought the fruit by the peck and thought it excellent to bake, but never supposed that they had one of the choice pears of the country. Some 20 years ago the R. I. Horticultural Society was formed, and it was soon found that the little State was rich in choice fruits. The Pratt Pear, among others, became known to

William Ried said: "I think it will prove one of the best pears we have in New Jersey." Col. Wilder followed with the remark: "If the Pratt was more generally known, it would come into great favor. It must stand in the Catalogue as one of our best." After commendations from such eminent pomologists we need not add a word in praise of the Pratt.

DUCHESS OF OLDENBURGH.

shows that an apple fails, deserves as much credit as he who reports the success of one, as success and failure are due to inherent qualities over which the cultivator has no control. Among the apples which have proved hardy in the North-west, as well as in Northern New England, is the Duchess of Oldenburgh. It has not only hardness of tree but great beauty of fruit to commend it. In a market fruit a showy exterior is of more value than delicacy of flesh and flavor. At the late Ohio State Fair, A. B. Strother, of Hancock Co., O., exhibited a dish of these apples, so strikingly beautiful that we obtained one for illustration. It sometimes does more good to call attention to an old but not generally known fruit than it does to bring out a new one. We regret our inability to give the brilliant colors and the fine bloom. For a description we cannot do better than quote that in American Pomology, by Dr. Warder, who says: "This very beautiful striped apple is from Russia, and has proved one of the hardiest apples in our trying climate. Reports from the North-west are entirely satisfactory as to its hardness. Tree medium size, round-headed, sufficiently vigorous and perfectly hardy; fruit medium, regular, roundish-oblate; surface smooth, waxen-yellow, partially covered with distinct and regular stripes and splashes of brilliant red and carmine, often having a light bloom, such as is found on most Russian apples; basin regular, pretty wide; eye large and closed; cavity regular, acute; stem medium to long, rather slender; flesh white, tender, juicy; sour and suitable for cooking. Though attractive to the eye, it is unsuited for the dessert. By Dr. Jno. A. Kennicott, the pioneer cultivator of Northern Illinois, this apple was considered the *ne plus ultra* for that and higher latitudes."

It is a matter of great importance to the

pomologists through the labors of the above-named Society, and took its place among our best varieties. It seemed like meeting an old friend to find this pear in the experimental garden at Washington, and in the specimen grounds of Ellwanger & Barry, at Rochester. From the last-named collection we took a specimen for our illustration, which we give with the remark that the fruit grows there less pyriform, i. e., shorter, than it does in Rhode Island. The tree is an upright grower, very vigorous, though rather late in coming into bearing. It does not

DUCHESS OF OLDENBURGH—SECTION.

grow well upon quince. The skin of the fruit is greenish-yellow, very thickly dotted with russet, and sometimes shaded with crimson. The flesh is white, remarkably juicy and melting, and with a highly vinous flavor. It is a variable pear and requires careful ripening to develop its best qualities. At the meeting of the American Pomological Society in 1863, the late

PRATT PEAR.

More Quinces Wanted by Planters.

The show of Quinces at the Ohio State Fair was splendid; yet the fruit is not plenty, bringing four dollars a bushel in Ohio, while at the East it is too precious to sell by measure, but is sold by the hundred. Thinking that people were not awake to the value of the Quince, we requested a distinguished pomologist to write up the subject. He replied that the trouble was not with the people, but with the nurserymen; the demand was far in advance of the supply, and so thoroughly was the stock of quince trees in the nurseries reduced that he knew a case in which Angers quince stocks upon which pear buds had failed were used to fill orders for quince trees. Now it does but little good for us to advocate the planting of anything of which a supply cannot be obtained. If the nurserymen will not keep a stock of quince trees, let every one who wishes to plant them turn nurseryman, as far as this goes, and raise them himself. The quince grows readily from cuttings, and it is in many places practicable to plant them yet. Where it is too late to set the cuttings this fall, prepare them for spring planting. Choose good, vigorous shoots, cut them up in pieces of about six inches in length, and tie them in convenient bundles. Bury in the cellar, or pack them in moss, as suggested in the article on calling cuttings in October last. Another way followed by some cultivators is to dip the lower ends of the cuttings in thin mud made of loamy soil, taking care that each one in the bundle is coated for about an inch. These may be set on the cellar floor, or in any cool place where it will not freeze severely. If too dry, sprinkle now and then. The mud prevents the cuttings from drying out, and induces the formation of a callus.

In procuring cuttings take care to get them from good trees. There is much confusion in names. The Apple or Orange variety is generally preferred. Roe's seedling, scarce as yet, is a fine variety.

Native Grapes Under Glass.

It has been generally believed that our native grapes, if they did not deteriorate, at least did not improve by growing them under glass. The results obtained by Mr. Saunders at the Experimental Gardens in Washington show that such is not the case. He has a small house with several native varieties, noticeable among which are the Iona and Adirondac, varieties which from local causes he is unable to fruit in the open air. The structure is of the simplest and cheapest kind. Two board fences, one four feet and the other eight feet high, are set about six feet apart, and roofed over with the cheapest sort of sash. These figures are approximations, as we did not take measurements. The ends are boarded up, wide ventilators covered with wire netting are made in the lower wall, and an arrangement provided for ventilation at the top of the rear wall—if a board fence can be called a wall. The vines are planted outside, and brought into the house, where they are perfectly free from mildew and the attacks of insects and birds. Here was the Adirondac full of fruit, which had a most luscious sweetness, but was without character. The Iona made bunches probably more beautiful than Dr. Grant ever dreamed of, and of a flavor that would be hard to match among the best foreign varieties. The Salem gave us a new idea in grapes, as it possesses, grown in this way, a flavor peculiarly its own. Mr. Saunders informed us that the vines in the house had no care beyond what would have been given out of doors. This experiment is worthy the attention of those who live in high northern localities, as well as those who are in situations where grapes generally fail. A structure of the kind we have described will require but a very small outlay, for which the certainty of obtaining fruit will more than compensate. Mr. Saunders has arrived at the conclusion (with which many will not agree) that the art system of training is a failure, but believes in renewing the vine from as near the root as possible, and fruiting from the upper buds.

A Fungus on Fruit Trees.

The many afflictions which come upon the fruit grower in the form of mildew, rust, blight, curl, etc., have from time to time been ascribed to electricity, atmospheric causes, (whatever they may be,) insects, and fungi. In the last two we have something tangible and capable of investigation. One field, that presented by the insects, is being thoroughly explored by many enthusiastic workers, while the equally important one, the fungi, is in this country well-nigh neglected. The subject is one of great difficulty, and needs the most patient labor. The fungi which prove injurious to our trees are exceedingly minute, and often manifest their presence only after the mischief is done. The popular idea of a fungus is that it is a toad-stool or mushroom. While all toad-stools are fungi, all fungi are not toad-stools; indeed, those which give us the most trouble bear no general resemblance to toad-stools. The toad-stools live upon decaying animal matters, and as they act in a measure as scavengers, they may be considered as useful rather than otherwise, while the microscopic

individuals which produce mildews, blights, rusts, etc., are so small that they can live within the tissues of a leaf, and are only visible to the eye when they break through to the surface to bear seeds, as we may call the minute dust by which they are reproduced. Minute and obscure as they are, these vegetable forms have, like larger plants, been classified and arranged in genera and species. To give an idea of one group of these small fungi, we present engravings of one that has been found very trouble-

Fig. 1.—FUNGUS ON LEAF.

some in the apple orchards of East Tennessee. Upon the upper surfaces of the leaves are discolored spots, which upon the under side of the leaf appear as in figure 1, and look very much like some forms of skin disease in the human subject. There is an elevated, more or less regular, ring surrounding a discolored spot. Upon magnifying these spots, that which appeared to the eye as a disease becomes a structure of great beauty. The ring is made up of minute cylinders; the mouth of each is handsomely fringed with long, transparent hairs. One of these is shown in figure 2 very much enlarged. Fungi presenting this general appearance are called "Cluster-cups." Within the cups is a mass of minute brownish grains, which serve to reproduce the plant; these require a high magnifying power to see them distinctly. They are more or less angular from mutual pressure. The hairs which fringe the mouth of the cup are very sensitive to moisture, and curl up when wetted, and close the orifice. A curious thing about some of these fungi is that they are dimorphous, *i. e.* come in more than one shape. The spores do not produce the same plant, but one so unlike it as not to appear at all related to it, but the spores of the second plant may produce plants like the first one, or it may take still another generation to do so. The early growth of these fungi takes place within the leaf, and these cluster-cups, which correspond to flowers, break up through the surface. There is much connected with this subject which would be out of place in a popular description, and we have given only those points which are readily understood without introducing technical terms.

Fig. 2.—CLUSTER-CUP.

The Cluster-cups above described were sent us by T. W. Sparkman, Clifton, Tenn., who says: "It has been on some trees in this vicinity several years; it gradually gets worse, and the trees fall until they are at length dead. One of the worst trees is a wild Crab Apple, of which I send some specimens. There are a great many limbs attacked, and some of the apples."

At first we supposed it to be a new fungus, but find it was described in 1831, by that industrious botanist, the late L. D. deSchweinitz, in the Transactions of the American Philosophical

Society, where he calls it *Ecidium Pyratum*. The generic name is from the Greek, and means *like pustules*, and the specific one, *Pyratum*, is given because it grows upon *Pyrus*, the apple. Mr. S. asks what is the remedy. This is not so easy to give. If well established in an orchard it is difficult to tell where to begin. The trees should be watched early in the season, and if only a few are affected we should cut them down, but this should be done before the fungus gets old enough to propagate itself. To know exactly what is best to do to prevent its spread one must study its appearance on the spot.

Growing of the Potato from Cuttings.

BY PETER HENDERSON, BERGEN CITY, N. J.

About the first of last April, I stepped into the store of B. K. Bliss & Son, and innocently asked for 10 lbs. of the Early Rose Potato, which he had offered in his advertisements at the modest price of \$2 per lb. Mr. B. informed me with all suavity that he could not let me have 10 lbs., but would (here he looked patronizingly) let me have half that quantity. I had agreed to let a friend have 5 lbs. of this famous Potato, and had intended the other 5 lbs. for my own planting, but being the possessor of only \$10 worth (5 lbs.), I of course handed them over to my friend who had deputed me to buy. He in turn handed me

Fig. 1.—POTATO CUTTING.

back one of the precious tubers—weighing exactly 4 oz.—which he requested me to "experiment" with. Now, whether it was the patronizing manner of my illustrious rival, or whether it was the suspicion of a covert joke made by my friend when he handed me this small potato to "experiment" with, I do not know, but an experiment was begun. On the 6th of April, I cut this 4 oz. Potato in two pieces, so that each surface would present the greatest number of eyes. I then placed them on the soil of one of our green-house benches, keeping them entirely dry until the cut part had healed over, and the shoots began to start from the eyes—the temperature of the green-house averaging perhaps 70 degrees. As soon as the shoots got to be 4 or 5 inches in length, they were cut off, as in figure 1, about 4 of an inch from the surface of the potato, or far enough off so as not to injure the latent eyes that were yet to start. The cuttings were then placed in the propagating house, and shaded and watered until rooted in the usual way, when they appeared as in figure 2. They were then potted in 2-inch pots, in rich soil, and started to grow in the same tem-

perature in which the potato had been placed. As the season advanced shoots in great numbers were thrown out by the Potato, which in turn were submitted to the same process of rooting. As the first shoots grew to lengths of 7 or 8 inches the tops were cut from these and used as cuttings,—so that by the first of June this small potato of 4 oz. had given me nearly 150 plants, every one of which was equal to a "set" made from a tuber. These were planted out on the first week in June, in land very ill suited for the growth of the Potato, and the crop, when dug in September, weighed exactly 450 pounds, or an increase of about 1600 fold.

It may be questioned if this process is of any practical value, or whether it will pay. It is not claimed that there is any use in the practice if potatoes are being sold at ordinary rates, but

may be doubted if there is much new in either Horticulture or Agriculture; processes that are suggested to us by circumstances to-day may have been practised by others a century ago, and if published to the world at all, have long since been forgotten; but there is little doubt that this practice of growing potatoes from cuttings will be new to ten thousands of your readers, though the principles involved, and perhaps the practice followed, have been long known to many experienced Horticulturists.

Treatment of House Plants.

In an article on House Plants, in October last, it was mentioned that the plants should be gradually accustomed to their change, and this fact is to be borne in mind. Whenever the external temperature will allow it, open the window for a while during the warm part of the day. Watering is oftener overdone than neglected. But a few plants, such as Cuscuta and semi-aquatics, will thrive if the soil is kept soaked. The roots need air as well as moisture. The practised eye can tell by the looks of the soil, or the pot, if a plant needs water. Better let it get a little too dry occasionally, and then give it a good drenching, than to apply frequent dribblings. Dryness of the atmosphere is one of the great troubles of in-door flower-growing, and this must be overcome as much as possible by evaporating water on the stove or furnace. Where the room is heated by an open fire, there is less difficulty. Another plan is to have a shallow box of the size of the window-sill, or the table upon which the plants stand;

Fig. 2.—ROOTED CUTTING.

when they are sold at the rates even yet paid for the Early Rose, there is no doubt whatever of its utility. For example, 1 lb. of potatoes so grown will easily produce 500 plants, making 500 hills, which, with ordinary culture, will give 3 lbs. per hill, or 1500 lbs. Now the process of propagation is neither difficult nor costly, and can be done just as well in a common hot-bed as in our best-appointed green-houses; the ordinary hot-bed sash, 3 feet by 6, will hold 500 plants, if placed in the soil of the hot-bed exactly as Lettuce or Cabbage plants are pricked out, and treated much in the same way by careful shading and watering until the cuttings have rooted. These in turn, as they grow, make other cuttings from the top, as before described. If the variety is very scarce the crop may be still farther increased by taking cuttings from the plants after they have made a growth in the field. Without resorting to the glass propagation at all, a potato crop may be doubled or trebled in quantity by "slipping" the shoots, and planting them out at once, if there is a continuance of rainy weather for two or three days, at the time it should be done, in June. The thinning out of shoots from the regular planting will do no more injury to the plants than the thinning out of a hill of cabbages or melons would. It is not claimed that the growing of potatoes from cuttings is new; in fact, it

this should have sides about 3 inches high, with some 2 inches in depth of clean sand in it. The pots are placed on the sand, which is to be kept damp. Dust, the housekeeper's great enemy, is another thing the plant-grower has to contend with. To be healthy, the plant must have clean foliage. Some very careful persons throw a sheet, or other light cloth, over the plants, while the room is being swept. This must, of course, be prevented from resting upon the plants, by some contrivance. A stout rod, made to fit in to each corner of the plant-table, would answer. Give the plants a showering as often as necessary to keep them clean. Set them in a sink, or bath-tub, and shower the foliage with water from a pot with a fine rose. If a plant gets very dirty, as sometimes will happen, sprinkle it to moisten all the leaves, and then go over it and rub each leaf gently between the thumb and finger, to loosen the dirt; after this give a plentiful showering. This can only be done with smooth-leaved plants. The outsides of the pots should be kept clean by the occasional use of a scrubbing-brush and water.

FORCING RHUBARB.—Those who have an abundance of rhubarb roots may have the leaf stalks during the winter with but little trouble. Take up some strong roots and place them in a

barrel with a little earth. Cover the barrel and set it in a warm place, and the leaves will soon push. Grown in this way rhubarb is crisp, tender, and well blanched. Roots that have been thus treated are not worth planting out again.

FUNGI AS FOOD.—In another column is an account of a minute and troublesome fungus. Some of the fungi, such as the mushroom and morel, are prized as delicacies, but the edible ones are not confined to these. Unfortunately, it is difficult for most persons to go beyond the mushroom for fear of eating some of the poisonous ones. As a step towards increasing the knowledge of these plants, and to enable people to know the good from the bad, the Royal Horticultural Society (Eng.) held an exhibition of fungi, and it was found that the number of edible ones was much larger than was supposed. The Rev. M. A. Curtis, of S. C., has investigated the subject more thoroughly than any one else in this country, and has promised a work on American Edible Fungi, the appearance of which we look for with no little interest.

Look Out for Your Seeds.

After all possible care has been expended in collecting seeds, they are often lost through inattention. Mice are exceedingly fond of some kinds of flower and garden seeds, and their access to them should be guarded against. In keeping the mice out, it will not do to have the box thoroughly air-tight. Seeds must, of necessity, contain more or less moisture, and if kept in considerable quantities in a close vessel, they will mould. The temperature at which seeds are kept is of but little consequence with many kinds, while others are injured by too great cold. A place in which the temperature ranges uniformly between 32 and 40 degrees is, perhaps, best. Peas and beans are apt to be infested by the weevil. Placing these in a close bottle, with a few drops of turpentine, is said to be the best method of treating the seeds.

A Chapter on Honey Locust.

"E. S." Highland, Kansas, writes: "Give us a chapter on Honey Locust. At present it bids fair to become the most valuable tree for this country. It grows here anywhere, and under all circumstances where any other tree lives, is good for hedges, or groves; as yet, it is free from insects or diseases of any kind, does not sprout from the roots, never winter-kills, is easily transplanted, and is a very beautiful and graceful looking tree. Even grasshoppers do not injure the young seedlings. There are two kinds here, one with thorns, and one without. Now, will seeds from a thornless tree produce thorny seedlings, or will seeds from thorny trees produce thornless seedlings? We want the thorny ones for hedges and the other for groves. There are some good specimens of Osage hedges here, but the plant is objectionable. It kills out in wet places, much of the wood freezes down in winter, it sprouts from the roots in plowing close, and various kinds of insects, especially grasshoppers, are very destructive to it."

It is not often that a correspondent does so cleverly for himself that which he asks us to do for him. He has given so complete a "chapter on the Honey Locust," that there is but little to say in regard to its availability as a hedge plant.

We have frequently advocated its merits as the plant best suited to form a barrier in our northern climates. The thornless forms are

HEART-LEAVED MANNETTIA.

more common at the West than at the East. We doubt if there is any certainty that the seedlings from the thornless form would be without spines, but in sowing for hedges should prefer net to risk it. In a large number of seedlings from thorny trees some will be found that are thornless. The only sure way to get the smooth variety for shade trees is to graft it. Seeds are readily collected, or they may be had of the dealers at about 75c. per lb. If kept dry they should at sowing time be scalded, and allowed to soak until the skin is softened. We once collected a quantity, mixed them with earth in a box, and allowed them to remain exposed to the weather all winter. When planted in the spring they came up as readily as beans. The seeds may be sown along the line of the hedge, but it is much better to put them in a seed bed, where the young plants can be cared for. They may remain in the bed all winter, and the next spring the hedge can be set. Cut the plants back to three inches, and set a foot apart.

A Pretty Climber.—The Mannettia.

Aside from their usefulness in covering objects which we wish to conceal, climbers have a grace peculiarly their own, and are often used in good taste without any utilitarian view. Some kind of support, a rude stake, or an elaborate trellis, covered with climbers, may often be introduced with good effect. The labored trellises are usually very ugly, but a rapidly growing vine will soon hide the mechanical appearance. For low trellises, such as may be made by stretching wires along the front of a veranda, there are several green-house plants which may be used. Our prolonged hot weather

allows us to enjoy out of doors many plants that in England and the north of Europe can be grown only under glass. Every year the number of these is increasing, as experiments are made with tropical plants in the open air. In the spring of 1867, friend Meehan, of the Gardener's Monthly, sent us a plant of *Mannettia cordata*, (sometimes called *M. glabra*), which was set out, but as it did not have sun enough it flowered but little. In autumn the somewhat tuberous root was taken up, put in a pot of earth and kept rather dry in a cold room all winter. Early in spring it started, and when the weather became warm, it was turned out in a sunny place,

against a wire trellis, and it has been beautiful all summer. The engraving shows the flowers and leaves of the natural size. The flowers are of a brilliant scarlet, and remain for several days. In England this is regarded as a stove plant, requiring even a higher temperature than the green-house. It is propagated by root cuttings or from those of green wood. We suppose that most florists keep it, at all events, they ought to, and popularize such a pretty climber, and one that by the method above indicated, can be managed by those who have no hot-house.

Monkshoods—Aconites.

Among the old-fashioned herbaceous perennials the common Monkshood (*Aconitum Napellus*) is one of the best known, and it has long been cultivated for its spikes of curiously shaped, dark-blue flowers. One of the parts of the calyx is very much enlarged, and is so strikingly hood-shaped as to make its common name more appropriate than such terms sometimes are. Several other species are in cultivation, but all that we have seen in our gardens are of the blue-flowered section. There are species with yellow and with reddish flowers. There is a white-flowered variety of *A. Napellus*, but it is not nearly as fine as the Variegated Monkshood (*A. variegatum*.) This has light-blue flowers, finely edged with white. The Chinese Monkshood (*A. Chinense*) has its flowers in looser spikes than the common one, and of a remarkably deep blue. The engraving is from this species, and while it gives only a portion of a spike, very well illustrates the singular shape of the flowers. All the above are from foreign countries. We have two native species, one

CHINESE MONKSHOOD.

with blue flowers, (*A. uncinatum*.) found in the Alleghanies, and a white-flowered one (*A. reclinatum*) in the mountains of Virginia and southward. These are seldom seen in cultivation, nor are they particularly desirable, as they have weak stems, and are of a straggling habit. In the Monkshoods all the visible portion of the flower is the calyx, of five parts or sepals, one of which is enlarged to form the hood; there are but two petals, and these are of a shape so unusual that they would not at first be recognized as such. At the upper part of the engraving is a flower from which the calyx has been removed, leaving only the two petals and the cluster of stamens and pistils. By a stretch of the imagination a resemblance can be seen in the petals to a pair of swans attached to the cluster of stamens as a ear. In some localities the common Monkshood goes by the name of "Cupid's Car." It should be known that all the Monkshoods are poisonous when taken into the system, though perfectly safe to handle. Some careless gardeners have by mistake mixed the roots with those of horseradish, and fatal results have followed. There is so little resemblance in the appearance of the two roots that it is not easy to see how such a mistake could be made. An English writer proposes to banish the Monkshoods from cultivation because they are poisonous. He should include the Larkspurs, Hellebores, Ranunculuses, and Fox Gloves, for they, as well as other garden favorites, are poisonous also. As long as the equally poisonous Stramonium grows along the road-sides and in the fence corners, and the Poison Hemlock is found in the close neighborhood of dwellings without molestation, we doubt if the deleterious character of some of our garden plants will prevent their cultivation.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Sea-Side Fare.—The Mussel.

This series of articles, describing along-shore fare, concludes with an account of one which, in this

Fig. 1.—EATABLE MUSSEL.

country at least, is less prized and less used than any other of those we have noticed. The common Mussel (*Mytilus edulis*) is found on both shores of the Atlantic. The shape of the shell is shown in figure 1, but it is given under the average size. The shell without is of a purplish-black color, within of a much lighter color and a pearly lustre. The animal, or meat, is conformed to the shape of the shell, and is of a more or less dark orange color. It has a number of stout fibres, called a beard, by which it attaches itself quite firmly to rocks, mud-banks, etc.; this is to be removed in preparing the mussel for food. In Europe, the mussel forms an important portion of the food of the people near the coast, and they are consumed for fish-bait to such an extent that large sums are invested in raising them. Those are said to be best which grow at the mouths of rivers, where they are left bare at low tide. The author of an English work, called "Wholesome Fare," says: "Mussels are occasionally unwholesome or poisonous. There is no test—onion, silver spoon, or other—by which to know whether mussels will prove injurious or not. Something may depend on the season and on their fresh-

thoroughly clean, the mussels are put into a pot, covered, and kept over the fire until all have opened. The meat is to be picked out and the adhering beard removed, when they may be served with melted butter, or stewed. The following is the method of pickling mussels practised in a celebrated N. Y. restaurant: The mussels are opened by boiling in the shell, as above directed. A pickle is made with three pints of vinegar and one of water, a few whole grains of allspice, pepper and cloves are added, the whole allowed to come to a boil, and when the pickle is cool it is poured over the mussels, which are placed in glass or earthen jars. Besides the true Mussel described above, there are several others known by the name, although conchologists place them in a separate genus; some of them, being found only in deep water, are comparatively rare. We figure the most common, which is abundant in shoal water, and has the reputation of being unfit for food. It is much larger than the common Mussel, different in shape, with a rougher shell and a more copious beard. This is the *Modiola plicatula* of the conchologists, and is called "Yellow Mussel" by the fishermen.

Household Talks.

BY AUNT HATTIE.

How do you like my new picture frames? They are perfectly simple, and, like simple things generally, are pretty. An ingenious neighbor of mine taught me how to make them. Those who are fortunate enough to live in the country, and more fortunate still to have a wheat stack in the yard, can readily obtain the straws. Select any quantity of white or dark straws, as preferred, being careful to use none but perfect and unbruised ones, and choose those as uniform in size as possible. Some narrow lutestring ribbon will be required for trimming, or you may use instead, colored worsted, chenille, or silk, as convenient and to your taste. A straw carefully split and flattened out, first wetting it, makes a very neat fastening. When ready to make a frame, take three or four straws, lay them

Fig. 2.—"YELLOW MUSSEL."—(*Modiola*.)

ness, and also on the eater's individual constitution. Some persons eat heartily of mussels at all times with impunity; others dare not swallow a single one." It is perhaps due to this uncertainty that mussels are not generally popular on our sea-board; still, with many, they are regarded as a choice delicacy. Pickled mussels, especially, are served at city restaurants, where they are held in high esteem by the lovers of good things. They may be stewed, scalloped, etc., in the same way as oysters. In whatever way they are cooked, they are first boiled out as directed for clams. The shells being made

in a horizontal position, and holding between the thumb and finger, pierce with a needle and thread, securing firmly. Do both ends alike, and make the four sides in the same manner; adjust according to the size of the picture to be framed, fastening the corners together with the needle and thread. Some cut the ends even with a pair of scissors, but it gives a prettier effect to allow the central straw to remain a little the longest, as shown in the engraving. Trim the corners, paste the picture on the back, and it is done. If it is desired to hang the picture on the wall, a cord and tassel of worsted may be made, or a simple band of the ribbon may be used. Two straws with a third across them may be fastened to the back to form a support, which will allow the frame to stand upon the table or mantle-piece. The *Agriculturist* has already figured frames made of the brown stems of evergreens. Raisin stems dipped in melted red sealing wax make an exquisite frame in imitation of coral. Work of this kind affords pleasant occupation for winter evenings. Cone frames are very pretty, but require considerable time to make. A rough frame is provided and covered with scales of pine cones, which are put on

singly with small tacks, neatly overlapping one another like the scales of a fish. Whole cones are used here and there, as taste may dictate.

One of the most acceptable desserts recently introduced, consists of a corn starch custard pudding, garnished with the sweetened and flavored froth of the whites of eggs, or Meringue, as it is called. The recipe is as follows: *Corn Starch Pudding*.—Set to boil one quart of sweet milk; then moisten in a teacup with a little milk 3 table-spoonfuls of corn starch; beat thoroughly the yolks of 4 or 5 eggs, adding sugar enough to sweeten the whole of the pudding. Then beat to a stiff froth the whites of the eggs, adding a very little sugar and flavoring extract; but be careful not to reduce the froth. As soon as the milk boils, stir in the moistened starch. Let it boil up once, take from the fire, and stir in immediately the yolks of the eggs, pour into a pudding dish, and place on the top the frothed whites, spreading as evenly as possible. Set in the oven until the top or Meringue is of a fine light brown, when the pudding is done. To be eaten cold. The same lady also gave me a recipe for a plain rice pudding, and as I

STRAW FRAME.

have frequently tried it and found it to be very good, I am desirous that others should know how to make it. *Rice Pudding*.—Soak over night in cold water a coffee cup of rice. In the morning add two quarts of milk; sweeten and spice to taste. Place in the oven; when the rice rises in the pudding it is done. Quite simple and plain, but more wholesome and good than more elaborate ones.

Keeping a Family Record.

Whoever has had occasion to trace his lineage back to the first settlers of the country has learned the very loose way in which family records are usually kept, and been surprised to find how little intelligent men know about their ancestors. It is not unusual to find family records, but they are in an imperfect state, on stray pieces of paper, liable to be lost, or in small blank books mixed up with family expenses, the births in one place and the marriages in another. It is quite common to find people who cannot tell who their grandparents were, or if they know these, they are ignorant of their grand uncles and aunts. Many who are intelligent thus far, perhaps by reason of a personal acquaintance with these relatives, can trace their kithred no further back. Not one in a hundred preserves even the names of his ancestors beyond the third generation. As a people we have little pride of ancestry, and are quite too busy with the present to think or care much for the past. And yet the past has had much to do with our present, and we who are now upon the stage will have quite as much to do in moulding the characters and shaping the destiny of those who are to come after us. It is a duty that we owe to our children and children's children to put them in possession of the names and dates in the family history with which we are familiar, and which will soon be forgotten if they are not recorded.

Town, church, and cemetery records are important in their places, but they ordinarily contain only fragments of a family history. It is not uncommon in completing the record of a family that lived a hundred years ago to find the dates in many different towns where the children were born or died. What is wanted is a brief record of the dates of marriages, births, and deaths, in tabular form. To this should be added the name of the place where the family resided when the children were born, and the particular farm or house, if it can be designated. It is always interesting to know where our ancestors lived and what their occupations were. It is desirable that a man should preserve in permanent

form not only his own family record, but that of his father and those of his paternal ancestors as far back as he can trace them. There are blank forms of these records published, and in many of the issues of the American Bible Society there are pages with appropriate headings for them. The particular form is of less importance than that the record be made in some place where it will be preserved and cherished by those coming after us.

"But what is the use of the record?" some will ask, who have a sharp eye to the dollars and cents. It may be of no pecuniary value whatever. It will add nothing to the fertility of your fields and make no better sales for your crops. Pedigree may count for much less peculiarly in a man than in a horse. And yet even in this democratic country and in this utilitarian age, it may be worth a man's while as a matter of intelligence to know something of his origin, something of the homes, occupations, and characters of his ancestors. The knowledge would certainly do him no harm, and it might throw some light upon the tastes and peculiarities that he sees cropping out in his children, and help him to better methods of training. We inherit much beside worldly estate and physical constitution from our progenitors. A little study of this inheritance may profit us quite as much as watching seed sowing and harvest. Let us have the Family Record.

Recipes and Household Hints.

Pickled Oysters are always in place at holiday tables, and on festive occasions generally. They are sold by the dealers at a high price, but are easily prepared at home. The chief thing to be observed is, not to overdo the matter at any point; much must be left to care and judgment. Select good-sized, plump oysters, put them over the fire in their own liquor and simply scald them; the moment they look white and firm they are to be taken from the fire, and laid out singly on a clean board or table to cool—if they drain thoroughly, or become slightly dried, all the better. Allow the liquor to settle, pour off the clear portion and make with this and vinegar sufficient pickle to well cover the oysters. The proportions to be used will depend upon the strength of the vinegar, and will vary from one-third to one-half oyster liquor. The pickle should not be more than pleasantly sour; it is a common mistake to use too much vinegar. The right proportions of liquor and vinegar being ascertained by taste, whole cloves and pepper, with broken-up mace, are to be added. In using spices no rule can be given, and it is better to err on the side of moderation. Boil up the pickle with the spices, allow it to cool, and pour it over the oysters placed in a proper jar or dish. They will be fit to use the next day. Sometimes thin slices of lemon are added when the pickle is cool, but we prefer to allow each person to add his own lemon, if he likes it, when the oysters are served.

Cleansing Tainted or Musty Barrels.—"A. N.," Lindley, Mo., writes: "I have practiced the following plan for the last thirty years with complete success. Soak the barrel thoroughly with water, pour out the water and white still wet fill the barrel with clean, dry sand or loam, but sand is the more easily removed. Let it stand a few days, turn out the sand or earth, and it will be as free from taint or must as when new."

A Dish of Chestnuts.—"J. T. B.," Falls Church, Va., gives the following experiment: "I removed the shells from a quart of chestnuts, and parboiled them. I then took off the thin under-skin, and put them back into the saucepan with a quart of milk, salt, nutmeg, and two big teaspoonfuls of flour stirred with water for thickening. I stewed until the chestnuts were soft, taking care not to break them in stirring. This makes a rich and excellent dish." This is worth trying.

Pickled Artichokes.—"Wash the artichokes clean, and pour pretty strong salt water, boiling hot, over them, and let stand until cool; spread on a cloth to drain; put in a jar and pour boiling vinegar over them, and if not too large they

will be ready for the table the next day, and no pickle is better." Of course the Jerusalem Artichoke that grows somewhat like a potato is intended.

Keeping Sausage Meat.—Jane Burton writes: "Cook fresh sausage as for the table, without flouring it; then put it in layers in a sweet earthen or stone pot with gravy from running hot lard over each layer. It will be as good as when first made, as we are eating it now in October with a good relish, and it is delightful."

Breakfast Puffs.—Take 1 pint of milk, 1 pint of flour, 2 eggs, a lump of butter the size of an egg, and a pinch of salt. Place the flour in a basin, put the butter in the center of the flour, break in the eggs, and work the butter and eggs together thoroughly; then gradually add the milk, mixing all together to form a smooth batter. The puffs may be baked in a cast-iron pan with small divisions, similar to the "French Roll Pan" figured in January last, page 25, previously heating it, but a tin pan of similar shape is generally used, or small, separate patty-pans, though less convenient, will serve. Butter the pans and fill them about two-thirds full with the batter and place in a quick oven. They take but a few minutes to bake, are light, and excellent, as the writer happens to know.

Bay-Leaves are frequently directed for flavoring custards, and similar articles of cookery. It is the leaf of the *Laurel nobilis*, the poetical "Laurel" or "Bay." The leaves of the Cherry Laurel, or other Laurel, should not be used in their place. The true Bay-leaf is kept by city druggists.

Folding Napkins.

For every-day family use there can be no improvement on the usual way of neatly folding the napkin in a square form, whether it is placed in a ring or not. But there are occasions when one wishes to decorate a table, and then the napkin can be made to contribute to the general effect. Some of the forms in which napkins are folded are very elaborate; we give two simple and neat ones. Like many simple operations, the folding is easy

Fig. 1.

enough when one sees it done, though not readily described; but we will try and make it plain by the use of a few diagrams. Take a towel-shaped napkin, and fold over one-third, then turn it backwards, and the napkin will be folded in three, not over and over, but so that the edges when opened would be in the position of the lines in the letter N.

Fig. 2.

Then fold the ends over until they meet in the middle, as in figure 1; then fold the corner *a* down to *c*, and the corner *b* up to *d*, and it will give the form indicated by the dotted lines. Turn this over and fold it in halves lengthwise; open the points and it will be like figure 2. Bend the point *a* over to the left and tuck it under the groove at *b*, and bring the point *c* around and place it in a groove which will be found when *a* is in position. The result will be the form in figure 3. This is called the "mitre," and is usually set upon the plate with a piece of bread in the center. Another form, called the "water-lily," though it looks more complicated, is as easy to fold.

Fig. 3.

For this a square

napkin is required; fold it like a half handkerchief. Bring the two points of the long edge up to meet

Fig. 4.

the center one, which will form a square. Roll up the corner opposite the points, as shown in

Fig. 5.

Fig. 6.

figure 4. Turn the napkin over and roll point *a* in about to the center, tuck point *b* in the groove, and it will give figure 5, which may be used in this shape, or by turning down the folds may be made into the form shown in fig. 6. Napkins when folded in any of the fancy forms should be slightly damp.

The Proprieties of the Table.

A friend writes thus: "By the proprieties of the table, I do not refer to the behavior of those who sit thereat, but to the proprieties to be observed in providing the food to be placed upon it. I know that some things go together very well, while others do not. I know that roast mutton and turnips seem made for each other, while sweet potatoes and corned beef were divorced by nature, and so with many other things. Now can't you tell us what goes with which?" Our correspondent's query touches the very starting point in good living, which does not consist so much in costly food as in the fitness of things. The trouble in the whole matter is that our people, while they are willing enough to expend money upon what furnishes their tables, are quite unwilling to give proper thought to their selection of food. It is somehow considered undignified or improper to make a study of gastronomy by man or woman. Under the plea of living on "good, plain food," a good share of our people lose much of the enjoyment of the table. "None of your mixed French ruses for me," says many a one who regards beef-steak and onions, or corned beef and cabbage, as "good, plain food." French cookery is no different from any other good cookery, except to make the best possible use of the materials at hand. Much of the prejudice against French cookery arises from the fact that names that are not understood are applied to excellent dishes. *Friedeau de Veau* would not be tried by one in a thousand of those who would accept and relish it under its true name of stewed veal, and so on. We have alluded to French cookery merely because the French people have studied the matter, and have found out the harmonies and contrasts of taste which exist, though perhaps in not as marked a degree, as well as those of color and sound. Our ladies pride themselves on their skill in selecting proper colors for dress, and if they would give the same thought to it they might acquire equal skill in discerning the harmonies and discords of taste. The enjoyment of a meal depends more upon the fitness of the things provided, than it does upon their rarity or richness. Our correspondent cannot be answered in a single article, but we will try to help her by giving some bills of fare, indicating "what goes with which."

BOYS & GIRLS' COLUMNS.

A Handful of Dust.

The tidy housekeeper would vigorously drive it from her kingdom with the broom; the little child would take it to make mud pies with; the philosopher thinks it worthy to be carefully examined—there may be some grains of precious truth in it. Let us borrow the spectacles and try to find them. Of course these spectacles are microscopes, showing us what a fly might see "with his little eye." Presto! change! The little brown heap has suddenly become a large pile of many colors and curious shapes. The glass shows what appear to be smooth pebbles, of many different kinds, bits of rocks broken from larger masses, ground small under many a wheel that has passed over them in the well-traveled road, their sharp corners worn away by exposure to the weather, and constant hard usage. Rich bit has a marvelous history from the time when the frost, or the prying root of some plant, or the blow from some quarryman's hammer, or other sufficient force, loosened it from its long-time home and started it on its travels. When ground a little finer, and acted on by the elements, these fragments will be chemically changed, seized upon by growing plants, and transformed into portions of their organized substance, to start on a new round of experiences. Volumes of science and history would be needed to complete the record of a single one of these grains. Another look at the heap shows many rusty fragments of iron—brought perhaps from distant mines; they have done service in many forms, finally were struck off from the wheel-tires or the horse-shoes, and are slowly rusting away—not to be lost, but made over in new combinations. Here are shreds of leather—the boys and girls, who wear out shoes so fast, with almost tireless feet, can tell something of how these came there. Scraps of woolen, silk, and cotton, have done their part for awhile in the service of man, and are here awaiting further use. Fragments of bones, chips from insects' wings, bits of down from the bodies of birds, hair, wood, leaves—in short, mementos from almost every department of life, give food for abundant thought and fancy. Whoever can spend an hour or more in carefully studying a handful of dust with a microscope will find that Nature has abundant materials at hand for working over into the new patterns which she so lavishly displays yearly in the fields and forests, and by noting the wisdom there displayed, may add much to his own store.

Different Ways of Laughing.

Man is the only animal that laughs. Some creatures make a noise resembling laughter, but as "there is no fun in it," as the boys would say, it does not deserve the

No. 1.—A QUIET SMILE.

name. It is both amusing and instructive to observe the different ways of laughing; the varieties are as numerous as individuals, for almost every person has his own style, so distinct that he may be easily recognized by his laugh. Our artist presents three specimens, which

No. 2.—FULL OF FUN.

are fair samples of different classes of laughers. In each, the character is quite plainly indicated by the style in which pleasure is expressed by the muscles of the face.

First (No. 1.) we have a natural, quiet smile. The man enjoys anything comical, but has sense and self command enough not to be overcome by it. He has natural strength of character, which has been polished by education, so that his faculties are under control. Contrast his expression with either of the following. No. 2 is bimsful of fun, and running over with laughter, which he vainly tries to hold in with his hand upon his mouth. He will giggle at the merest trifle—at a mistake of a companion, an odd motion by an animal, at almost any-

No. 3.—THE SIMPERER.

thing unexpected. He is good natured, weak, easily led, uncultivated, requiring great care to make him a useful member of society. No. 3, the "Simperer," has been educated in a very different school from No. 1. He believes in outside appearances; knows what is the latest fashion, wears much jewelry, carefully cultivates his whiskers, thinks all the ladies are in love with him, applauds himself with a continual smirk, and is altogether a silly, shallow-brained fool. He might be cured by sending him to the forests of Maine, to chop wood a few winters, but there is little hope of his having pluck enough to try this treatment, or any other requiring real manliness.

Our Presidents.

Every American boy and girl should know the following table by heart, and should also be able to give some account of the principal acts of the different men named. Those who will begin by committing it to memory, and then follow it up by reading some good biography of each President, will have a better knowledge of the history of the United States than is possessed by more than one-half the men and women in the United States.

A Picture for Boys.

A correspondent writes to the *American Agriculturist*: "I have indulged the habit of using tobacco in various ways, for more than twenty-five years. I learned it when a boy, because I wanted to do as men did. For a long time I could not perceive that it hurt me, except making my breath disagreeable, and my company unpleasant to those who disliked the smell of tobacco smoke. But lately I have begun to believe what friends used to tell me. My throat, head, and nerves are suffering from the effects of the use of the weed, and I know that I can have good health only by giving it up. This I am now doing, but it is like the struggle of a slave with a cruel master. I pass miserable days and sleepless nights; my spirits are low; every thing looks gloomy, I can not fix my wandering thoughts; I have headache, heart-ache, and achings I never imagined before. The worst of it is, I feel continually that just one cigar would drive away all these symptoms, make me feel natural, and bring back all the hopes and friends that now seem to have deserted me. Why not take it and end my troubles? Alas! it would only soothe my distressed nerves a little while, and then the old symptoms of tobacco poisoning would come back in full force. It's a terrible battle; I do not know how long it will last, or how it will end. Without some relief I fear I may go crazy. What shall I do?"—There, boys, look at that picture before you light a cigar, or try a chew. It expresses the experience of almost every one who has formed this habit. Will it pay to lose health, and become a slave? If you want more evidence before

deciding, ask the next friend you may meet who has long used tobacco, whether he thinks it best. We never yet found a man who would advise another to form the habit. To the sufferer who writes for advice, we would say, "fight it out on this line." It will not "take all summer." In a few weeks, at furthest, the habit will be broken and you will feel the happiness of a clear head, elastic limbs, improved general health, and a free spirit.

An Amusing Toy.

Almost any boy can whittle out from a soft pine stick two figures like those shown in the engraving. The body and head of each are made of a single piece about half an inch thick. Two thin pieces a little curved in the middle, for the elbows, represent the two arms joined together as in wrestling. The legs are each made of one thin slip of wood, and are attached to the body by pins, so as to hang loosely. The arms are pinned on at the shoulders in the same manner, and the figures are thus made to look like two boys in a position for wrestling. They can be painted, if convenient, or merely marked with ink, to suit the fancy. When all is ready, pass a thread about six feet long through the holes in the arm near the elbows. Fasten one end of it round the leg of a table or chair near the floor, and hold the other end in the hand. The images should be two or three feet from the lower end of the thread. Now by gently twirling the string the images will be made to wrestle in a very comical way; sometimes one will go down, then the other, then both, and by a little management they can be made to perform an almost numberless variety of very queer antics, to the great amusement of the little folks.

New Puzzles to be Answered.

No. 332. Illustrated Rebus.—Truth painfully acknowledged.

No. 333. Illustrated Rebus.—Something for all to know.

Answers to Problems and Puzzles.

(COPYRIGHT SECURED.)

BLOWING BUBBLES.—*Drawn and Engraved for the American Agriculturist.*

Blowing bubbles will always be a favorite amusement. Children make theirs with soap-suds and a clay pipe; men and women use various contrivances. Every few days we hear of some new and wonderful scheme for getting rich, some way of restoring health, or some infallible method of enjoying pleasure—these are the bubbles which older people make and chase. They are as bright, as fleeting, often not half so satisfactory as the beautiful globes that the little girl can expand with her breath from the dish of suds. There is much to be learned from soap bubbles. Philosophers have studied many things connected with them with great interest. They have carefully computed the thickness of the film composing them, finding it less than one ten-thousandth part of an inch. Sir Isaac Newton experimented with be-

bles in pursuing his researches concerning the laws of light. The beautiful colors displayed on their surface attracted his attention, and he wanted to know the reason of their appearance. People who saw this grave old man apparently playing like a child thought him crazy.

Spots on the Sun.

With a good telescope, and sometimes by the eye alone, dark spots may frequently be seen upon the face of the sun. They vary much in size, some of them covering thousands of square miles in extent. Recently a very remarkable one has been noticed, extending over an area larger than the whole of the earth's surface. It was in shape like a letter Q, and the long curled part was surrounded by an immense number of smaller spots less

dark in color. Many theories concerning these spots have been given; one view quite generally held by astronomers is, that the sun is surrounded by a luminous atmosphere, and that the dark spots are places where this atmosphere has been disturbed and torn asunder, so that the body of the sun becomes visible. As yet there are no means of knowing the exact truth in the matter. We only know that by some wonderful arrangement light and heat for the solar system are continually supplied, and that agencies almost inconceivably vast must be employed to produce the immense force exerted by the sun.

There are many Premiums for Boys and Girls, and many hundreds get them each year. You can get one this year for yourself or your home.

THE BEST AND MOST ATTRACTIVE OF ALL JUVENILE MAGAZINES.

OUR YOUNG FOLKS:

EDITED BY J. T. TROWBRIDGE and LUCY LARCOM.

The conductors of OUR YOUNG FOLKS are determined to spare no pains or expense to make this Magazine the best of its kind in the world. While they will procure from the most popular and able writers articles of the most attractive character, they will aim to give the Magazine a more *practical* cast than heretofore. A greater proportion of *useful* articles will be found in the forthcoming volume,—on History, Biography, Science, Gardening, Manners. The following are some of the principal features of

OUR YOUNG FOLKS FOR 1869.

THE STORY OF A BAD BOY, BY T. B. ALDRICH.

Forming the narrative of a boy's life and experiences in an ancient New England seaport, will be the leading Serial Story in OUR YOUNG FOLKS for the year 1869. The picturesque legends and traditions of the town, and the eccentric characters peculiar to every New England Village, form the background upon which the author has traced the career of a genuine Yankee lad, whose animal spirits and healthy love of mischief led him into innumerable amusing adventures. The Bad Boy is a close study from life, and will be recognized at once, by any one familiar with the species, as a faithful delineation. He is a fresh character in American juvenile literature, which is over-crowded with unnaturally good boys.

GARDENING FOR GIRLS.

This highly interesting and important story has been written by the AUTHOR of that popular work "Six Hundred Dollars a Year," and is intended to convey, in an entertaining form, hints to young girls as to a useful disposal of their time, and to give valuable assistance in the study of Botany, serving the purpose for which it was answered for boys in the admirable serial "Farming for Boys."

HOW TO DO IT.

EDWARD EVERETT HALE will contribute, under the above title, various papers—written for the practical instruction of grown-up boys and girls, and of young men and women,—in the methods of life. They will include suggestions as to the way—How to Talk; How to Lead; How to Write; How to Travel; How to act in Society; and How to Work.

THE WORLD WE LIVE ON.

Under this title Mrs. A. S. S. will give a series of papers.

The conductors of "OUR YOUNG FOLKS" being fully sensible of the great interest felt by parents and educators in the cause of juvenile literature, will give their best endeavors to make this magazine worthily answer all reasonable demand.

TERMS—Single or Specimen number, 20 cents; Yearly subscription, \$2.00 in advance; Three copies, \$5.00; Five copies, \$8.00; Ten copies, \$15.00, and \$1.50 for each additional copy. The Atlantic and Our Young Folks sent to one address for \$5.00 per annum.

A copy of "OUR YOUNG FOLKS" for 1869, will be sent *gratis* to any person who will act as agent for it and form a Club. Specimen Copies, Premium Lists, Circulars, &c., sent on application.

FIELDS, OSGOOD & CO., Publishers, Successors to

The January number of the *Agriculturist* will contain, in this place, additional Illustrations of OUR YOUNG FOLKS.

THE HERALD OF HEALTH FREE.

This is a Monthly Magazine of 60 pages, devoted to the Physical, Intellectual, and Moral Improvement of the race. Its motto is,

"A Higher Type of Manhood, Physically, Intellectually, and Morally."

IT WILL TEACH the Laws which govern the physical organization of Man, and how to obey them.

IT WILL TEACH the Causes of Disease, how to avoid them, and the best and safest method of treatment, by the use of agents which do not poison the system.

IT WILL TEACH how Children should be born and reared, so that they may become perfect Men and Women. It is now publishing a series of articles on

"THE REARING OF OUR CHILDREN."

By distinguished American women.

IT WILL TEACH the Structure and Functions of every organ in the body, and the best method of keeping it in a healthy condition.

IT WILL TEACH what is the natural food for Man, and how it should be prepared.

IT WILL CONTAIN articles upon Bathing and Clothing; upon Exercise, Rest and Sleep; upon Recreation, Amusements and Social Enjoyments; upon Education, Topics of the Month, Home Treatment of Disease, Answers to Correspondents; and upon all subjects calculated to improve the condition and promote the happiness of mankind.

The *Scientific American* says: "THE HERALD OF HEALTH is a Journal which contains more sensible articles on subjects of a practical moral bearing, than are to be found in any other monthly that comes to our sanctum."

The *Home Guardian* says: "To commend the 'Herald of Health,' is a duty we owe to every one to whom we have the privilege of speaking. Truths are therein spoken for which your fainting hearts are waiting patiently to learn. Truths about eating, drinking, dressing, living, and loving, which shall, if obeyed, lift you out of weakness and languor, helplessness and pain, coldness and indifference, and make this wilderness world blossom like the rose."

The December number (which will be sent free to all subscribers for 1869,) will contain a very elaborate paper on

"WHAT TO KNOW, WHAT TO DO, AND HOW TO DO IT,"

which alone is worth a year's subscription. The very best writers are its regular contributors.

\$2.00 a year, 20 cents a number. 4 subscribers, \$7. 10 subscribers, \$15. 40 subscribers at one time, \$50.

For \$1.35 we send the HERALD and The New York Weekly Tribune one year. For \$3.50 we send it and the *Agriculturist* one year. For 39 subscribers and \$50, we give a Wheeler & Wilson Sewing Machine, worth \$35. We give Appleton's American Encyclopedia in 20 volumes, worth \$100, for 60 subscribers and \$120. A steel engraving of "Lincoln at Home," 18x20 inches, worth \$1.00, for each subscriber who sends 30 cents extra. The Herald of Health and the Atlantic Monthly, price \$1.00, for \$5.00. Harper's Magazine same as Atlantic Monthly. Those who subscribe now will get Oct., Nov., and Dec. Nos. of this year free. Address

MILLER, WOOD & CO.,

15 Lighthouse Street, New York.

NATURE AND OUT-DOOR LIFE

Will be the subject of articles by the AUTHOR of "THE SEVEN LITTLE SISTERS," (now in course of publication,) to which others will be added by Mr. CHARLES J. FOSTER, and by Mr. W. F. G. SHAKES, who has already prepared papers upon the FIRE-DAMP, WRECKED and WRECKING, &c.

DECLARATIONS

Of an entirely fresh character will be furnished by Rev. ELIJAH KELLOGG, author of "Sartreus" and "Jellius." The first of these, "Hannibal at the Altar," will appear early in the year.

ACTING CHARADES.

Each number of the new volume will contain an *Acting Charade*, prepared expressly for young people by S. ASHLEY FROST, the best American writer of such pieces.

Mrs. STOWE, Mrs. DIAZ, Mrs. MYCROFT, Mrs. WHITNEY, Miss CHILLER, Mrs. ASTIN, Mrs. WELLS, Mrs. THAXTER, Mrs. PIERCE, Mrs. WEAKE, Miss FROST, "SOUTHERN MAY," and others will continue their pleasant contributions, and their names are an assurance that articles for the special benefit of girls will not be wanting in the magazine.

ILLUSTRATIONS.

The Illustrations will remain under the charge of Mr. ANTHONY, and no pains or expense will be spared to supply the best which can possibly be obtained. Special prominence will hereafter be given to FULL-PAGE PICTURES.

EVENING LAMP AND LETTER BOX.

These departments will be enlarged and improved. The Editors will endeavor through these Departments to give encouragement and interest to their young friends, and they cordially invite communications from all their readers.

THE CINCINNATI WEEKLY TIMES

HAS ENTERED UPON ITS TWENTY-SIXTH YEAR,

Considerably Enlarged and Improved.

This popular Journal has for many years retained the reputation of being one of the Best Family Journals Published in the United States, and as having the largest circulation of any Weekly in the West. It finds its admirers among all Parties, its Patrons in all Sections. It contains but a limited number of advertisements, and is filled with an immense amount of entertaining, instructive, and amusing reading matter. It will be greatly superior. In addition to its being BEAUTIFULLY ILLUSTRATED, we propose to make several additions to it, which will render it still more complete and valuable. It will contain over One Hundred articles on different subjects; the Statistical Tables have been prepared with the greatest care, and the different departments will prove to be of great interest to the Farmer, the Merchant, and the Mechanic.

Out of ten thousand testimonials from its patrons in favor of the Weekly Times, we have room for only a few.

Postmasters Encourage It.

"I like your paper so well I want to see it in every family. I am and have been a postmaster from '91, and I will and must say it: The Weekly Times is the best Family Journal that comes to this office."—DANIEL FRALICK, P. M., Broken Square, O.

"I have tried the Weekly Times and find it suits my family well. Found in no other paper in politics, and in everything for a family. I love the Times."—THOS. LARR, P. M., Post Perry, Pa.

Democrats Speak Well of It.

"I am a Democrat myself, but still I like your paper as a family paper. My wife says she would sooner read your paper than any other printed in Cincinnati."—E. D. CULBERTSON, Logan, O.

"I never did like your politics, but as a family Journal I think it is the best paper for the money, to be found in America."—C. W. GREGORY, Fayetteville, Texas.

Republicans Admire It.

"I sent you a club last winter, and think I can do still better this, as the Weekly Times suits all classes, especially the Union-loving people."—D. LITCHFIELD, Des Moines, Ill.

"I consider the Weekly Times the best family paper I ever laid the honor of taking. Its high moral tone and its truly Union sentiments endear it to the hearts of all liberty-loving men and women, everywhere."—Wm. A. CARRIS, New Carlisle, Ind.

The Ladies Will Have It.

"The ladies are all constant readers of the Weekly Times this neighborhood. In fact, all of both sexes, old as well as young, pronounce it to be the best family journal known."—J. B. CUMMINGS, Xenia, O.

The American Entomologist.

EDITED BY BENJ. D. WALSH, State Entomologist of Illinois AND CHAS. V. RILEY, of Missouri. Of practical value to

Farmers, Gardeners and Fruit-Growers,

And of interest to the Scientific Man.

Profusely Illustrated.

Gives descriptions and figures of new species, and the history and habits of noxious and beneficial insects. Third number issued Nov. 1st. Published monthly at \$1.00 a year. An extra copy sent free to any one sending us five names with the money. Sample copies sent on application. Published by

R. P. STUDLEY & CO., St. Louis.

THE COMSTOCK & GLIDDEN SPADER. Awarded a Silver Medal at the Paris Exposition. Greatly improved and reduced to nearly half its original weight and price. We are prepared to fill orders for sewing work. Farmers, send for Circular. EDWARD P. ALLEN & CO., Milwaukee, Wisconsin.

A Present to every Subscriber.

The Union Hand Book and Family Diary for 1869.

This new feature, recently introduced, and which gave such universal satisfaction to our Sixty-five Thousand subscribers last year, will be continued this year.

As complete and interesting as our patrons pronounced the Hand Book for 1858 to be, the one for 1860

"Next to providing for my family food and raiment is a good newspaper; and there is none within my knowledge that deserves that name more than the good old Weekly Times."—A. REMSER, Ida, O.

To conclude, it is the universally conceded opinion of its SIXTY-FIVE THOUSAND PATRONS, that

Every Family Should Have It,

Every Merchant Should Have It,

Every Farmer Should Have It,

Every Mechanic Should Have It,

Every Woman Should Have It,

Everybody Should Have It.

Our fine colored engraving of the "GIANT TREES OF CALIFORNIA" will be sent to those who prefer it to the Hand Book.

TERMS: Single Subscriptions, \$1.00 per year. Clubs of Ten, 1.00 each. An extra copy to the getter up of the Club.

C. W. STARBUCK & CO.,

No. 63 West Third Street, Cincinnati, Ohio.

Those desiring to get up Clubs will please send for Circulars and Club Lists.

Persons remitting their subscriptions will also send six cents to pay postage on the premium.

Advertisers are referred to the above table of circulation.

The Full Reports of the American Institute Farmers' Club, and the various Agricultural Reports, in each number, are richly worth a year's subscription.

Ever since its commencement, THE WEEKLY TRIBUNE has been an authority upon the farm. We make features of the Farmers' Club, and permit no question of interest to the agriculturist to pass without comment and advice. When it is remembered that this advice is given by one of the most conscientious farmers in the country, the reader may estimate its value. It has been well observed that a careful reading and study of the Farmers' Club Reports in THE WEEKLY TRIBUNE alone will save a farmer hundreds of dollars in his crop. We shall soon commence a series of articles on Agriculture by well known practical Farmers, which will add materially to the value of THE TRIBUNE to those interested in farming. As it is, no prudent farmer can do without it. As a lesson to his workmen alone, every farmer should place THE WEEKLY TRIBUNE upon his table every Saturday evening.

The enormous circulation of THE WEEKLY TRIBUNE enables us to afford it at a small profit on each copy.

Winter Evening Amusement and Instruction.

The Most Popular Reading of the Day.

Frank Leslie's Illustrated Newspaper.

The aim of this paper is to furnish a pictorial history of current events. Between thirty and forty illustrations appear in every weekly number, including eight engravings of the pictorial staff of the foreign press, events of national or local interest, railroad or steamboat accidents, amusing and thrilling incidents, comets, &c. The literary matter comprises, besides well-written editorials on the leading questions of the day, and descriptions of the engravings, a serial story of thrilling interest, entertaining narratives and tales, humorous anecdotes, choice poems, &c. Subscription price, \$1 per year—five copies, \$20.

Frank Leslie's Chimney Corner.

A purely literary pictorial. Exceeding events of the day, its aim, as its title indicates, is to furnish amusement for the leisure hour. Its contents consist principally of original stories by able writers—including a serial, accounts of remarkable adventures, biographical sketches of self-made men—with portraits, descriptions of manners and customs in remote countries, short poems, fairy stories, enigmas, conundrums, charades, &c. Illustrated with large and spirited engravings, of which there are from fifteen to twenty in each weekly number. Subscription price, \$1 per year; five copies, \$20.

Frank Leslie's Lady's Magazine.

The leading fashion periodical in America. Each monthly number contains a large colored plate of the latest fashions, from designs sent from Paris as soon as invented, which are thus published simultaneously in New York and Paris; also a four-page uncolored fashion plate, embracing the various leading styles. These are accompanied with full descriptions and explanations, with numerous other illustrations. Every number contains an original letter from Paris, describing the very latest modes, by a lady whose position gives her access to fashionable society. The literary portion of this Magazine comprises a continued story, numerous interesting tales, poetry, anecdotes, &c. The whole profusely illustrated with fine engravings. Subscription price, \$3.50 per year.

Frank Leslie's Illustracion Americana.

An illustrated paper in the Spanish language, with all the attractive features, pictorial and literary, that have made Frank Leslie's other publications so popular. Subscription price in the United States, \$12 currency.

Frank Leslie's Boys' and Girls' Weekly.

One of the cheapest pictorial papers ever published. Intended for the amusement of youth of both sexes. The illustrations and literary matter are such as especially recommend themselves to the young. It contains, besides a continued story and well-written tales, accounts of wonderful adventures, descriptions and illustrations of foreign manners and customs, anecdotes and pictures of animals, familiar and funny fables, parables, &c. From twenty to twenty-five engravings appear in each weekly issue. Subscription price, \$2.50 per year.

Frank Leslie's Illustrierte Zeitung.

A pictorial newspaper in the German language, containing a large number of engravings illustrating events of the day, exciting and amusing incidents, adventures, and manners and customs in all parts of the world, with a large amount of literary matter, including numerous interesting tales. This paper combines for the German reader the attractions presented in the Illustrated Newspaper and the Chimney Corner. Subscription price, \$4 per year.

Frank Leslie's Budget of Fun.

This is a comic pictorial newspaper, published on the first of every month. Its remarkable success, and the steady increase in its circulation, attest its adaptation to the popular taste. It looks at the side of the world, from a comic point of view, and its illustrations—of which there are from forty to fifty in every issue—are directed, without respect to station or person—against the follies and vices of the times. It constitutes an almost inexhaustible source of amusement and fun. Subscription price, \$1.50 per year.

Frank Leslie's Pleasant Hours.

The cheapest periodical in the United States, containing eighty large octavo pages of letter press, with from twenty to twenty-five illustrations, besides two full-page engravings on tinted paper, in each number. A continued story, and well-written tales and stories of adventure, with humorous anecdotes, descriptions of manners and customs, amusements for young people, &c., constitute the reading matter. Terms of subscription, \$1.50 per year. Subscriptions should be sent to

FRANK LESLIE,
537 Pearl Street, New York City.

Now is the Time to Subscribe.

"Unquestionably the best sustained work of the kind in the world."

Harper's Magazine.

The most popular Monthly in the world.—*New York Observer.*
It is one of the wonders of journalism—the editorial management of HARPER'S.—*Nation.*
It meets precisely the popular taste, furnishing a pleasing and instructive variety of reading for all.—*Zion's Herald, Boston.*

"A complete Pictorial History of the Times."

Harper's Weekly.

AN ILLUSTRATED NEWSPAPER.

The model newspaper of our country—complete in all the departments of an American family paper—HARPER'S WEEKLY has earned for itself a right to its title, "A Journal of Civilization."—*N. Y. Evening Post.*
This paper furnishes the best illustrations. Our future historians will enrich themselves out of HARPER'S WEEKLY for their writers and printers and publishers are turned to dust.—*New York Ecologist.*

The articles upon public questions which appear in HARPER'S WEEKLY from week to week form a remarkable series of brief political essays. They are distinguished by clear and pointed statements, by good common-sense, by independence and breadth of view. They are the expression of mature conviction, high principle and strong feeling, and take their place among the best newspaper writing of the time.—*North American Review.*

An Illustrated Weekly Journal of Fashion, Pleasure, and Instruction.

Harper's Bazar.

A Supplement, containing numerous full-sized Patterns of useful articles, accompanies the paper every fortnight, and occasionally an elegant Colored Fashion Plate.

HARPER'S BAZAR contains, besides pictures, patterns, &c., a variety of matter of special use and interest to the family: articles on health, dress, and housekeeping in all its branches; its editorial matter is especially adapted to the circle it is intended to interest and instruct; and it has, besides, good stories and literary matter of merit.—*New York Evening Post.*

It has the merit of being sensible, of conveying instruction, of giving colored matter in every department, and of being well stocked with good reading matter.—*Watchman and Reflector.*

To dress according to HARPER'S BAZAR will be the aim and ambition of the women of America.—*Boston Transcript.*

CRADLES,

SLEDS,

SHEDS,

and other forms in almost endless variety, and when finished, the structure remains firm, so that it can be carried about without falling to pieces. Having given these blocks a practical trial in their own families, the publishers of the *American Agriculturist* were so well pleased with them that they consented to take the general agency for their sale.

The Blocks are put up in neat boxes, each box containing a set, and a card giving various designs of buildings. Price per Set: Plain, No. 1, \$2.00, No. 2, \$1.50; No. 3., \$1. Extra, Maple Finish, No. 1, \$3.00; No. 2, \$2.00; No. 3, \$1.50.

Orders are solicited from the trade, who will be supplied on liberal terms. Address

NEW BOOK FOR HUNTERS.

BOOKS FOR FARMERS AND OTHERS.

GARDENING FOR THE SOUTH;

OR, HOW TO GROW

VEGETABLES AND FRUITS.

BY THE LATE

WILLIAM N. WHITE,

OF ATHENS, GA.

WITH ADDITIONS BY MR. J. VAN BUREN, AND

DR. JAS. CAMAK.

REVISED AND NEWLY STEROTYPED.

ILLUSTRATED.

Though entitled "Gardening for the South," the work is one the utility of which is not restricted to the South. It is an admirable treatise on gardening in general, and will rank among the most useful horticultural works of the present day. Horticultural operations are clearly explained, and more in detail than is usual in works of this kind. To those living in the warmer portions of the Union, the work will be especially valuable, as it gives the varieties of vegetables and fruits adapted to the climate and the modes of culture which it is necessary to follow.

CONTENTS.

CHAPTER I.—Formation and Management of Gardens in General.	
CHAPTER II.—Soils—Their Characteristics.	
CHAPTER III.—The Improvement of the Soil.	
CHAPTER IV.—Manures.	
CHAPTER V.—Manures—Their Sources and Preparation.	
CHAPTER VI.—Rotation of Crops.	
CHAPTER VII.—Hot-beds, Cold Frames, and Pits.	
CHAPTER VIII.—Garden Implements.	
CHAPTER IX.—Propagation of Plants.	
CHAPTER X.—Budding and Grafting.	
CHAPTER XI.—Pruning and Training.	
CHAPTER XII.—Transplanting.	
CHAPTER XIII.—Mulching, Shading, and Watering.	
CHAPTER XIV.—Protection from Frost.	
CHAPTER XV.—Insects and Vermin.

THE
HUNTER AND TRAPPER.

BY

HALSEY THRASHER,

AN EXPERIENCED HUNTER.

ILLUSTRATED.

This little book will be read with interest by all who would find instruction and entertainment in the narrative of an old hunter's experience. The following, from the author's Preface, will give an idea of the character and design of the work:

"I am a blacksmith by trade, but when I was a boy I became fond of a gun and a trap, and my first success in my shop was to make a steel trap. It was my aim to become an expert trapper, and I tried my hand at catching foxes.

"Many a dollar have I paid to cunning old men to learn the art, and I have succeeded pretty well, too; but why has not the same man of experience written a book explaining the art of successfully trapping the different kinds of fur animals? I propose to tell the boys how to do it.

"I have studied the nature and habits of animals of different species, and a plan that was good to capture the otter, the mink, and the beaver, forty years ago, is just as good now as then. The nature of animals doesn't change like the nature of men; we have grown wiser, while they have remained the same. The mode of capturing them when I was a boy, and the way used now, may be put together, and succeed better than either one alone.

"Men are traveling through the country selling recipes at a high price to teach how to dress skins. I propose in this work to teach at these things, so that a man may have them in a neat little volume for reference at any time. I shall also treat upon angling for the trout, the bass, and the pickerel, which I think I understand. I hope to make it all so plain that even the inexperienced will, in some measure, succeed."

CONTENTS.

CHAPTER I.—Deer Hunting	
CHAPTER II.—How to Catch the Fox.	
CHAPTER III.—How to Hunt and Catch the Beaver.	
CHAPTER IV.—How to Catch the Otter.	
CHAPTER V.—How to Catch the Mink.	
CHAPTER VI.—How to Hunt and Catch the Muskrat.	
CHAPTER VII.—How to Catch the Marten.	
CHAPTER VIII.—How to Catch the Fisher.	
CHAPTER IX.—How to Catch the Raccoon.	
CHAPTER X.—How to Hunt and Trap the Bear.	
CHAPTER XI.—How to Hunt and Trap the Wolf.	
CHAPTER XII.—How to Trap the Pocket Gopher.	
CHAPTER XIII.—Fishing for Trout, Pickerel, and Bass.	
CHAPTER XIV.—How to Hunt the Hoyle Bee.

NEW AND BEAUTIFUL WORK.

THE BOOK OF EVERGREENS.

BY

JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation,
Description of Varieties and their
Adaptability to Different Situations.

NOTES BY THE PRESS:

A very complete and every way admirable treatise on the Conifers, or cone-bearing plants, is *The Book of Evergreens*. Mr. Hoopes has devoted many years of labor and attention to the beautiful class of trees treated of, and his work, which is copiously illustrated, must at once become an authority. We shall be glad also, if it induces any to a closer study of trees, and to a further ornamentation of their houses with them.

[Springfield Republican.

The value of this volume consists in its being both a labor of love and of duty. The author, having devoted a life to the study of trees and plants as a practical horticulturist, records here his views and experiences. Mr. Hoopes has studied all the treatises which bear on his subject, and availed himself of the assistance of many scientific friends, as well as recorded his own experience. The illustrations are numerous and excellent, and altogether the work has all the characteristics of an authority on the subject it so minutely and comprehensively treats.—[Boston Transcript.

It is a practical treatise on the Conifers, or cone-bearing plants, describing them in all their families, and their best culture, management, and so forth, and is well illustrated. It fills a vacant niche, and every intelligent culturist of trees should have and use it.

[Congregationalist & Recorder, (Boston).

The work was evidently prepared with great care and pains, and embodies the results of years of close observation and study. It is one of great value to the agriculturist and landscape gardener, and of special interest to all who care to know anything of the flora of the globe. To those who wish to raise trees, it is an indispensable hand-book.—[Liberal Christian.

It is undoubtedly the most complete American work of the kind in print. It is well illustrated and handsomely printed.—[Boston Journal.

We have examined this handsome book with a great deal of pleasure and satisfaction. The author has pursued a very desirable plan in his work, giving sufficient scientific information to meet the wants of the botanical student, and yet the work is sufficiently elementary in explaining terms and points about plant structure, and systems of classification.—In short, plain enough to meet the wants of every reader. It is printed in neat style, with thick covers and beveled edges, and a large number of very superior illustrations.—[Journal of Agriculture.

The work is now ready. 435 pp., 12mo, on fine paper.
SENT POST-PAID. PRICE \$3.00.

DARWIN'S NEW WORK.

THE VARIATION
OF
ANIMALS AND PLANTS

UNDER DOMESTICATION.

BY

CHARLES DARWIN, M.A., F.R.S., &c.

WITH A PREFACE

TO THE

AMERICAN EDITION

BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY.

IN TWO VOLUMES.

This work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, results of in-and-in breeding, crossing, etc.

It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS; FOWLS, DUCKS, GESE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, BED VARIATION. INHERITANCE, REVERSION OR ATAVISM, CROSSING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTER-BREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.

Published in two Volumes of nearly
1100 pages.

FINELY ILLUSTRATED.

SENT POST-PAID. PRICE \$6.00.

ORANGE JUDD & CO.,
245 Broadway, New York City.

DRAINING FOR PROFIT

AND

DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,
Engineer of the Drainage of Central Park, New York.
CONTENTS.

Land to be Drained.
How Drains Act.
How to Lay Out Drains.
How to Make Drains.
How to Take Care of Drains.
What Draining Costs.
Will It Pay?
How to Make Tiles.
Reclaiming Salt Marshes.
House and Town Drainage.

EXTRACTS FROM NOTICES BY THE PRESS.

The great advantages of drainage are so apparent, that anything written upon the subject is read with interest. The author of the present work is no novice in the matter of drainage, having had much practical experience, and knowing well all the advantages of a thorough system of drainage. The book is written in, as the author expresses it, "a radical style," as he believes what is worth doing at all is worth doing well, and is a work calculated to do much good, and should be in the hands of every landowner, if of only an acre.

[*Prairie Farmer, Chicago, Ill.*]

He (the author) describes the action of draining upon the soil, the construction of single drains and systems of drains, the cost and the profit of thorough drainage, the making of tiles, and the reclaiming of salt marshes, treats sensibly of malarial diseases, and closes with a chapter which should be widely read, on house drainage and town sewerage in their relations to the public health.

[*Portland (Me.) Press.*]

Nowhere does this book merit a wider circulation than in the West. Every year adds to the thousands of dollars lost to this State from want of proper surface drainage, to say nothing of the added gain to result from a complete system of under-drainage. This book will prove an aid to any farmer who may consult it.

[*Chicago (Ill.) Republican.*]

This is a capital book. It is fully illustrated, and detailed instructions are given how to lay out the land, how to set out the drains, how to make them, also how to manufacture the tiles. And there is a chapter on house and town sewerage. . . . The book will be read with interest by English as well as American readers.

[*Gardener's Chronicle & Agricultural Gazette (England).*]

A Book that ought to be in the hands of every Farmer.
SENT POST-PAID, PRICE, \$1.50.

ELEMENTS OF AGRICULTURE.

A BOOK FOR YOUNG FARMERS,

By GEO. E. WARING, Jr.,
Formerly Agricultural Engineer of the Central Park, in New York.

CAREFULLY REVISED.

CONTENTS.

THE PLANT.
THE SOIL.
MANURES.MECHANICAL CULTIVATION.
ANALYSIS.

The foregoing subjects are all discussed in plain and simple language, that any farmer's boy may understand. The book is written by a successful *practical farmer*, and is full of information, good advice, and sound doctrine.

HORACE GREELEY says of it: "Though dealing with facts unimpaired to many, there is no obscure sentence, and scarcely a hard word in the book; its 254 fair, open pages may be read in the course of two evenings, and thoroughly studied in the leisure hours of a week; and we pity the man or boy, however old or young, who can find it dull reading. Hardly any one is so wise that he will not learn something of value from its perusal; no one is so ignorant or undeveloped that he cannot generally understand it; and no farmer or farmer's son can study it thoughtfully without being a better and more successful cultivator than before."

GOOD BOOKS

FOR FARMERS AND OTHERS,

PUBLISHED BY

ORANGE JUDD & CO.,
245 Broadway, New York.

Either of the Books mentioned below will be sent, post-paid, on receipt of the price, by the Publishers.

Herbert's Hints to Horse-Keepers. . \$1.75

This is the best practical work on the Horse, prepared in this country. A COMPLETE MANUAL for HORSEMEN, embracing: How to Breed a Horse; How to Buy a Horse; How to Break a Horse; How to Use a Horse; How to Feed a Horse; How to Physic a Horse (Allopathy or Homoeopathy); How to Groom a Horse; How to Drive a Horse; How to Ride a Horse, etc., and Chapters on MULES and PONIES, etc. By the late HENRY WILLIAM HERBERT, (Frank Forester.) Beautifully illustrated throughout. Cloth, 12mo., 433 pp.

Elliott's Western Fruit Grower's Guide. \$50

The previous Edition of this work was Thoroughly Revised; embracing all the new and valuable Fruits, with the latest improvements in their Cultivation; especially adapted to the wants of Western Fruit Growers; full Illustrations. By F. R. ELLIOTT, of Ohio. Cloth, 12mo, 503 pp.

Harris Insects Injurious to Vegetation.

8vo, Extra Cloth, \$4.00. Beveled boards
and colored Engravings. \$6.00

This very beautiful work, edited by the Hon. Charles L. Flint, is the most popular one on entomology, and, indeed, almost the only one not intended for the purely scientific student. The familiar descriptions of the insects are much aided by the excellent plain and colored illustrations. Neither this nor any other work contains all the insects one meets with, but as it comprises those which are injurious to cultivated and wild plants, it includes the more common ones, and is sufficiently systematic to give a general idea of the classification of insects. It takes a practical view of the matter, as well as a scientific one, and gives the means, as far as known, of combating these enemies of the cultivator. By the late THADDEUS WILLIAM HARRIS, M.D. Extra Cloth. Beautiful engravings on steel. 8vo, 640 pp.

Hooper's Dog and Gun. \$30

"A Few Loose Chapters on Shooting," with some Anecdotes and Incidents, Notes on Guns, Choosing and Training Dogs; about Game, etc. By J. J. HOOPER, Montgomery, Ala. Neat paper covers; 12mo, 103 pp.

Dadd's American Cattle-Doctor. . \$1.50.

To Help Every Man to be his own Cattle-Doctor. A work by GEO. H. DADD, M.D., Veterinary Practitioner; giving the necessary information for preserving the Health and Curing the Diseases of OXEN, COWS, SHEEP, and SWINE, with a great variety of original Recipes, and valuable information on Farm and Dairy Management. 12mo, 359 pp.

Dadd's Modern Horse Doctor. . . \$1.50

CONTAINING PRACTICAL OBSERVATIONS ON THE CAUSES, NATURE, AND TREATMENT OF DISEASES AND Lameness of Horses; embracing the most recent and improved Methods, according to an enlightened system of Veterinary Practice, for Preservation and Restoration of Health. Illustrated. By GEO. H. DADD, M.D., Veterinary Surgeon. Cloth, 12mo, 432 pp.

Johnston's Agricultural Chemistry. . 1.75

LECTURES ON THE APPLICATION OF CHEMISTRY AND GEOLOGY TO AGRICULTURE. New edition, with an Appendix, containing the Author's Experiments in Practical Agriculture. By the late JAS. F. W. JOHNSTON, M.A., F.R.S.S. L and E., etc. This is an American edition of the large and extensive English work. Cloth, large 12mo, 709 pp.

Gregory on Squashes. Paper, 30

This little Treatise, which no Farmer or Gardener ought to be without, tells all about selecting the soil for Squashes; how much manure is necessary; how to prepare and plant; about hoeing and cultivating; setting of the fruit; ripening, gathering, storing, care during winter, etc. By JAMES J. H. GREGORY. Paper covers, 12mo, 69 pp.

(Advertisements on this page, \$2.00 per A. G. Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

RECEIVE THEIR
TEAS BY THE CARGO
FROM THE
BEST TEA DISTRICTS
of
CHINA and JAPAN,
and sell them in quantities to suit customers
AT CARGO PRICES.

To give our readers an idea of the profits which have been made in the Tea Trade, we will start with the American-Wholesale Grocers, leaving out of the account entirely the profits of the Chinese factors.

1st.—The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d.—The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d.—The Importer makes a profit of 20 to 50 per cent in many cases.

4th.—On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1,000 to 2,000 packages, at an average profit of about 10 per cent.

5th.—The Speculator sells to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th.—The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th.—The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th.—The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these eight profits as many brokers, cartages, storages, cooperages and wastes, and added the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, and with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send a Post-office draft or money with their orders, to save the expense of collections by Express, but larger orders we will forward by express, "to collect on delivery."

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary packages for Clubs less than \$20.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all our goods to sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OLDONG (Black) 25c., 30c., 35c., 40c., best \$1 75 p. lb.
 OXLEY (Green) 25c., 30c., 35c., 40c., best \$1 p. lb.
 ENGLISH BREAKFAST (Black) 25c., 30c., \$1, \$1.10, best \$1.20 per pound.
 IMPERIAL (Green) 25c., 30c., \$1, \$1.10, best \$1.25 per pound.
 YOUNG HYSON (Green) 25c., 30c., \$1, \$1.10, best \$1.25 per pound.
 UNCOLORED JAPAN 25c., \$1, \$1.10, best \$1.25 per pound.
 GUNPOWDER (Green) 25c., \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1.50 per pound by purchasing their Teas of the Company.

COFFEES ROASTED AND GRIND DAILY.

GIGOND COFFEES 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, will economize in their article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the "low price of 30c. per pound, and warrant to give perfect satisfaction. ROASTED (Guatemala), 20c., 25c., 30c., 35c., 40c. per lb. GREEN (Unroasted), 25c., 30c., 35c., best 50c. per lb.

NOTICE OF THE PRESS.

From the American Agriculturist, N. Y. City.

"The Great American Tea Company," 31 and 33 Vesey-street, advertised in our columns, (though doing an immense business all over the country, but not even been complained of to us more than two or three times in as many years. On this account, as well as for other reasons we have previously stated, we believe general satisfaction is given to their customers. But stimulated by their success, several of the swindling fraternity have started or pretend to have started other "Tea Companies,"—some copying very nearly the advertisements, etc., of the old company. Some of these we know to be humbugs (one was noted last month), and as to others we have not evidence sufficient to warrant us in admitting their advertisements."

N. R.—INHABITANTS OF VILLAGES AND TOWNS WHERE A LARGE NUMBER RESIDE, BY CLIPPING AND GETTING, CAN REDUCE THE COST OF THEIR TEAS AND COFFEES ABOUT ONE-THIRD, (BESIDES THE EXPRESS CHARGES), BY SENDING DIRECTLY TO "THE GREAT AMERICAN TEA COMPANY."

Caution.—As some concerns, in this city and other places, imitate our name and style of advertising and doing business, it is important that our friends should be very careful to write our address in full, and also to put on the number of our Post-Office Box, as appears in this advertisement. This will prevent their orders from getting into the hands of these bogus imitators.

POST-OFFICE orders and Drafts, make payable to the order of "The Great American Tea Company." Direct letters and orders (as below, no more, no less).

Great American Tea Company,
Nos. 31 and 33 VESEY-ST.,
Post-Office Box, 5,643, New York City.

HORSFORD'S SELF-RAISING BREAD PREPARATION makes the most wholesome and best of bread, biscuits, cakes, puddings, and other yeast, it contains no POISON to create DYSPEPSIA, and the bread may therefore be eaten hot without detriment. Resolving the question of Line and salt, it prevents RICKETS, CHOLERA, and decay of TEETH, and promotes the growth of Muscle and Bone. In "raising" the dough it does not, like other yeast, decompose flour, but adds nutriment to the bread, and otherwise improves it in quality and quantity. Each package contains full directions for use. Send to H. T. Love No. 5 James slip, New York, for "The Good Cook's Hand Book" for particular directions, to be sent you gratis, and ask your Grocer for "Horsford's Bread Preparation." JOHN DWIGHT & CO., Wholesale Agents, No. 11 Old Slip, New York.

RURAL IMPROVEMENTS.

Robert Morris Copeland, author of Country Life, furnishes plans and advice for laying out Public and Private grounds of every description. Refers to John M. Forbes, Nathaniel Thayer, and J. H. Shaw, Jr., Architects, (C. S. Hubbard, Phil Adolphus, J. D. Fletcher, Indianapolis, Ind.) Office 40 Barristers' Hall, Boston, Mass.

THE LARGEST, BEST AND CHEAPEST!

MOORE'S RURAL NEW-YORKER.

ER, the Great National Weekly for County, Suburban and Town Residents, will commence its Twentieth Year and Volume, Jan. 2, 1889, when it will be published on a Mammoth Sheet, containing Sixteen Large Double-Quarto Pages of Five Columns Each, and also *greatly improved in both Contents and Appearance.* This will make the Paper about DOUBLE ITS FORMER SIZE, with no increase in Price! Its ample pages will embrace Departments treating upon Agriculture, Horticulture, Literature, Rural Architecture, Education, Sheep Husbandry, Science and Art, Cotton Culture, New Inventions, Domestic Economy, Grazing, Breeding, Natural History, Dairy Farming, Travels, Topography, Poultry, Bees, General Intelligence, Landscape Gardening, News, Commerce, Entomology, The Markets, &c., &c.

Vol. XX, for 1889, will excel in all the essentials of a Progressive, Timely and Useful RURAL AND FAMILY NEWSPAPER—manifesting the true spirit of its Motto, "Excelsior," and Objects, "Progress and Improvement," and making the

BEST WEEKLY IN AMERICA!

This is no boast, for *we mean all we say or imply*; and all who have noted our promises and performances for twenty-five years,—while conducting the *Michigan Farmer*, (1833-1845), *Genesee Farmer*, (1846-1849), and the *RURAL NEW-YORKER* since Jan., 1850,—know that OUR PLEDGES ARE ALWAYS FULLY REDHEEMED.

With Offices in New York City and Rochester—the great Business and Commercial Metropolis, and the Heart of a famed Rural District—the RURAL has unequalled facilities.

The RURAL is not a monthly of only 12 issues a year, but a Large and Beautiful WEEKLY of 52 Numbers!

Whether located in Country, Village or City, *TOT, YOUR FAMILY, and NEIGHBORS*, want the RURAL for its superior in *SALE, PERITY and VARIETY* of Contents. *Adapted to the Wants of ALL.* Both People and Press pronounce the RURAL the *Best Paper in its Sphere.* Try it and see.

TERMS:—SINGLE COPY, \$3 a Year; Five Copies, \$14; Seven for \$19; Ten for \$23, &c. Now is the Time to Subscribe and form Clubs! Liberal inducements to Local Agents. Specimens, Show-bills, &c., sent free. P. O. Money Orders, Drafts and Registered Letters on our risk.

D. T. MOORE,

41 Park Row, New York, or Rochester, N. Y.

What Leading Journals Say.

The RURAL NEW-YORKER will henceforth be published simultaneously here and at Rochester. Its Editor, Mr. D. T. Moore, late Mayor of Rochester, has been nearly twenty years at the head, and has surrounded himself by a very able Corps of Assistants and Contributors. He has done a noble work for Agriculture in the West, and is now rapidly enlarging the field of his usefulness.—*N. Y. Tribune.*

The RURAL NEW-YORKER has now for nearly a score of years been an honor to journalism. Excellent and pure in its literary contents, abounding in the most valuable information on all matters pertaining to rural and suburban affairs, and tasteful to fastidiousness in its arrangement and letter press, its unrivalled success is assured.—*N. Y. Evening Post.*

An excellent and deservedly popular weekly. It is rich in contents, beautifully illustrated, and complete in all respects.—*New Orleans Picayune.*

Moore's RURAL opens rich, like a honey-comb, having sweets in every cell.—*New England Farmer.*

Can any one Beat This?

OLD SAYBROOK, Conn., Sept. 26, 1868.

Messrs. Wheeler & Wilson:

GENTLEMEN: I wish to say that I have in my family a "Wheeler & Wilson sewing machine," that has been in almost daily use for the past ten (10) years, and not a thing has ever been done to it in way of repairing; not a screw loose, or any part of it out of order in all that time. It has been used in making coats, vests, and pants, of the thickest of woolen goods, besides doing all kinds of family sewing, and is now, this day, the best machine for work I ever saw.

Can any one beat this?

Respectfully, GILBERT PRATT.

Any one who can beat this (and we think many can) will please address

MISSUS. WHEELER & WILSON,

No. 625 Broadway, New York.

PORTABLE STEAM ENGINES—

FOR FARM, MINING OR MECHANICAL PURPOSES. These machines require no brick work; mounted on legs they are especially adapted for use in MILL, SUGAR, FLOURING or PAINTING ROOMS,—or mounted on wheels they are adapted for outdoor work, THRESHING, WOOD SAWING, &c. See RURAL NEW-YORKER, Vol. XX, No. 1, 1888, first page.

37 Circulars with descriptions and prices furnished on application to A. N. WOOD & CO., Eaton, Madison Co., N. Y.

FREE! Our New Catalogue of Improved STENCIL DIES, MORE THAN \$200 A MONTH is being made with them.
